2014 Annual Caribou Report – Red Wine Mountain Herd		
Nalcor Doc. No.	Revision	Page
LCP-PT-MD-0000-EV-PL-0014-01	B1	3

1 PURPOSE

The purpose of this annual report is to provide a summary of the mitigation and monitoring efforts associated with the Lower Churchill Project (LCP) Species at Risk (SAR) Impacts Mitigation and Monitoring Plan, specifically the Red Wine Mountain (RWM) Caribou during 2014.

2 SCOPE

This annual report applies to the 2014 monitoring and mitigation efforts for the RWM Caribou Herd undertaken for the Lower Churchill Project as described in Section 6.0.

3 DEFINITIONS

Environmental Assessment: The evaluation of the Project's potential environmental risks and effects before it is carried out and identification of ways to improve project design and implementation to prevent, minimize, mitigate, or compensate for adverse environmental effects and to enhance positive effects. This includes the EIS (Nalcor 2009), subsequent Information Requests, and statements issued by Nalcor Energy (NE) during the course of the Environmental Assessment Hearings in 2011.

Environmental Management: The management of human interactions with the environment (e.g., air, water and land and all species that occupy these habitats including humans).

Environmental Management System: Part of LCP's management system used to develop and implement its environmental policy and manage its environmental aspects.

Environmental Protection Plan: Document outlining the specific mitigation measures, contingency plans and emergency response procedures to be implemented during the construction or operations of the Project.

Environmental Effects Monitoring: Monitoring of overall Project effects to confirm the predictions of the EIS (Nalcor 2009) and to fulfill commitments.

Environmental Compliance Monitoring: Monitoring of Project activities to confirm compliance with regulatory requirements and commitments.

4 ABBREVIATIONS & ACRONYMS

EA	Environmental Assessment
EIS	Environmental Impact Statement

6 PROJECT DESCRIPTION

6.1 MUSKRAT FALLS GENERATION

The Muskrat Falls Generation Project will include the following sub-components which are broken down under the five principal areas of the development:

- 22 km of access roads, including upgrading and new construction, and temporary bridges;
- A 1,500 person accommodations complex (for the construction period); and
- A north roller compacted concrete overflow dam;
- A south rockfill dam;
- River diversion during construction via the spillway;
- 5 vertical gate spillway;
- Reservoir preparation and reservoir clearing;
- Replacement of fish and terrestrial habitat;
- North spur stabilization works, and:
- A close coupled intake and powerhouse, including:
 - 4 intakes with gates and trash racks;
 - 4 turbine/generator units at approximately 206 MW each with associated ancillary electrical/mechanical and protection/control equipment;
 - 5 power transformers (includes 1 spare), located on the draft tube deck of the powerhouse; and
 - 2 overhead cranes each rated at 450 Tonnes

LCP-PT-MD-0000-EV-PL-0014-01	B1	6

Figure 6-1 Muskrat Falls Generating Facility

6.2 LABRADOR TRANSMISSION ASSET (LTA)

LTA consists of an AC transmission line system from Churchill Falls to Muskrat Falls, specifically:

- Churchill Falls switchyard extension;
- Muskrat Falls switchyard;
- Transmission lines from Muskrat Falls to Churchill Falls: double-circuit 315 kV ac, 3 phase lines, double bundle conductor, single circuit galvanized lattice steel guyed suspension and rigid angle towers; 247 km long;
- 735 kV transmission line at Churchill Falls interconnecting the existing and the new Churchill Falls switchyards; and
- Labrador Fibre Project (Nalcor's participation in Aliant led initiative).

Figure 6-2 presents the LTA.

7 CARIBOU

7.1 EXISTING INFORMATION

As described in Nalcor (2009) woodland caribou (*Rangifer caribou*) are an important cultural, economic, and ecosystem component in Labrador, supplying a hunting resource for residents and prey for wildlife. Caribou within Labrador are classified as one of three ecotypes: (i) sedentary, (ii) migratory, or (iii) montane (Bergerud et al. 2008; Boulet et al. 2005; Thomas and Gray 2002). Sedentary caribou are the forest dwelling ecotype that undergoes a seasonal dispersion (rather than migration) during calving (Bergerud et al. 2008).

2014 Annual Caribou Report – Red Wine Mountain Herd		
Nalcor Doc. No.	Revision	Page
LCP-PT-MD-0000-EV-PL-0014-01	B1	8

Sedentary populations of woodland caribou in the province are considered Threatened under the NLESA, and occur in the lower Churchill River watershed. Sedentary herds that occur in the vicinity of the Project include the RWM Herd and the Mealy Mountains Herd (MMH), which includes the Joir River Herd (JRH) subpopulation (Bergerud et al. 2008). Of greatest concern for the Project is the RWM herd, which has a current range that overlaps with the Project. The RWM Herd was considered stable in the 1980s but declined dramatically to 151 animals in 1997 (Schaefer et al. 1999) with a further decrease to 87 animals by 2003 (NLDEC 2010, internet site). The JRH and MMH occur outside the physical footprint of the Project. The latest survey of the Red Wine Mountain Caribou sub population, traditionally found in the northern part of the Red Wine Mountain, indicates this herd is at its all-time low of approximately 20 animals (GNL 2015).

7.2 MITIGATION AND MONITORING

As described in the Lower Churchill Project (LCP) Species at Risk (SAR) Impacts Mitigation and Monitoring Plan (IMMP), the effects management measures (i.e., mitigation measures outlined in the EIS [Nalcor 2009]) the LCP Integrated Generation and Labrador Transmission Assets Environmental Protection Plan (Nalcor 2013), and the commitments made by the Project during the Information Request responses and the environmental assessment hearings to ensure regulatory compliance of the above discussed Acts and regulations included:

- All site personnel shall receive training to recognize any Endangered, Threatened or Vulnerable species of plant or animal and its habitat prior to the start of clearing and any other site activities;
- Personal pets are not permitted on the construction site;
- Buffer zones (of various distances) shall be implemented to protect wildlife at the site;
- Hunting is prohibited at the construction site. All Project participants shall be prohibited from hunting at the construction site while working on the Project;
- Under no circumstances are wildlife to be fed and all measures shall be taken to avoid inadvertent feeding;
- Wildlife shall not be chased, caught, diverted, followed or otherwise harassed by Project participants;
- All wildlife sightings and nuisance wildlife shall be reported to the On-Site Environmental Monitor (OSEM) who will oversee various mitigation measures and collect observation and other monitoring data related to wildlife;
- The Forestry Branch shall be contacted and updated with regards to nuisance wildlife and wildlife encounters;
- Equipment and vehicles shall yield the right-of-way to wildlife and adhere to construction site speed limits. Speed limits associated with Project access roads vary from 10 – 60 km/hr, and are

2014 Annual Caribou Report – Red Wine Mountain Herd		
Nalcor Doc. No.	Revision	Page
LCP-PT-MD-0000-EV-PL-0014-01	B1	9

set as per the regulatory requirements set by the Department of Transportation and Works. LCP enforces speed limits on all Project roads;

- LCP will create breaks every 500 m in snow berms alongside roads to enable caribou crossings;
- Where possible, the design of ROW will provide clear sightlines for caribou across the width of the ROW;
- Environmental awareness training, with regular briefings, shall be implemented for all personnel;
- Firearms shall not be permitted on site, with exception of approved bear monitors;
- Where possible, scheduling of activities will be limited and adaptable during calving and post-calving periods as well as during sensitive periods in the winter for caribou (LCP will consult with the NLENCC-WD in such instances);
- Maintain higher flight altitudes (300 agl or higher) during the ‘critical’ periods (as defined below as sensitive periods) during flights and monitoring programs. If caribou are startled ascend to a higher flight path or veer away.
- When caribou (based on collar or observational data) occupy an area under construction/development, LCP will contact the NLENCC-WD to determine if appropriate mitigation can be put into place or if activities must be suspended at that location (see below);
- When roads not essential to long-term maintenance are not needed, they will be decommissioned, habitat stabilized, and access shall be restricted;
- Temporary decommissioning of access roads may be considered if Project construction is considerably delayed;
- If access roads are deemed to be necessary during the operations and maintenance phase of the Project, LCP will consult with NLENCC-WD regarding the implementation of access control measures;
- The LCP will continue its participation as an observer on the Labrador Woodland Caribou Recovery Team regarding the RWM Herd and support of related research such as the telemetry monitoring program; and
- If necessary, access control measures will be applied in certain areas associated with facilities and/or ongoing activities to prevent disturbance of individual caribou:
 - the reservoir preparation approach will be mostly river based, thereby reducing the need for access from the TLH
 - existing access points will be used;
 - signage in the Project area will be used to deter access; and
 - site security will be in place during construction at the South Side Access Road and other Project locations to restrict public access.

2014 Annual Caribou Report – Red Wine Mountain Herd		
Nalcor Doc. No.	Revision	Page
LCP-PT-MD-0000-EV-PL-0014-01	B1	10

As stated in the SAR IMMP, LCP committed to supporting the deployment of additional collars on the RWM Herd. In 2014, 3 collars were deployed.

Weekly telemetry of Red Wine Mountain Herd individuals within 20 km of the Project are provided to LCP who map the locations and issue advisories on the approximate location of RWM caribou with respect to Project activities. Depending on the proximity of caribou observations from the Project, different mitigation scenarios were then applied.

The following describes specific potential interaction scenarios and the associated mitigation:

- **Scenario 1** – Caribou **within 20 km** of Project activities (based on satellite telemetry or other reports)
 - OSEM will conduct weekly visual surveys of 10 km radius around each activity from road-accessible vantage points for caribou or signs of caribou (i.e., winter craters, tracks or scat)
 - If present, wildlife observations will be included in the weekly environmental report to be sent to NLENCC-WD in Corner Brook (whenever Project activities are ongoing), and such information will be presented during environmental awareness training and regular briefings for all personnel
- **Scenario 2** – Caribou **within 5 km** of Project activities (based on satellite telemetry or other reports)
 - OSEM to issue advisory to all Project personnel that all sightings of caribou to be reported immediately to the OSEM. The OSEM will then immediately notify all vehicle operators.
 - OSEM will conduct daily visual surveys of 10 km radius around each activity from road-accessible vantage points for caribou or signs of caribou (i.e., winter craters, tracks or scat).
 - If present, wildlife observations will be included in the weekly environmental report to be sent to NLENCC-WD in Corner Brook
- **Scenario 3** – Caribou present during sensitive time periods
 - To reduce disturbance to caribou during the late winter and late pregnancy periods, NLENCC-WD has identified two sensitive time periods during which Project activities may be restricted, delayed or minimized:
 - 1) A cautionary period (late winter) – February 3 to April 15
 - If Project activities are to occur within 4 km of the known presence of caribou based on satellite telemetry or other reports, work activities are to be rescheduled.
 - 2) A critical period (calving/immediately post-calving) – May 30 to July 15
 - No Project activities are permitted within important and highly used core calving areas.

2014 Annual Caribou Report – Red Wine Mountain Herd		
Nalcor Doc. No.	Revision	Page
LCP-PT-MD-0000-EV-PL-0014-01	B1	11

- No blasting is to occur within a 2.5 km buffer of the core calving areas.
- **Scenario 4** – Blasting at the Main Site at Muskrat Falls
 - Prior to blasting, the OSEM will conduct a visual survey
 - If caribou are within 3 km of the site, blasting will be delayed until caribou have left the area
 - Methods to encourage caribou to leave the area may be implemented in consultation with NLENCC-WD
 - Note, if LCP can demonstrate the planned blasting activity will not likely result in a behavioural response by caribou, the 3 km radius may be reduced.
- **Scenario 5** – Other Project activities (e.g., grubbing, grading and leveling, laydown and storage of equipment and material in existing areas, generators to support the activity, vehicle and heavy equipment use, handling and transfer of fuel and other hazardous material, waste disposal, sewage disposal and hazardous waste disposal, localized and low intensity blasting, tower erection and conductor stringing)
 - As these activities would not be audible beyond a short distance, if caribou are observed within 500 m of such an activity, the OSEM will determine if the activity will be delayed or curtailed
 - Wildlife interactions will be included in the weekly environmental report to be sent to NLENCC-WD

Aerial Winter Survey

An aerial strip transect survey was completed over a three-day period between February 18 and February 21, 2014, and collars were deployed on February 21. Weather conditions encountered during surveys were ideal for aerial observations and collar deployment. Only three caribou were observed during 50 transects flown in 2014. Two of the caribou observed during strip transect surveys were successfully captured and collared (one male and one female). Both captured/collared caribou were believed to be in good body condition, and showed no sign of *Besnoitia* sp. infection.

Aerial transect surveys are an effective means of assessing ungulate populations, and may be particularly important for species of conservation concern, such as Red Wine Mountains Caribou (*Rangifer tarandus*). Results from the 2014 field program provide preliminary information on numbers, age and sex characteristics, distribution, and habitat use of caribou from the RWMH. This information will be used in combination with results of future surveys and collaring initiatives, to assess the movement and distribution patterns of RWMH caribou in relation to Project activities.

7.3 REPORTING

A compilation of daily environmental reports were submitted to NLENCC-WD on a weekly basis. These reports provide a synopsis of completed activities, and a weekly look-ahead.

Throughout the 2014 construction year, LCP maintained frequent communications with the provincial NLENCC-WD regarding the movements of RWM Herd individuals within or near the Project area.

In addition to the high level weekly report, LCP also submitted a detailed Threatened Caribou Report weekly. This report presented the results of the telemetry observations, the mitigation scenario that applied, and the results of the surveys completed by the on-site environmental monitors, and any

other surveys and observations recorded by project personnel. As the telemetry results are confidential, Table 1 provides a summary of the contents of the reports submitted to NLENCC-WD in 2014.
