.22 Wiring interconnection diagrams showing interconnecting cable between each piece of equipment and termination details for each of the cables. Interconnection drawings shall be furnished for all control and power cable to be installed by Contractor;

.23 Controller program details shall be submitted for review and approval. The programming shall be fully annotated with sufficient information for determining operation of the system. Flow type logic diagrams of the control system showing all logic flow from the controlling devices to the controlled devices;

.24 Match marking drawings;

.25 Nameplates;

.26 Foundation Loadings: Diagrams shall be provided for loads transferred from trash cleaning system to the supporting runway structure at the Intake, Centre Transition Dam and Spillway for all load cases.

3.22.4 Catalogue Data

.1 Product specifications, descriptive literature, and performance data for items of standard manufacture.

3.22.5 Spare Parts Lists

.1 Required Capital Spare Parts shall be provided as follows:

.1 One (1) HPU motor and pump;

.2 Two (2) sets replaceable plastic scrapers on the cleaning head, along with fasteners;

.3 Four (4) hydraulic quick connects of each size and type;

.4 One (1) gantry drive motor;

.5 Two (2) complete sets of each type of brake shoes;

.6 Two (2) sets of wheel bearings;

.7 One (1) set of bearings for the rotating platform;

.2 A Recommended Spare Parts list shall be provided by Contractor, and shall list and price components individually for possible purchase at Engineer's option as a part of the Contract.

.3 All Spare Parts shall be interchangeable with, and of the same materials and workmanship as the corresponding parts of the equipment furnished.

.4 Capital Spare Parts and Spare Parts ordered by Engineer shall be individually packaged for indefinite storage indoors at the powerhouse, and each part shall be marked with its description and purpose on the outside of the packaging.

.5 Capital Spare Parts and Recommended Spare Parts ordered by Engineer shall be delivered into stores as directed by Engineer. Delivery shall be deemed to be complete when the packages have been opened by Contractor, their contents checked by a representative of Engineer and the parts re-protected and repacked by Contractor to the satisfaction of Engineer.

.6 Where Spare Parts have been used by Contractor during the construction, Commissioning or guarantee periods, such Spare Parts shall be replaced by Contractor at its own cost at the earliest possible date.

.7 Contractor shall maintain at Worksite an adequate supply of spare parts for commissioning to avoid any schedule delay.

3.22.6 Tools

.1 Contractor shall provide any specialty tools used for the initial installation of the equipment and necessary for dismantling, adjustment and maintenance of the equipment. The cost of these tools shall be included in the Contract Price and shall be handed over to Engineer after Commissioning.

.2 Each tool shall be in good working condition and marked with its size and/or purpose. If, in the opinion of Engineer, any tool is excessively worn or damaged when handed over, Contractor shall provide an adequate replacement. Tools shall be stored in a suitable container.

3.22.7 Reports and Documentation

.1 Work Plans

.1 Submit detailed Work Plans for erection of the trash cleaning system, including a description of work activities, illustrative diagrams, and schedule.

.2 Submit detailed Work Plans for installation and testing of the trash cleaning system along with Contractor's Shop Drawings to demonstrate that the proposed design is consistent with the intended approach regarding installation and testing.

.2 Material test certificates (mechanical and chemical properties)

.3 Shop and Field Inspection Plan: Submit Contractor's plan of inspection to be performed at key stages of assembly and testing of equipment, with applicable illustrations, diagrams, check sheets, and procedures, for fit-up, dimensional correctness, alignment, and sequential checkout, startup, testing, and operation of equipment.

.4 Shop test report: Shop test record, including shop assembly and inspection check sheets for fit-up, dimensional correctness, alignment, functional tests, and other checks.

.5 Certification Records: Submit copies of all shop and field inspection records and reports.

.6 Packing and shipping procedures

.7 Installation instructions

.8 Operation and Maintenance Manuals: Submit complete sets of O&M manuals containing the manufacturer's operating and maintenance instructions for each piece of equipment and the integrated trash cleaning system.

PART 4 PRODUCTS

4.1 MACHINE GUARDS

4.1.1 All exposed moving parts shall be provided with guards in accordance with the applicable safety requirements. Such safety devices shall meet or exceed federal, state and municipal requirements.

4.1.2 The Contractor shall furnish equipment with suitable guards and safety devices designed to protect persons against contact with moving parts and hazardous surfaces.

4.1.3 Fabricate guards of 2 mm (minimum) steel, 13 mm opening in expanded metal screen to provide visual inspection of moving parts without removal of the guard.

4.1.4 Guards shall be painted after fabrication and shall be designed to be readily removable to facilitate maintenance of moving parts.

4.1.5 Openings shall be provided in the guard for access to the lubricating fittings and may require provisions to extend lube fittings through guards.

4.1.6 Cut-outs and holes through guard screen shall be reinforced.

4.2 HYDRAULIC PRESSURE SYSTEM

4.2.1 Hydraulic Pressure Unit, (HPU)

.1 The HPU reservoir shall be sized for a minimum active volume of two hundred percent (200%) of rod return volume. The HPU reservoir shall be Joint Industry Conference (JIC) type and shall be designed to prevent the intrusion of foreign matter and precipitation water.

.2 Fluid level shall be visible in a sight gage over the normal operating range with high and low levels marked.

.3 A filler-breather assembly, filling strainer, drain valve, and air filter shall be provided. Intake and return lines shall be routed to near the bottom of the reservoir.

.4 Means for accessing the tank interior shall be provided such that the entire interior can be inspected and cleaned.

.5 The reservoir interior shall be painted with a multiple coat oil-resistant paint system, per the manufacturer's standard practice.

.6 A low level alarm float switch and an extreme low oil level pump shutoff switch shall be provided, in addition to all pressure switches required for pump control.

.7 A reservoir temperature switch shall be furnished and installed.

.8 The system shall allow gravity drainage of ninety-eight percent (98%) of the oil volume.

.9 A low watt density electric heater shall be provided to maintain temperature in the HPU above 15°C with the minimum ambient air temperature specified herein.

.10 An oil cooler shall be provided to limit the maximum oil operating temperature to 65°C with the maximum ambient air temperature specified herein.

4.2.2 Hydraulic Cylinders

.1 Hydraulic cylinders shall be of welded marine grade (suitable for wet locations) construction.

.2 The rod shall be 17-4 pH stainless steel, grade H-1100 with a hard chrome plate 0.025 mm minimum thickness after grinding and polishing to a 0.2032 µm (micron) finish.

.3 Cylinder working pressure shall not to be less than one hundred fifty percent (150%) of the rated system operating pressure.

4.2.3 Hydraulic Tubing and Fittings

.1 Hydraulic tubing shall be seamless Type 304 stainless steel tubing aircraft quality per MIL-T or AMS specifications.

.2 Fittings shall be bite-type compression fitting, SWAGELOK or equal. Tubing sizes shall be sufficient to meet pump manufacturer's suction pressure requirements and to prevent starvation, undue temperature rise or pressure losses.

.3 Fluid velocities shall be 1.2 m/s maximum in suction lines and 3 m/s maximum in other lines. Tubing clamps shall be Parker Parklamp Standard and Twin series clamps or equal.

.4 Attach clamps shall be attached to steel structures by welding with clamp weld plates or by threaded fasteners and clamp mounting rails.

.5 Tubing clamps shall be provided within 0.3 m of all tube terminations and every 2.4 m, along each tubing run.

4.2.4 Hydraulic Hose and Fittings

.1 Hose shall have a minimum burst pressure of four (4) times the operating pressure.

.2 Hose shall be provided at connections to each hydraulic cylinder or as needed to limit excessive loading on tube sections.

.3 Fittings shall be quick disconnect, non-spill stainless steel, Parker FS Series 316 Non-Spill, or equal, fitting size to match hose size.

4.2.5 Hydraulic Pumps and Motors

.1 Pumps shall be variable volume piston pumps (Parker Series PV or an alternative Accepted by Engineer) with a minimum capacity of one hundred ten percent (110%) percent of the maximum calculated system oil requirement at the rated operating pressure.

.2 For motor requirements, see Section 26 05 81 – Motors 1 to 250 hp.

4.2.6 Accessories

.1 A pressure relief valve shall be provided on the discharge side of the pump.

.2 A 10 micron filter shall be provided on the pump outlet, and a fine mesh filter shall be provided on the pump inlet.

.3 Dirty filter alarms shall be provided.

.4 A minimum 76.2 mm diameter liquid filled pressure gage with shutoff valve and snubber, visible from the front of the enclosure, shall be provided for monitoring system pressure.

4.2.7 Hydraulic Equipment Enclosure

.1 The hydraulic equipment shall be contained within the overall machinery enclosure in a manner that prevents oil mist and vapours from contaminating electrical devices, walkway areas and other non-hydraulic equipment in the overall machinery enclosure.

.2 The hydraulic equipment enclosure shall be a steel enclosure (or partition within the overall machinery enclosure) that contains the pumps, motors, control valves, and other devices.

4.2.8 HPU Power and Controls

.1 Motor power feeds, control power, and instrumentation cabling should be adequately separated from each other. Remote device connections shall be terminated at a terminal strip in the control enclosure, labelled to correspond to the electrical connection diagram.

.2 Local controls and indication shall be provided for the following:

.1 Indicating lights to show pump operation (ON/OFF);

.2 Indicating lights to show low system pressure alarm;

.3 Indicating light to show low reservoir level alarm;

.4 Indicating light to show high reservoir temperature;

.5 Hand-Off-Auto control switch(es) for manual operation of pump(s).

4.3 GANTRY DRIVE

4.3.1 Brake Control

.1 Type: Electrically released, spring set brakes, released by means of an electro-mechanical contactor that supplies full voltage to the brake coil when a directional command is issued.

.2 Brake Operation: Upon release of a directional command, one (1) of the following sequences shall occur:

.1 Brake sets immediately due to de-energizing of the brake contactor and the controller immediately goes to zero (0) output;

.2 Controller decelerates the motor to zero (0) speed using dynamic braking over a programmable time ramp and then sets the holding brake by de energizing the brake contactor;

.3 Selection of either of the above brake operating methods is programmable.

4.4 COATINGS SCHEDULE

4.4.1 Coating and galvanizing shall conform to Section 48 13 10, Clause 5.2.8.

4.4.2 Coatings shall be as follows:

Main Structure	All surfaces Epoxy paint colour XXX
Hydraulic arm and any submerged parts	Hot dip galvanized
All accessories, such as ladders, walkways, platforms, handrails/guard rails and all hardware, not forming integral part of the main structure and liable of being dismantled, such as connection bolts, supports, heating equipment, pipes, etc.	Hot dip galvanized
Hydraulic equipment	Different colour than the main structure
Safety equipment	Epoxy paint colour XXX

4.4.3 Surface preparation and application shall be as specified in Section 48 13 10, Clause 5.2.8.

4.4.4 Colour schedule to be provided by Company.

PART 5 EXECUTION

5.1 TOLERANCE

5.1.1 Tolerances shall be selected by Contractor to meet the precision required for the proper operation of the equipment, considering the nature and function of the part. All tolerances shall be indicated on Contractor's Shop Drawings and submitted for review.

5.1.2 Contractor shall establish finer shop tolerances, if necessary, to meet the specified performance or operational requirements or for interchangeability of spare parts. All tolerances shall be selected with due considerations to the nature and function of the parts and to the corresponding accuracy required to secure proper operation, but shall not exceed the tolerances specified.

5.2 PRESERVATION, MECHANICAL COMPLETION AND COMMISSIONING REQUIREMENTS

D1

5.2.1 Preservation, mechanical completion and commissioning requirements noted herein are defined in MFA-SN-CD-2000-ME-SP-0002-01 – Preservation, Mechanical Completion, Commissioning Requirements.

5.3 FIELD TRAINING

5.3.1 Field training for Company's operating staff shall be carried out on site by qualified individuals familiar with the installation, operation, and maintenance of the trash cleaning system furnished under this Contract.

5.3.2 An individual from the trash cleaning system manufacturer shall conduct the training.

5.3.3 Training shall be required for twelve (12) Company employees during two (2) sessions of approximately eight (8) hours before the trash cleaning system is ready for the Diversion Phase.

5.3.4 Training shall be required for twelve (12) Company employees during two (2) sessions of approximately eight (8) hours when the trash cleaning system if ready for turnover for Substantial Completion of the project.

5.3.5 Field Training Operations and Maintenance (O&M) Manuals shall be provided for each employee participating in the training.

5.3.6 Company reserves the right to record such training for future internal use.

5.3.7 Training shall include:

.1 Classroom activities and hands-on type training with the actual equipment;

.2 Operating and troubleshooting the equipment to return it to service;

.3 All required maintenance activities; including preventative maintenance as well as corrective procedures.

LEGEND

CCTV — CLOSED CIRCUIT TELEVISION
SACS — SECURITY AND ACCESS CONTROL SYSTEM
PLC — PROGRAMMABLE LOGIC CONTROLLER
HMI — HUMAN — MACHINE INTERFACE
ODF — OPTICAL DISTRIBUTION FRAME
ADSS — ALL DIELECTRIC SELF SUPPORTED
F.O. — FIBER OPTIC
MCC — MOTOR CONTROL CENTER
DCS — DISTRIBUTED CONTROL SYSTEM
LAN — LOCAL AREA NETWORK
———— — NEW CONNECTIONS OR EQUIPMENT BY CH0031.

NOTES:

1. DUAL (REDUNDANT) COMMUNICATION PROTOCOL LINKS WITH THE CRITICAL ALARMS HARDWIRED SHALL BE PROVIDED BETWEEN EACH GATE PLC AND THE SPILLWAY CONTROL PANEL.
2. IT SHALL BE POSSIBLE TO MONITOR AND CONTROL THE SPILLWAY GATES FROM THE SPILLWAY CONTROL PANEL.
3. IT SHALL BE POSSIBLE TO MONITOR AND CONTROL THE SPILLWAY GATES FROM THE ECC (ENERGY CONTROL CENTER) LOCATED IN ST. JOHN'S, OR THE POWERHOUSE CONTROL ROOM (RAISE/LOWER).
4. TELECOMMUNICATION PANELS SUPPLIED, INSTALLED AND CONFIGURED BY CD0510.
5. SUPPLIED AND INSTALLED BY CH0031.
6. SUPPLIED AND INSTALLED BY CH0030.
7. CD0510, CH0030 AND CH0031 ARE COMMITMENT PACKAGE NUMBERS.
8. GATE PLC SHALL CONTROL MCC CONTACTORS.
9. HORN BLOWING SHALL BE A PRE-CONDITION TO GATE OPENING. AUTOMATIC AND MANUAL GATE OPERATION SHALL BE INTERLOCKED WITH THE HORN.
10. CHANGES/ADDITIONS TO THE EQUIPMENT INSTALLED AT DIVERSION PHASE SHALL BE PART OF CH0031 SCOPE OF WORK.
11. THE SPILLWAY CONTROLLER SHALL BE PROVIDED WITH DUAL (REDUNDANT) COMMUNICATION LINKS TO THE POWERHOUSE LAN.
12. THE DCS TELECOMMUNICATION PANEL SHALL BE PROVIDED WITH REDUNDANT ETHERNET SWITCHES FOR CONNECTION TO THE POWERHOUSE REDUNDANT LAN.

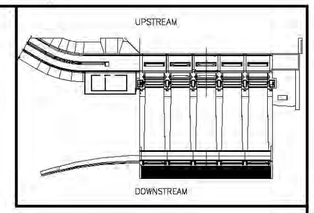
HOIST HOUSE PLAN



NOTES:

1. SWING DOOR SHALL ALLOW CAMERA & WARNING HORN MAINTENANCE FROM INSIDE THE TOWER. DOOR SHALL SWING INSIDE AND BE LOCKABLE IN CLOSED POSITION.
2. ALL CABLES TO CAMERAS & WARNING HORNS SHALL BE INSTALLED IN CABLE TRAYS UP TO THE JUNCTION BOX.
3. FOR SPILLWAY ELECTRICAL ROOM CAMERAS, TELEPHONES AND ACCESS CONTROL EQUIPMENT, SEE DWG: MFA-SN-CD-3340-EL-DD-0045-01 (505573-3243-47DD-0107)
4. JUNCTION BOX, INSULATED ON ALL FACES AND COMPLETE WITH FIBRE OPTIC PATCH PANEL, DIGITAL DISTRIBUTION FRAME, HEATER & COMMUNICATION SWITCH.
5. DATA OUTLETS & CAMERAS IN HOIST HOUSE SHALL BE CONNECTED TO TELECOM JUNCTION BOX.
6. ALL CABLE ARMOUR TO BE CONNECTED TO GROUND BAR LOCATED IN THE JUNCTION BOXES AT BOTH ENDS OF ALL CABLE RUNS.
7. CAMERA MODEL TO BE DEFINED LATER.

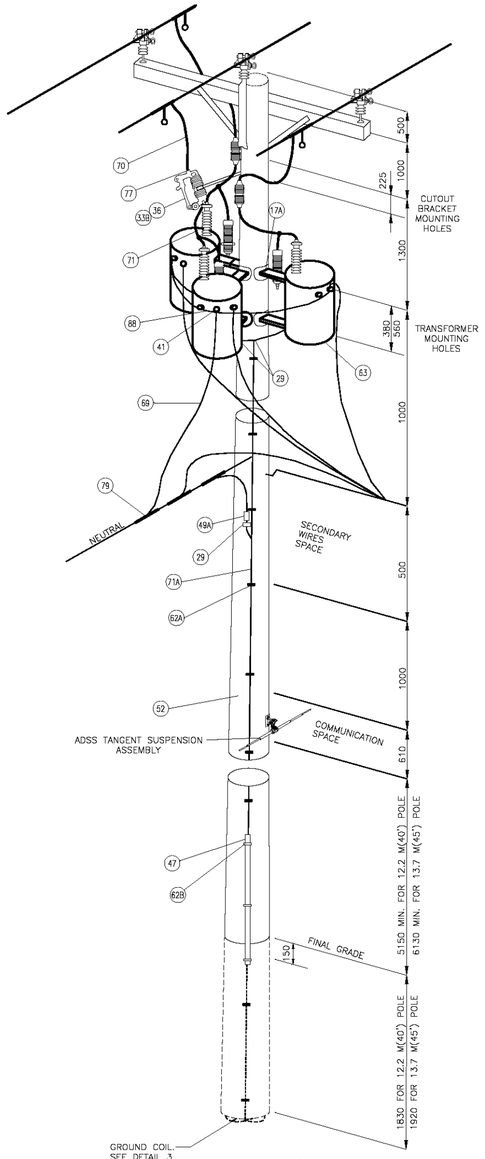
CUTOUT CLUSTER MOUNTING DETAILS TANGENT TYPE STRUCTURE

DETAIL 2 NOTES:

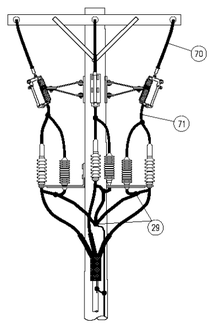
1. REFER TO DETAIL 3 FOR STANDARD GROUND COIL INSTALLATION DETAILS.
2. GROUND ROD TO BE USED WHERE IT IS IMPRACTICAL TO INSTALL GROUND COIL.
3. TANK STRAP OR EQUIVALENT JUMPER MOST BE SECURED, CONNECTING TANK TO SECONDARY NEUTRAL TERMINAL.
4. THE TRANSFORMER PRIMARY WINDING NEUTRAL (H2) IS ELECTRICALLY CONNECTED TO TRF. TANK INTERNALLY, THEREFORE, THE PRIMARY NEUTRAL TERMINALS (H2) SHALL BE JUMPERED TOGETHER AND CONNECTED DIRECTLY TO SYSTEM NEUTRAL CONDUCTOR. EACH TRANSFORMER TANK GROUND WIRE SHALL BE SEPARATELY CONNECTED TO THE POLE GROUND AND A JUMPER ADDED BETWEEN THE POLE GROUND AND THE SYSTEM NEUTRAL CONDUCTOR.
5. "PENETROX" TO BE ADDED TO CONTACT SURFACES AND SCRATCH INTO SURFACES USING WIRE BRUSH BEFORE MAKING CONNECTIONS.
6. INSTALLATION OF THE 25 kV POLE STRUCTURE INCLUDING FUSE CUTOUTS, FUSELINK, TRANSFORMERS AND WIRING TO PRIMARY OF TRANSFORMERS ARE BY OTHERS.

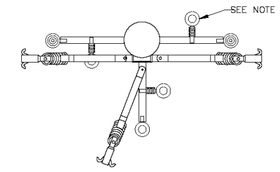


INSTALLATION ON TANGENT TYPE STRUCTURE

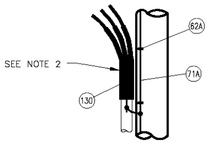
DETAIL 2 – TYPICAL 25 kV CLUSTER MOUNTED THREE PHASE TRANSFORMER INSTALLATION

N.T.S.





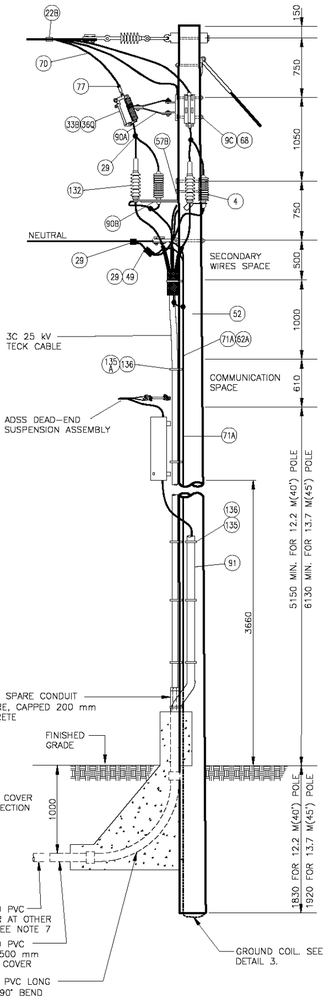
CUTOUT, TERMINATOR & ARRESTOR ARRANGEMENT

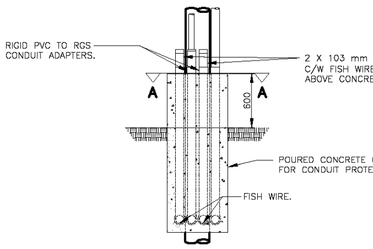


CABLE BREAKOUT DETAILS

DETAIL 1 NOTES:

1. BENDING RADIUS OF CABLE SHALL NOT BE LESS THAN 8 TIMES OUTSIDE DIAMETER OF CABLE. NO BENDS PERMITTED WITHIN 150 mm OF BOTTOM OF TERMINATOR.
2. REFER TO MANUFACTURER'S INSTRUCTIONS FOR DETAILS OF CABLE TERMINATION KIT.
3. SUPPORT CONDUIT AND ARMOURED CABLE AT 1.2 M INTERVALS.
4. INSTALL RISER POLE ARRESTER ON THE TERMINATOR BRACKET AS SHOWN.
5. GROUND ROD TO BE USED WHERE IT IS IMPRACTICAL TO INSTALL GROUND COIL.
6. THE CONDUIT CONTAINING THE CABLES SHALL BE SEALED WITH AIRSEAL.
7. FOR CONTINUATION OF CABLE AND CONDUIT IN TRENCH, SEE REFERENCE DWG. MFA-SN-CD-2440-EL-LT-0008-01.
8. INSTALLATION OF 25 kV TERMINATION POLE INCLUDING THE FUSE CUTOUTS, FUSELINK AND WIRING TO THE LINE SIDE OF THE FUSE CUTOUTS IS BY OTHERS.
9. INSTALLATION AND TERMINATION OF THE ADSS IN THE SPILLWAY ELECTRICAL ROOM IS BY OTHERS.





DUCT INSTALLATION DETAILS AT RISER POLE

NOTES

1. ALL LOAD RATINGS ARE PRELIMINARY. LOAD RATINGS WILL BE FINALIZED BASED ON SUPPLIER DATA SHEETS.
2. ALL CB AND BUS RATINGS, CABLE SIZES AND TRANSFORMER RATINGS ARE PRELIMINARY. DEVICE RATINGS AND CABLE SIZES WILL BE REVISED ACCORDING TO SUPPLIER LOAD LISTS.
3. ALL GATES WILL HAVE HEATERS, BUT ONLY 3 GATES TO BE HEATED AT ANY ONE TIME FROM NORMAL POWER SUPPLY.
4. ALL GATES WILL HAVE THE HEATERS, BUT ONLY 2 GATES TO BE HEATED AT ANY ONE TIME FROM EMERGENCY DIESEL GENERATOR.
5. CONTACTOR SIZE AS PER NEMA STANDARDS BASED ON FULL LOAD AMPERES.
6. EACH MCC TO BE SUPPLIED WITH 20% EQUIPPED SPARE FEEDERS (MINIMUM OF 2, NOT SHOWN).
7. SUPPLIED UNDER CH0030.
8. SUPPLIED UNDER CH0031.
9. MOLDED CASE CIRCUIT BREAKER RATINGS SHOWN ARE TRIP UNIT RATINGS

LEGEND

- 27 — UNDER VOLTAGE RELAY
- 51N — AC INVERSE DEFINATE NEUTRAL OVERCURRENT RELAY
- 86 — LOCK-OUT RELAY
- 42 — MAGNETIC CONTACTOR.
- VS — VOLTAGE SELECTOR SWITCH
- AS — AMPERE SELECTOR SWITCH
- ATD — AMPERE TRANSDUCER
- VTD — VOLTAGE TRANSDUCER
- 1 — MAGNETIC CONTACTOR, NUMBER INDICATES NEMA RATING.
- DCS — DISTRIBUTED CONTROL SYSTEM.
- MCP — MOTOR CIRCUIT PROTECTOR
- CC — CONTROL SUPPLY MONITORING RELAY.
- CE — OVERLOAD RELAY.
- X1 — CT TEST TERMINAL BLOCK
- X2 — PT TEST TERMINAL BLOCK

CRITERIA FOR AUTO TRANSFER

1. TWO INCOMERS SHALL NOT BE PARALLELED AT ANY TIME.
2. CB1 IS NORMALLY CLOSED.
3. CB2 IS NORMALLY OPEN.
4. WHEN CB1 INCOMER SUPPLY FAILS, AFTER SOME TIME DELAY AUTO TRANSFER SHALL OPEN CB1 BREAKER FIRST, START DG AND THEN CLOSE CB2 BREAKER TO KEEP BUS ENERGIZED.
5. PROTECTION TRIP OF RESPECTIVE BREAKER (ANY INCOMER) SHOULD BLOCK THE AUTO TRANSFER.
6. AUTO TRANSFER SHALL BE BLOCKED WHEN AUTO/MANUAL SELECTOR SWITCH (AUTO TRANSFER) MOUNTED ON MCC IS IN MANUAL MODE.
7. SPILLWAY MAIN SWG/MCC SHALL BE EQUIPPED WITH POWER MANAGEMENT SYSTEM TO LIMIT THE ESSENTIAL LOAD TO A MAXIMUM OF 800kW WHEN OPERATING ON DIESEL GENERATOR.

NOTES

1. ALL LOAD RATINGS ARE PRELIMINARY. LOAD RATINGS WILL BE FINALIZED BASED ON SUPPLIER DATA SHEETS.
2. ALL CB AND BUS RATINGS, CABLE SIZES AND TRANSFORMER RATINGS ARE PRELIMINARY. DEVICE RATINGS AND CABLE SIZES WILL BE REVISED ACCORDING TO SUPPLIER LOAD LISTS.
3. ALL GATES WILL HAVE HEATERS, BUT ONLY 3 GATES TO BE HEATED AT ANY ONE TIME FROM NORMAL POWER SUPPLY.
4. ALL GATES WILL HAVE THE HEATERS, BUT ONLY 2 GATES TO BE HEATED AT ANY ONE TIME FROM EMERGENCY DIESEL GENERATOR.
5. CONTACTOR SIZE AS PER NEMA STANDARDS BASED ON FULL LOAD AMPERES, CONTACTORS FOR RADIANT HEATERS ARE TO BE TIMER CONTROLLED.
6. EACH MCC TO BE SUPPLIED WITH 20% EQUIPPED SPARE FEEDERS (MINIMUM OF 2, NOT SHOWN).
7. MOLDED CASE CIRCUIT BREAKER RATINGS SHOWN ARE TRIP UNIT RATINGS.

NOTES

1. ALL LOAD RATINGS ARE PRELIMINARY. LOAD RATINGS WILL BE FINALIZED BASED ON SUPPLIER DATA SHEETS.
2. ALL CB AND BUS RATINGS, CABLE SIZES AND TRANSFORMER RATINGS ARE PRELIMINARY. DEVICE RATINGS AND CABLE SIZES WILL BE REVISED ACCORDING TO SUPPLIER LOAD LISTS.
3. CONTACTOR SIZE AS PER NEMA STANDARDS BASED ON FULL LOAD AMPERES. ALL CONTACTORS FOR RADIANT HEATERS ARE TO BE CONTROLLED BY TIMERS.
4. EACH MCC TO BE SUPPLIED WITH 20% EQUIPPED SPARE FEEDERS (MINIMUM OF 2, NOT SHOWN).
5. ALL POWER CABLES SHALL BE TECK90 TYPE UNLESS OTHERWISE INDICATED.
6. ALL INTAKE HOIST MCC'S AND INTAKE GATE LOADS WILL BE SUPPLIED AND INSTALLED BY PACKAGE CH0032.
7. I/O LIST ARE APPLICABLE FOR BOTH MAIN AND GATE MCC'S.
8. BREAKER EQUIPPED WITH NO PROTECTIVE ELEMENT.
9. MOLDED CASE CIRCUIT BREAKER RATINGS SHOWN ARE TRIP UNIT RATINGS.
10. ALL REMAINING EQUIPMENT AND LOADS TO BE SUPPLIED AND INSTALLED BY PACKAGE CH0031.
11. TYPICAL ALL CABLE TAGS ARE PREFIXED WITH 3290-.

LEGEND

- (27) UNDER VOLTAGE RELAY
- MAGNETIC CONTACTOR. 42

- X2 PT TEST TERMINAL BLOCK
- E – ELECTRICAL INTERLOCK
- FO/CO – FIBRE/CO OPTIC TRANSCEIVER.

CRITERIA FOR AUTO TRANSFER

1. TWO INCOMERS SHALL NOT BE PARALLELED AT ANY TIME.
2. CB1,CB2 AND CB3 ARE NORMALLY CLOSED.
3. CB4 IS NORMALLY OPEN.
4. WHEN CB1 INCOMER SUPPLY FAILS, AFTER SOME DELAY, AUTO TRANSFER SHALL OPEN CB1 BREAKER FIRST THEN CLOSE CB4 BREAKER TO KEEP BUS ENERGIZED IF CB4 INCOMING SUPPLY IS AVAILABLE.
5. PROTECTION TRIP OF RESPECTIVE BREAKER (ANY INCOMER) SHOULD BLOCK THE AUTO TRANSFER.
6. AUTO TRANSFER SHALL BE BLOCKED WHEN AUTO/MANUAL SELECTOR SWITCH (AUTO TRANSFER) MOUNTED ON SWG IS IN MANUAL MODE.
7. AUTO TRANSFER SHALL BE BLOCKED WHEN REMOTE/LOCAL SELECTOR SWITCH MOUNTED ON SWITCHGEAR (FOR INCOMER) IS IN LOCAL MODE.
8. AUTO TRANSFER SHALL BE COORDINATED WITH UPSTREAM AUTO TRANSFER.
9. AUTO TRANSFER SHALL AUTOMATICALLY RETURN TO CB1 UPON RETURN OF VOLTAGE OF CB1 FEEDER.

EQUIPMENT LAYOUT

T	DISTRIBUTION TRANSFORMER
J / F J	DISCONNECT SWITCH, UNFUSED DISCONNECT SWITCH, FUSED C1
J	COMBINATION MAGNETIC MOTOR STARTER AND DISCONNECT
	MANUAL MOTOR STARTER
M	D.C. MOTOR
M HP	A.C. MOTOR (HORSEPOWER AS INDICATED)
MS	SYNCHRONOUS MOTOR
HTR	CONVECTION HEATER
	HEATING ELEMENT
UH	UNIT HEATER
C1	RADIANT HEATER
	600 V POWER OUTLET
	DISTRIBUTION PANEL
T	DISTRIBUTION PANEL WITH DISTRIBUTION TRANSFORMER WALL MOUNTED ABOVE
	CONTROL PANEL, JUNCTION BOX OR AS IDENTIFIED
DG	EMERGENCY POWER GENERATOR (DIESEL GENERATOR SET)
	PUSHBUTTON STATION
T	THERMOSTAT
	VARIABLE FREQUENCY DRIVE (VFD)

LIGHTING

H1	LIGHTING FIXTURE, CEILING MOUNTED OR SUSPENDED H1 DENOTES FIXTURE TYPE (SEE NOTE 1)
W1	LIGHTING FIXTURE, WALL MOUNTED W1 DENOTES FIXTURE TYPE (SEE NOTE 1)
P1	LIGHTING FIXTURE, POLE MOUNTED P1 DENOTES FIXTURE TYPE (SEE NOTE 1)
F1	FLUORESCENT LIGHTING FIXTURE CEILING MOUNTED OR SUSPENDED, DIAGONAL SLASH INDICATES CONNECTION TO ESSENTIAL POWER. F1 DENOTES FIXTURE TYPE (SEE NOTE 1)
F2	FLUORESCENT LIGHTING FIXTURE WALL MOUNTED. F2 DENOTES FIXTURE TYPE (SEE NOTE 1)
X3	EXIT SIGN, CEILING MOUNTED (NOTES 1, 2) X3 DENOTES FIXTURE TYPE (SEE NOTE 1)
X2	EXIT SIGN, WALL MOUNTED (NOTES 1, 2) X2 DENOTES FIXTURE TYPE (SEE NOTE 1)
E	LIGHTING FIXTURE CEILING MOUNTED OR SUSPENDED FED BY AN EMERGENCY CIRCUIT
E	LIGHTING FIXTURE WALL MOUNTED FED BY AN EMERGENCY CIRCUIT
$a	LIGHT SWITCH SINGLE POLE, WALL MOUNTED a = SWITCH IDENTIFICATION
$3	3 WAY LIGHT SWITCH
$P	LIGHT SWITCH C/W PILOT LIGHT
$PD	LIGHT SWITCH WITH PRESENCE DETECTOR (ON–AUTO–OFF)
PD	CEILING MOUNTED PRESENCE DETECTOR FOR LIGHT SWITCHING
PEC	PHOTO–ELECTRIC CELL

RECEPTACLES

	SINGLE RECEPTACLE 120 V, 15 A
	DUPLEX RECEPTACLE 120 V, 15 A WP = WEATHERPROOF COVER GFI = GROUND FAULT INTERUPTER TL = TWIST LOCK
20A	DUPLEX RECEPTACLE 120 V, 20 A
20A	SINGLE RECEPTACLE 240 V, 20 A

LIGHTING (CONT'D)

C	CONTACTOR
	SELECTOR

GROUNDING

	T CONNECTION
	X CONNECTION
	GROUND CONDUCTOR 1 m LONG COILED UP FOR FUTURE CONNECTION
	EMBEDDED GROUND PLATE
	500 kcmil GROUND CONDUCTOR
	4/0 AWG GROUND CONDUCTOR
	2/0 AWG GROUND CONDUCTOR
UP	GROUND CONDUCTOR GOING UP
DN	GROUND CONDUCTOR GOING DOWN
UP/DN	GROUND CONDUCTOR GOING UP AND DOWN
	GROUND ROD
	GROUND TEST LINK

SWITCHYARD LAYOUT

M	MOTOR OPERATED DISCONNECT SWITCH MECHANISM
	MANUALLY OPERATED DISCONNECT SWITCH
	JUNCTION BOX
	CT AND CVT'S 3ø JUNCTION BOX
CD	COUPLING DEVICE BOX (LINE TUNING EQUIPMENT)
	CABLE TRENCH WITH ONE SEPARATOR
	LOW VOLTAGE BURIED DISTR. AND CONTROL CABLE
	BURIED ELECTRICAL DUCT CONTAINING CABLES FOR REVENUE METERING CT & CVT's

FIRE DETECTION SYSTEM

FP	FIRE ALARM PANEL
	ANNUNCIATOR PANEL
DCP	DELUGE CONTROL PANEL
FMC	FIRE MONITORING CABINET
FP E	FIRE PUMP E = ELECTRICAL P = PROPANE D = DIESEL
F PS A	ADDRESSABLE MANUAL PULLSTATION A = ABORT STATION (YELLOW) I = INITIATE STATION (BLUE)
	SUPERVISORY TAMPER SWITCH
	LOW PRESSURE SWITCH
F	MAGNETIC HOLD OPEN DEVICE F = FLOOR MOUNT W = WALL MOUNT
I	IONIZATION SMOKE DETECTOR
O	OPTICAL SMOKE DETECTOR
HD	HEAT DETECTOR
F wp	FIRE ALARM HORN wp = WEATHERPROOF
F	FIRE ALARM BELL
F	FIRE ALARM STROBE LIGHT
F	FIRE ALARM HORN/STROBE COMBINATION
F T or R	BEAM DETECTOR T = TRANSMIT R = RECEIVE
R	BEAM SMOKE DETECTOR REFLECTOR
E.O.L.	END OF LINE RESISTOR
DM	DUAL MONITORING MODULE
MM	MONITORING MODULE

FIRE DETECTION SYSTEM (CONT'D)

	CONTROL RELAY MODULE
FSH	HIGH FLOW SWITCH
ZSL	LIMIT SWITCH

TELECOMMUNICATION SYSTEM

	TELEPHONE OUTLET
W	TELEPHONE OUTLET WALL–MOUNTED
T	TELEPHONE OUTLET TABLE TOP
E	TELEPHONE OUTLET EXTERIOR
	DATA OUTLET
W	DATA OUTLET WALL–MOUNTED
	PUSH BUTTON
W	TELEPHONE OUTLET WALL–MOUNTED AND RINGING HORN
E W	TELEPHONE OUTLET EXTERIOR WALL–MOUNTED AND RINGING HORN
	TELEPHONE ACOUSTICAL CABINET (SYMBOL IS DRAWN TO SCALE ON LAYOUTS)
	TELEPHONE ACOUSTICAL BOOTH (SYMBOL IS DRAWN TO SCALE ON LAYOUTS)
	TELECOM OUTLET (TELEPHONE / DATA)
J	CONTROL/TELECOMMUNICATION JUNCTION BOX

CABLE TRAYS

	CABLE TRAY
	CABLE TRAY ELEVATION CHANGE (ARROW INDICATES UPPER LEVEL)
	CABLE TRAY SECTION
	CABLE TRAY SECTION WITH BARRIER STRIP

INTRUSION & BURGLAR ALARM SYSTEM

M T	INTRUSION ALARM CONTROL PANEL
M T	CARD ACCESS READER
M T	MOTION DETECTOR
M T	CAMERA
K	SECURITY SYSTEM KEYPAD ENTRY STATION.
DS	ELECTROMAGNETIC DOOR STRIKE WITH MONITORING CONTACT
DM	MAGNETIC DOOR SWITCH
KB	SECURITY SYSTEM MAGNETIC LOCK KEY BYPASS SWITCH
	ALARM BELL
	WALL HORN
M T	INTERCOM
M T	AUDIO DEVICE
	CONTROL TRANSFORMER (VOLTAGE AS INDICATED)

CONDUITS

	EMBEDDED CONDUIT
	SURFACE CONDUIT
UP	CONDUIT GOING UP
DN	CONDUIT GOING DOWN

NOTE

1. SEE DRAWING MFA–SN–CD–3340–EL–DD–0020–01 FOR LIGHTING FIXTURE TYPES.
2. THE ARROW INDICATES DIRECTION FROM WHICH THE EXIT IS READ, ADD ARROWS FOR ADDITIONAL DIRECTIONS.

DETAIL 3
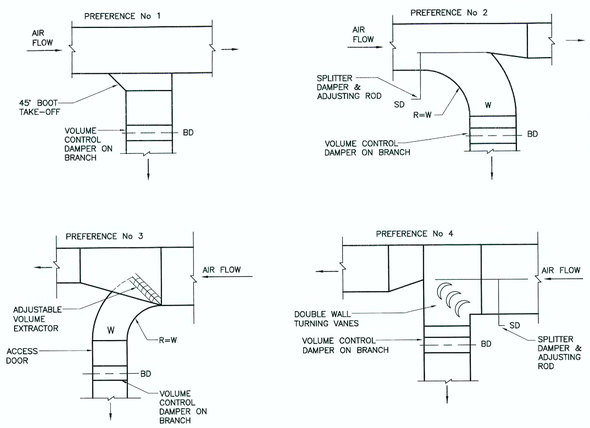
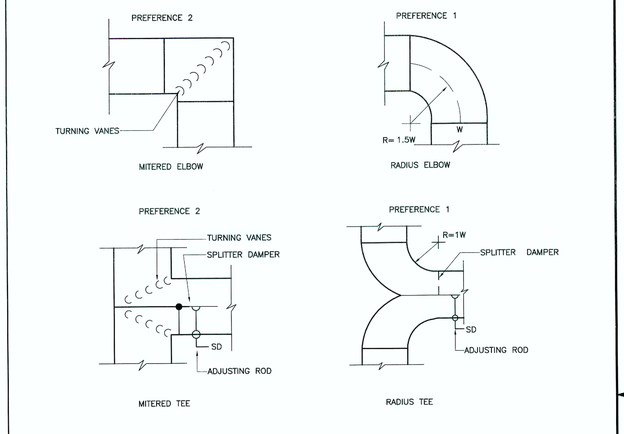
VSG AND VSE HVAC SYSTEM SCHEMATIC
NTS



DETAIL 2
TYPICAL TAKE-OFFS FOR LOW VELOCITY SUPPLY DUCTS
NTS



DETAIL 1
STANDARD DUCT FITTINGS
NTS

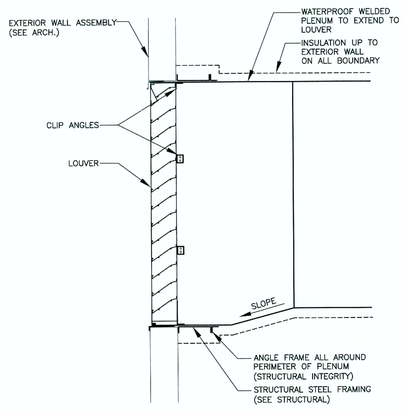
NOTES:

1. ALL CUTTING OF WALL, STRUCTURAL SUPPORTS, SEALING OF WALL OPENING AND NECCESARY SILLS, MOULDINGS AND FLASHING SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR.

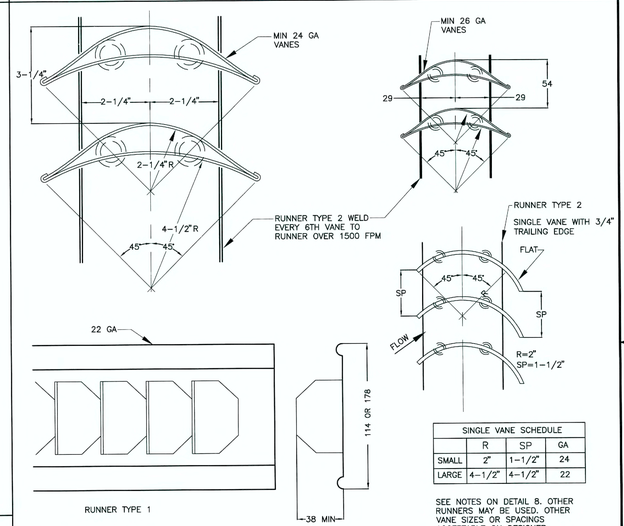
2. ALL INTAKE AND EXHAUST DUCTWORK 1.5 m BACK FROM LOUVER SHALL BE ALL WELDED WATERTIGHT CONSTRUCTION.

3. SUPPLY AND INSTALLATION OF LOUVER INTO FRAMED WALL OPENING SHALL BE THE RESPONSIBILITY OF THE MECHANICAL SUBCONTRACTOR.

4. EXACT OPENING SIZES REQUIRED TO ACCOMMODATE LOUVER SIZES SHALL BE FORWARDED TO THE CONTRACTOR BY THE MECHANICAL SUBCONTRACTOR.



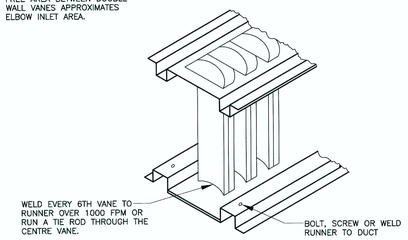
DETAIL 5
WALL LOUVER PLENUM AND DUCT CONNECTION DETAIL
NTS



SINGLE VANE SCHEDULE			
	R	SP	GA
SMALL	2"	1-1/2"	24
LARGE	4-1/2"	4-1/2"	22

SEE NOTES ON DETAIL 8. OTHER RUNNERS MAY BE USED. OTHER VANE SIZES OR SPACINGS ACCEPTABLE ON DESIGNER APPROVAL.

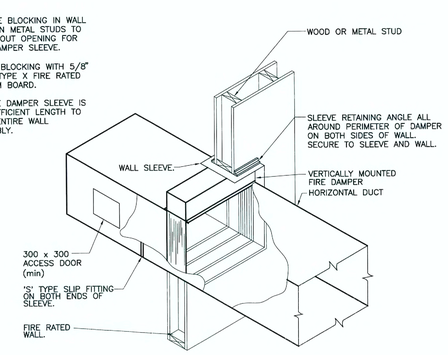
FREE AREA BETWEEN DOUBLE WALL VANES APPROXIMATES ELBOW INLET AREA.



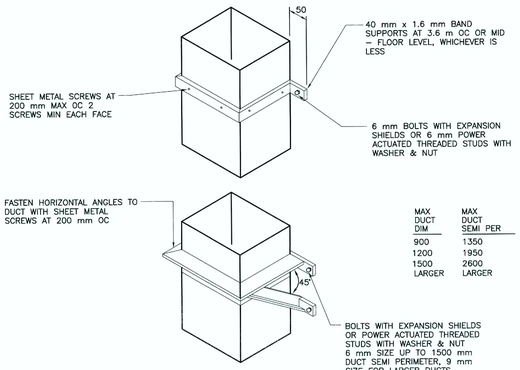
DETAIL 4
VANES AND VANE RUNNERS DETAIL
NTS

NOTES:

1. PROVIDE BLOCKING IN WALL BETWEEN METAL STUDS TO FRAME OUT OPENING FOR FIRE DAMPER SLEEVE.
2. COVER BLOCKING WITH 5/8" THICK TYPE X FIRE RATED GYPSUM BOARD.
3. ENSURE DAMPER SLEEVE IS OF SUFFICIENT LENGTH TO SPAN ENTIRE WALL ASSEMBLY.

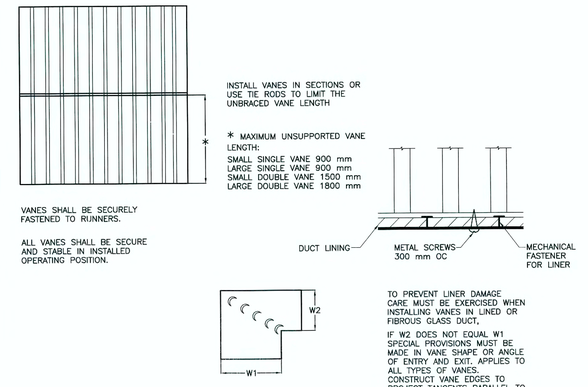


DETAIL 8
STUD WALL MOUNTED RECTANGULAR DUCT FIRE DAMPER DETAIL
NTS



MAX DUCT DIM	MAX DUCT SEMI PER	MIN ANGLE SIZE
900	1350	25x25x3
1200	1950	32x32x3
1500	2800	40x40x3
LARGER	LARGER	50x50x3

DETAIL 7
SUPPORTS FOR VERTICAL DUCTS
NTS



DETAIL 6
VANE SUPPORT DETAILS IN ELBOWS

GENERAL NOTES:

1. GENERAL:

1.1 THE MECHANICAL AND ELECTRICAL EQUIPMENT SHOWN ON THE CIVIL/STRUCTURAL/ARCHITECTURAL DRAWINGS ARE FOR INFORMATION ONLY AND ARE NOT EXHAUSTIVE. THE MECHANICAL AND ELECTRICAL DRAWINGS SHALL BE READ CONJOINTLY WITH THE CIVIL/STRUCTURAL/ARCHITECTURAL DRAWINGS.

1.2 ALL DIMENSIONS ARE IN MILLIMETRES, COORDINATES AND ELEVATIONS ARE IN METRES, UNO.

1.3 DIMENSIONS SHALL NOT BE SCALED FROM THE DRAWINGS.

1.4 THESE GENERAL NOTES SHALL BE READ CONJOINTLY WITH THE SPECIFICATION.

2. CONCRETE:

2.1 THE CEMENT TYPE SHALL BE AS PER SPECIFICATION.

2.2 MIX DESIGN FOR CONCRETE CLASSES AS INDICATED ON THE CONCRETE DRAWINGS SHALL BE AS PER SPECIFICATION.

2.3 ALL EXPOSED CONCRETE EDGES FOR COLUMNS, BEAMS, TOP OF WALLS, OPENINGS, ETC. SHALL HAVE A 25 mm CHAMFER UNO.

2.4 ALL CONSTRUCTION JOINTS SHALL BE ROUGHENED TO EXPOSE THE AGGREGATES TO A FULL AMPLITUDE OF AT LEAST 5 mm UNO.

2.5 ALL PRIMARY CONCRETE SURFACES IN CONTACT WITH SECOND STAGE CONCRETE FOR GUIDES AND LINTELS OF TRASHRACKS, BULKHEAD GATES, HEAD GATE AND DRAFT TUBE GATES IN THE POWERHOUSE AS WELL AS FOR GUIDES OF STOPLOGS AND HEAD GATE IN THE SPILLWAY SHALL BE ROUGHENED TO EXPOSE THE AGGREGATES TO A FULL AMPLITUDE OF AT LEAST 5 mm.

2.6 SEE SPECIFICATION FOR CONTRACTION JOINT TREATMENT.

2.7 CONCRETE FLOOR HARDENER SHALL BE USED ON THE ELECTRICAL BUILDING FLOOR. REFER TO THE SPECIFICATION, UNO.

3. REINFORCEMENT:

3.1 ALL REINFORCEMENT (REINFORCING STEEL) SHALL BE GRADE 400R, UNO OR 400W WHERE WELDING OF BARS IS INDICATED.

3.2 DEVELOPMENT AND LAP SPLICE LENGTHS SHALL BE AS INDICATED IN TABLES 1 THROUGH 3, UNO.
THE "TOP BARS" CATEGORY INCLUDES HORIZONTAL REINFORCEMENT PLACED IN SUCH A WAY THAT MORE THAN 300 mm OF FRESH CONCRETE IS CAST IN THE MEMBER BELOW THE DEVELOPMENT LENGTH OR SPLICE. THE "TOP BARS" CATEGORY DOES NOT APPLY TO THE HORIZONTAL REINFORCEMENT OF WALLS, UNO.
THE "OTHER BARS" CATEGORY INCLUDES REINFORCEMENT THAT DOES NOT ENTER INTO THE "TOP BARS" CATEGORY.

TABLE 1: Fy = 400 MPa f'c = 25 MPa

	TOP BARS		OTHER BARS	
BAR SIZE	DEVELOPMENT LENGTH (mm)	LAP SPLICE LENGTH (CLASS B) (mm)	DEVELOPMENT LENGTH (mm)	LAP SPLICE LENGTH (CLASS B) (mm)
10M	380	490	300	380
15M	570	740	440	570
20M	750	980	580	750
25M	1170	1530	900	1170
30M	1410	1830	1080	1410
35M	1640	2130	1260	1640

TABLE 2: Fy = 400 MPa f'c = 30 MPa

	TOP BARS		OTHER BARS	
BAR SIZE	DEVELOPMENT LENGTH (mm)	LAP SPLICE LENGTH (CLASS B) (mm)	DEVELOPMENT LENGTH (mm)	LAP SPLICE LENGTH (CLASS B) (mm)
10M	350	450	300	350
15M	520	670	400	520
20M	690	890	530	690
25M	1070	1390	830	1070
30M	1290	1670	990	1290
35M	1500	1950	1160	1500

TABLE 3: Fy = 400 MPa f'c = 35 MPa

	TOP BARS		OTHER BARS	
BAR SIZE	DEVELOPMENT LENGTH (mm)	LAP SPLICE LENGTH (CLASS B) (mm)	DEVELOPMENT LENGTH (mm)	LAP SPLICE LENGTH (CLASS B) (mm)
10M	320	420	300	320
15M	480	620	370	480
20M	640	830	490	640
25M	990	1290	770	990
30M	1190	1550	920	1190
35M	1390	1800	1070	1390

4. FORMWORK:

4.1 CONCRETE COVER IS MEASURED FROM THE CONCRETE SURFACE TO THE NEAREST SURFACE OF REINFORCEMENT, (INCLUDING TRANSVERSE REINFORCEMENT HOOKED AROUND LONGITUDINAL BARS.)

ELEMENT	COVER BARS
CONCRETE PLACED AGAINST ROCK	75 mm
EXTERIOR EXPOSED FACES OF WALLS	75 mm
INTERIOR BEAMS AND SLABS	40 mm
EXTERIOR BEAMS AND SLABS	50 mm
INTERIOR EXPOSED FACES OF WALLS AND COLUMNS	50 mm
EXTERIOR FACES COVERED BY BACKFILL, ROCK FILL	75 mm
FACES IN THE HYDRAULIC PASSAGE	100 mm

4.2 CONCRETE FINISHES FOR THE FORMED AND UNFORMED SURFACES AS INDICATED ON THE CONCRETE DRAWINGS SHALL BE AS PER SPECIFICATION.

4.3 TIE ROD HOLES:

FOR VISIBLE WALL SURFACES, TIE ROD HOLES SHALL BE ALIGNED VERTICALLY AND HORIZONTALLY AND LATER SHALL BE FILLED WITH GROUT.

5. WATERSTOPS:

5.1 PVC WATERSTOP TYPES WSA AND WSB, AS DEFINED IN THE WATERSTOPS SPECIFICATION, SHALL BE USED AS FOLLOWS:
WSA : FOR CONSTRUCTION JOINTS
WSB : FOR CONTRACTION JOINTS

6. STRUCTURAL STEEL:

6.1 ALL STRUCTURAL STEEL WORKS INCLUDING MATERIAL, SHOP DRAWINGS, FABRICATION AND ERECTION SHALL COMPLY WITH THE SPECIFICATION: MFA-SN-CD-2000-MC-TS-0001-01 STRUCTURAL STEEL 05 12 00.

6.2 STRUCTURAL STEEL MEMBERS SHALL BE SHOP ASSEMBLED TO THE MAXIMUM DIMENSIONS THAT TRANSPORTATION AND HANDLING WILL ALLOW FOR DELIVERY TO THE SITE.

6.3 CONTRACTOR SHALL BE RESPONSIBLE FOR THE DESIGN OF ALL CONNECTIONS. THE DESIGN OF THE CONNECTIONS SHALL BE SUBMITTED TO THE ENGINEER FOR REVIEW AND APPROVAL, BEFORE THE COMMENCEMENT OF FABRICATION.

6.4 STEEL ASSEMBLIES FABRICATED IN THE SHOP SHALL BE WELDED.

6.5 ALL BUTT-WELDING OF ROLLED SHAPES OR OF WELDED PLATE SHAPES, IN A STRUCTURAL MEMBER, SHALL BE COMPLETE JOINT PENETRATION (FULL STRENGTH) VERIFIED 100%. AFTER THE BUTT-WELDING THE SURFACES SHALL BE GROUND SMOOTH.

6.6 CONNECTIONS DONE ON SITE SHALL BE BOLTED, UNLESS NOTED OTHERWISE ON DRAWINGS.

6.7 THE BOLTED CONNECTIONS SHALL BE BEARING TYPE, UNLESS NOTED OTHERWISE ON DRAWINGS. THE BOLT LENGTHS SHALL BE AS REQUIRED AND THEN INSTALLED IN ORDER TO HAVE THE THREADS EXCLUDED FROM THE SHEAR PLANE. FOR THE DESIGN OF THESE CONNECTIONS, SEE THE TECHNICAL SPECIFICATION FOR STRUCTURAL STEEL.

6.8 UNLESS NOTED OTHERWISE ON DRAWINGS, THE BOLTED CONNECTIONS FOR THE VERTICAL BRACINGS, SHALL BE SLIP-CRITICAL CONNECTION TYPE. THESE BOLTED CONNECTIONS SHALL HAVE THE PARTS PAINTED IN ORDER TO OBTAIN CLASS A CONTACT FOR SURFACES. THE BOLT LENGTHS SHALL BE AS REQUIRED AND THEN INSTALLED IN ORDER TO HAVE THE THREADS EXCLUDED FROM THE SHEAR PLANE.

6.9 BOLTS SHALL BE ASTM A325. THE BOLTS SHALL BE BLACK, EXCEPT FOR THE CONNECTIONS OF THE GALVANIZED STEELS WHERE THE BOLTS SHALL BE GALVANIZED UNO.

6.10 STRUTS AND TIES SHALL BE CONNECTED FOR A MINIMUM TENSILE FORCE OF 100 kN.

6.11 HOLLOW SECTIONS SHALL HAVE BOTH ENDS SEALED WITH 6 mm CAP PLATES. AT THE LOWEST POINT OF THE HOLLOW MEMBER, A 12 mm ø HOLE SHALL BE PROVIDED FOR AERATION AND DRAINAGE.

6.12 DECK FOR THE ROOFS SHALL BE GALVANIZED AS MENTIONED IN THE SPECIFICATION. THE CONTRACTOR SHALL VERIFY THE CONNECTIONS OF THE ROOF DECKS TO WITHSTAND EXTERIOR WIND SUCTION PLUS INTERNAL PRESSURE, BASED ON GEOGRAPHICAL LOCATION DATA IN THE CANADIAN NATIONAL BUILDING CODE.

6.13 GRATINGS SHALL BE TYPE 24-102 WITH BEARING BARS OF 32x4.8 BY FISHER AND LUDLOW OR APPROVED EQUIVALENT BY THE ENGINEER, UNLESS NOTED OTHERWISE ON THE DRAWINGS. THE STAIR TREADS SHALL BE IN GRATING WITH NOSING IN BENT CHECKERED PLATE TYPE 308x914 UNO, BY FISHER AND LUDLOW OR APPROVED EQUIVALENT BY THE ENGINEER.

6.14 EXTERIOR GRATINGS AND TREADS SHALL BE SERRATED.

6.15 STAIR TREADS AND LANDINGS, THE GUARD RAILS AND ALL THEIR CONNECTIONS SHALL WITHSTAND THE LOADINGS AS PER THE CANADIAN NATIONAL BUILDING CODE.

6.16 THE CONTRACTOR SHALL DO THE NECESSARY TOUCH UP OF ANY DAMAGED PAINT OR DAMAGED GALVANIZING OF THE BOLT HEADS AND NUTS AFTER THE FINAL TORQUE. CONNECTION SURFACES SHALL BE TOUCHED UP AS MENTIONED IN THE SPECIFICATION.

6.17 UNDERSIDE OF THE COLUMN BASE PLATES SHALL ONLY BE PAINTED WITH PRIMER, EXCEPT FOR A 25mm STRIP ON THE UNDERSIDE PERIMETER, WHICH SHALL RECEIVE NORMAL PAINT.

6.18 FOR THE STEEL ITEMS WHICH ARE REQUIRED TO BE GALVANIZED, ALL CONNECTED MATERIALS SHALL HAVE A MINIMUM CONTINUOUS SEAL WELD COMBINED WITH THE WELDING WHERE CAPACITY IS REQUIRED.

6.19 HILTI TYPE BOLTS INCLUDING THE NUTS AND WASHERS SHALL BE HOT DIP GALVANIZED AS PER THE DATA SHEET OF THE MANUFACTURER, OR IN STAINLESS STEEL AS REQUESTED ON THE DRAWINGS.

6.20 THE FOLLOWING STEEL ITEMS SHALL BE HOT DIP GALVANIZED:
- STAIRS
- LADDERS
- GRATINGS
- GUARD RAILS
- COVERS AND FRAMES
- SUPPORTING STEEL FIXED ON CONCRETE FOR GRATINGS.
- HIGH STRENGTH BOLTS ASTM A325 FOR CONNECTION OF GALVANIZED STEEL ONLY.
- ANCHOR BOLTS, NUTS, AND WASHERS
- ANCHOR BOLTS FOR GUARDRAILS AND RAILS, INCLUDING THEIR WASHERS AND NUTS. THE COATING FOR ANCHOR BOLTS SHALL ONLY BE THE PROJECTED LENGTH PLUS 60mm MIN
- EMBEDDED STEEL, UNLESS NOTED OTHERWISE.

IN ORDER TO AVOID DISTORTIONS OF SLENDER STEEL MEMBERS, THE CONTRACTOR MAY CHOOSE A DIFFERENT EQUIVALENT ZINC PROTECTION METHOD.

6.21 COLUMNS SHALL BE FIRST INSTALLED ON STEEL SHIM PACKS IN NUMBERS AS REQUIRED, FOR LEVELING OF THE BASE PLATES IT IS FORBIDDEN TO USE NUTS IN LIEU OF SHIM PACKS UNDER THE BASE PLATES.

6.22 GROUTING AT THE UNDERSIDE OF COLUMN BASE PLATES SHALL BE DONE WITH A RECOGNIZED NON-METALLIC NON-SHRINK CEMENT GROUT, AS PER THE SPECIFICATION.

6.23 ANCHOR BOLTS SHALL BE BY PORTLAND BOLT MANUFACTURING COMPANY OR APPROVED EQUIVALENT BY THE ENGINEER. THE STEEL GRADES SHALL BE AS INDICATED ON DRAWINGS.

6.24 ANCHOR BOLT LOCATIONS AND PROJECTIONS SHALL BE VERIFIED BY THE CONTRACTOR. THE ENGINEER SHALL BE INFORMED ABOUT ALL DISCREPANCIES.

6.25 FORCES: ALL FORCES AND MOMENTS GIVEN ON DRAWINGS ARE FACTORED AND EXPRESSED IN kN AND kNm.

6.26 THE CONNECTIONS SHALL BE DESIGNED USING THE FORCES GIVEN ON DRAWINGS AND FOLLOWING THE REQUIREMENT IN THE TECHNICAL SPECIFICATION.

6.27 THE SLIP-CRITICAL CONNECTION TYPE SHALL BE DESIGNED USING 80% OF THE FACTORED FORCES MENTIONED ON THE DRAWINGS AND THE BOLTS SHALL BE SLIP RESISTANCE FOLLOWING CSA S16-09, CLAUSE 13.12, SEE THE TABLE 3-11 IN THE CISC HANDBOOK OF STEEL CONSTRUCTION.

6.28 THE STRUCTURAL STEEL DIMENSIONS SHOWN ON DRAWINGS ARE AT 23° C. THE CONTRACTOR SHALL APPLY CORRECTIONS FOR THE DIMENSIONS DEPENDING ON THE ACTUAL TEMPERATURES AT THE TIME OF FABRICATION.

ABBREVIATIONS:

NOTES:

1. FOR GENERAL NOTES, LEGEND, AND ABBREVIATIONS SEE DWG MFA-SN-CD-2400-EN-LS-0001-01 (505573-3241-40DD-0001).
2. ALL MECHANICAL AND ELECTRICAL PENETRATIONS SHOWN ARE APPROXIMATE. COORDINATE ALL PENETRATIONS WITH MECHANICAL AND ELECTRICAL SUPPLIER DRAWINGS.
3. FOR MECHANICAL EQUIPMENT PENETRATIONS REFER TO DWG MFA-SN-CD-2440-ME-PL-0001-01 (505573-3242-45DD-0011).
4. FOR ELECTRICAL EQUIPMENT PENETRATIONS REFER TO DWG MFA-SN-CD-2440-EL-LT-0002-01 (505573-3243-47DD-0121).
5. FLOOR CONTRACTION JOINTS TO BE SAW CUT OR MADE USING ZIP-STRIPS AS PER SPECIFICATION.
6. CONCRETE SLAB TO CONTAIN STEEL FIBRE REINFORCEMENT, DRAMIX RC-65/60-BN 20Kg/m³ OR ACCEPTABLE ALTERNATE. ALL WORK SHALL BE DONE IN ACCORDANCE WITH THE MANUFACTURER'S WRITTEN RECOMMENDATIONS.
7. HOLD FLOOR SLAB PENDING CONFIRMATION OF GENERATOR SUPPORT.
8. CONCRETE FOR FLOOR SLAB SHALL BE TYPE BC-3-A BUT SHALL NOT BE AIR ENTRAINED.
9. CONCRETE FLOOR FINISH SHALL BE U3 WITH SURFACE HARDENER.

EXHIBIT 2

COMPENSATION

1 GENERAL

1.1 Company shall compensate Contractor for the Work, in accordance with the provisions of this Agreement. Subject to any additional compensation pursuant to a Change Order, only those lump sum amounts, unit rates and prices specifically identified in this Exhibit 2 shall be paid by Company to Contractor for the Work and costs not identified are deemed to be included in the lump sum amounts, unit rates and prices for the Work. Company does not guarantee a minimum or a maximum amount of Work.

1.2 All lump sum amounts, rates and prices stated in this Exhibit 2 shall be all-inclusive to meet all requirements outlined in this Agreement.

1.3 No payment in excess of the agreed Contract Price will be made without a formal Change Order to the Agreement. The actual final agreed costs for all Work will be drawn down against the agreed Contract Price and Contractor shall be responsible for monitoring its actual costs against the Contract Price on a weekly basis.

1.4 Invoices shall be issued by Contractor in accordance with Article 12 of the Agreement, Exhibit 2 – Compensation, Exhibit 3 – Coordination Procedures and Exhibit 13 – Provincial Benefits.

2 FIXED LUMP SUM

2.1 The following provisions in this Section 2 apply only to Work completed on a lump sum basis.

2.2 All of the payment items stated in Appendix A – Schedule of Price Breakdown of this Agreement are fixed price and their aggregate total will form the fixed lump sum price of the Agreement.

2.3 Each item stated in Appendix A – Schedule of Price Breakdown shall include all elements necessary to achieve completion of the item, whether specifically identified, or whether inherent in the Work.

2.4 Pursuant to Article 12 of the Agreement, payment for each item shall be on a lump sum basis and shall be made progressively as the Contractor has satisfied the requirements of each payment item and in accordance with the Milestone Payment Schedule attached as Appendix B to this Exhibit 2

2.5 Before making its application for payment under the Agreement, the Contractor shall submit to the Engineer a schedule of values of the various parts of the Work and totalling the full amount of the fixed lump sum price. The schedule shall be used as a guideline for applications for payment.

2.6 Measurement of lump sum price items shall be undertaken on a monthly basis (or as required) by Contractor and Company. Progress achieved against each item from the schedule of values and/or milestone event and approved by Company shall form the basis of interim measurement and payment of each lump sum. Only Company approved lump sum progress payments shall be invoiced by Contractor.

3 UNIT PRICES

3.1 The following provisions in this Section 3 apply only to Work completed on a unit price basis.

3.2 Where applicable, full compensation for Unit Price Work shall be determined in accordance with the Unit Prices set forth in Appendix A – Schedule of Price Breakdown, or as otherwise agreed between Company and Contractor.

3.3 Any quantities of units estimated are not guaranteed, as independent circumstances shall control actual quantities performed and payment shall only be for actual quantities of Work installed and not any estimated quantities. There are no provisions in this Agreement for adjustment of the Unit Prices due to installed quantity variances (increases/decreases) from the estimated quantities.

3.4 Measurement of unit price items shall be undertaken on a monthly basis (or as required) by Contractor and Company. Such measurement shall form the basis of all progress and final payments for unit price Work. Only Company approved unit price measurement shall be invoiced by Contractor.

3.5 Unless otherwise specifically stated, all Unit Prices shall be complete and inclusive of all costs required for the Work.

4 OPTION PRICE FOR SECONDARY CONCRETE WORK

4.1 Notwithstanding references to secondary concrete work in Exhibit 1 – Scope of Work, the Parties have agreed to exclude the secondary concrete work from the Work on the basis set out in Sections 4.2 to 4.4 inclusive.

4.2 Company has the option, which may be exercised at its sole discretion, to add the secondary concrete work back into the Work for the fixed price of $20,000,000.00 Canadian dollars. This option remains available to Company until February 4, 2014 at which time this option shall expire.

4.3 If Company elects to exercise the option set out in Section 4.2:

(a) Company shall issue a Notice to Contractor on or before February 4, 2014 that it is exercising the option;

(b) within a reasonable time of such Notice, Company shall issue a Change Order consistent with the provisions of the Agreement; and

(c) the provisions of this Agreement, and Exhibit 1 – Scope of Work regarding secondary concrete work in particular, shall apply.

4.4 As an alternative to Section 4.2 above, the Parties may also negotiate an open book target cost model prior to February 4, 2014.

4.5 A concrete batch plant will be installed at the Muskrat Falls work site by one of Company's Other Contractors. Contractor can choose to obtain concrete supply from the Company's Other Contractor or is free to seek alternative suppliers. If the Contractor chooses to obtain concrete supply from Company's Other Contractor, the price shall be $350/m3 for supply only at batch plant. This price excludes costs for transport from the plant to the pour site for which Contractor will be responsible. If the actual price at the batch plant is higher than $350/m3, the Contract Price will be adjusted upward based on the difference between the actual price and $350/m3, times the actual quantity purchased by Contractor. These costs will be subject to verification by Company. If the actual price is lower than $350/m3, the Contract Price shall not be adjusted.

5 REIMBURSABLE WORK

5.1 The following provisions in this Section 4 apply only to Work completed on a reimbursable basis.

5.2 Where applicable, full compensation to Contractor for full and complete performance of any Work performed on a reimbursable basis shall be the sum of the following costs and mark-ups:

(a) Sum of Contractor's Labour Rates, detailed in Appendix D – Personnel Rate Schedule multiplied by approved hours of Work, detailed on timesheets approved by Company;

(b) Sum of Contractor's Equipment Rates, detailed in Appendix E – Equipment Rate Schedule multiplied by approved hours of use, detailed on timesheets approved by Company; and,

(c) Company approved material expenses, travel and mileage expenses, and third party expenses.

Contractor shall advise Company in writing when it has expended seventy-five percent (75%) of the total estimated price.

The Labour and Equipment Rates will not be adjusted for any reason whatsoever except as a result of the issuance of a Change Order by Company.

5.3 When Contractor is requested to purchase materials on a reimbursable basis:

(a) All actual costs to Contractor for materials supplied for incorporation into the permanent facility, excluding consumables, expendables, and small tools which cost Contractor less than $2,000.00 Canadian or as listed in Appendix D – Personnel Rate Schedule shall be at actual invoiced cost to Contractor (exclusive of tax), including transportation to Site, as substantiated by invoices certified paid or by such documentation as may be required by Company, plus a mark-up of 15%.

(b) Contractor shall solicit a minimum of three bids for material purchases of $30,000.00 Canadian and greater.

(c) Contractor shall supply a copy of supplier's invoice with each Invoice.

(d) Company reserves the right to provide, at no cost to Contractor, materials, equipment, services, supplies or incidentals required to perform the Work.

5.4 When Contractor is requested to supply equipment on a reimbursable basis:

(a) All costs of Contractor for Contractor-owned equipment shall be at the rates set forth in Appendix E – Equipment Rate Schedule.

(b) When Contractor's equipment does not resemble the equipment having rental rates listed in Appendix E – Equipment Rate Schedule the agreed rental rate shall be incorporated into the Agreement by Change Order prior to rental.

(c) All costs of Contractor for equipment which is rented from third parties and does not resemble the equipment having rental rates listed in Appendix E – Equipment Rate Schedule must be approved by Company in writing prior to rental and shall be at actual cost to Contractor, including transportation to Site, as substantiated by invoices certified paid or by such documentation as may be required by Company plus a mark-up of 15%

(d) For reimbursable Work, Company reserves the right to substitute and provide, at no cost to Contractor, equipment to perform the Work. Contractor shall not be allowed to claim for loss of profit and/or any other of its own costs resulting from such substitution by Company.

5.5 When Contractor requires third party services to assist with Work being performed on a reimbursable basis:

(a) Contractor shall secure Company pre-approval of any third party services, materials, tools, supplies and consumables that are required for the performance of the Work and are additional to that which is included in the rates and lump sum prices outlined herein. Company shall reimburse Contractor for the actual, documented and necessary costs of such materials, tools, supply, consumables, equipment and/or services.

(b) All third party services provided for performance of the Work which has been previously approved by Company shall be at actual cost to Contractor of such third party service provided by others plus a mark-up of 15%

(c) In no instance shall the third party rates plus mark-up exceed Contractor's rates for similar work or equipment.

(d) To be eligible for reimbursement, invoicing for third party services shall be fully supported by Billing Information and any other documentation that Engineer may reasonably require.

5.6 Travel, including travel time and mileage are included in the Contract Price.

The Company shall provide room and board for Contractor's planned workforce and staff on Site. In the event Contractor's actual workforce and staff on Site exceed plan and Company does not have space (available rooms) at the camp, then the Company shall pay Contractor compensation for room and board, and travel costs, as the case may be, per the applicable collective agreement for trades.

5.7 For all Work carried out on a reimbursable basis, Contractor shall prepare Time Sheets for all personnel, equipment, material and third party services assigned to the performance of the Work which will be approved and signed daily by the Engineer's Representative. Copies of time sheets shall accompany all Contractor invoices.

5.8 When Contractor uses assets of an associated company (i.e, common ownership, subsidiary, strategic partner, licensee, etc.) to undertake reimbursable Work then only one (1) mark-up shall be allowed on the actual associated company base cost for the Work.

6 OPERATIONAL SPARES

Appendix C of this Exhibit 2 details Contractor's recommended two (2) year operational spares and the associated unit prices. For the Term of the Agreement, Company may, at its sole discretion, purchase any number and any type of operational spares listed in

Appendix C – Operating Spares Price Schedule of this Exhibit 2, at the unit prices outlined therein.

The unit prices specified shall include all costs associated with design, manufacture, testing, preservation, storage, transport and delivery of the spares and all associated documentation. Spares shall be delivered to the Site in accordance with Incoterms 2010, Delivered Duty Paid (DDP). Supply shall be deemed to be complete upon delivery of the operational spares and all associated documentation.

Company will issue a Company Approved Change Order to Contractor covering all purchases of operating spares.

7 CHANGES

Whenever possible, Changes will be evaluated and agreed by the Parties on a lump sum basis. In the event that the Parties cannot agree on a lump sum price for a Change, Contractor will present Company with a cost estimate of the Change, based on the rates and prices in Appendices D and E. Where Changes are carried out on a reimbursable basis, Contractor shall ensure that it provides a copy of the associated Company Approved Change Order, along with all documentation necessary which clearly supports the charges submitted for payment and clearly demonstrates achievement of criteria, progress of the Change Work, or achievement of the Milestones contained therein, as the case may be.

Rates and prices outlined in Appendices D and E will apply only for increases in the Work. For decreases in the Work, the Parties will negotiate the cost of the scope reduction on a lump sum basis.

8 STANDBY TIME

When the Work is suspended by Company for a reason that is not related to the Contractor's performance of the Work, the Company shall compensate the Contractor for standby costs which are incurred by the Contractor. For all standby time approved by Company, Contractor shall prepare daily time sheets for all labour and equipment assigned to the performance of the Work, which will be reviewed, and if approved, signed by the Engineer's Representative. Copies of time sheets shall accompany all Contractor invoices. Rates outlined in Appendix E – Equipment Standby Rate Schedule shall apply when Contractor submits an invoice for payment of equipment standby costs. Payment for such standby will be limited to not more than eight hours in a twenty-four hour day or forty hours in a week.

No compensation will be allowed for equipment that is inoperable due to breakdown, unavailability, or the like. No payment will be allowed for equipment that is not operating because the work has been suspended by the Contractor for his own reasons.

9 MILESTONE PAYMENT SCHEDULE

Appendix B of this Exhibit 2 includes the Milestone Payment Schedule provided by Contractor. Company will pay the Milestone payments due to Contractor upon successful completion of Milestone which shall be accompanied by all relevant supporting documentation as Company or Engineer may require to verify completion of the progress.

10 PROJECT LABOUR AGREEMENT

A Project Labour Agreement (PLA) and Special Project Order (SPO) declaration are planned for the Site. Company recognizes that the PLA may affect rates provided in Appendix D – Personnel Rate Schedule. Company will adjust the rates up or down for the difference between the rates provided in Appendix D – Personnel Rate Schedule and the actual rates stated by the PLA, where applicable.

The Contractor shall be bound to the terms of the PLA, become a member of the Project Employers' Association and name at least one (1) staff person to be responsible for daily Labour Relations matters at the Site. Prior to working at Site, all Contractor's Personnel will be required to attend an LCP Site orientation session that includes health, safety and environment obligations; human resources policies, including respectful workplace, cultural sensitivity, gender equity and diversity; labour relations, including PLA overview, site standards, corrective action and dispute resolution.

Appendix F of this Exhibit 2 details the estimated trade person-hours which shall be an accurate estimate of the person-hours required by trade classification to complete the Scope of Work.

11 LIQUIDATED DAMAGES FOR DELAY AND PERFORMANCE INCENTIVES

11.1 Liquidated Damages

Contractor is responsible to achieve completion of all Milestones in accordance with the Milestone Schedule. For certain Milestones, as listed below, Company has made a reasonable and genuine pre-estimate of the damages that it would suffer (Liquidated Damages) if these particular Milestone dates are not achieved. If Contractor fails to achieve any of these Milestones by the associated Milestone dates listed in the Milestone Schedule, Contractor shall pay Company, as liquidated damages and not as a penalty, the amount listed for each and every calendar day by which the completion of such Milestone is delayed.

Milestone No.	Milestone	Liquidated Damages per calendar day of delay
M3a	Hydro-Mechanical primary embedded parts required for the Spillway slab delivered to Site	$5,000.00
M3b	Hydro-Mechanical primary embedded parts for the South Pier delivered to Site (figure 1)	$5,000.00
M3c	Hydro-Mechanical primary embedded parts for the Pier 1 delivered to Site	$5,000.00
M3d	Hydro-Mechanical primary embedded parts for the Pier 2 delivered to Site	$10,000.00
M3e	All remaining Hydro-Mechanical primary embedded parts required for all Piers as shown in figure 1 delivered to site. Includes Pier 3, Pier 4 and North Pier.	$10,000.00
M3f	All Hydro-Mechanical primary embedded parts required for downstream stoplogs delivered to site.	$10,000.00
M3g	All Rollway Hydro-Mechanical primary embedded parts delivered to site	$10,000.00
M4	Spillway all hydro-mechanical& electrical systems (including Trash Cleaner) commissioned and ready for river diversion	$25,000.00
M20a	Draft Tube Units 1& 2 Hydro-Mechanical, primary embedded parts, Delivered to Site	$10,000.00
M20b	Draft Tube Units 3 & 4 Hydro-Mechanical, primary embedded parts, Delivered to Site	$10,000.00
M21a	All Intake Unit 1 – Hydro-Mechanical primary embedded parts, delivered to Site	$5,000.00
M21b	All Intake Unit 2 – Hydro-Mechanical Primary embedded parts, delivered to Site	$10,000.00
M21c	All Intake Unit 3 – Hydro-Mechanical primary embedded parts, delivered to Site	$10,000.00
M21d	All Intake Unit 4 – Hydro-Mechanical Primary embedded parts, delivered to Site	$10,000.00
M23	All Intake hydro-mechanical work (including trash cleaner) commissioned and ready for reservoir impoundment	$25,000.00

The period of delay for such Milestone shall exclude each day of extension of time granted by Company in accordance with Articles 26, 31, 34 and 36 of the Agreement.

11.2 Performance Incentives

Company will pay the following performance incentives if Contractor achieves the performance goals listed.

Item No.	Performance Goal	Bonus
1	If Contractor achieves Milestone M4 by the associated Milestone date listed in the Interface and Milestone Schedule, Company will pay a bonus of :	$2,500,000.00
2	If Contractor achieves Milestone M23 by the associated Milestone date listed in the Interface and Milestone Schedule, Company will pay a bonus of:	$2,500,000.00
	TOTAL MAXIMUM PERFORMANCE INCENTIVE PAYMENTS	$5,000,000.00

12 CONTRACT PRICE

12.1 The Contract Price is, for most purposes of the Agreement, comprised of the two (2) lump sums in the amounts and currencies set out in Appendix A to this Exhibit. Except for the purposes described in Section 12.2 below, the Contract Price may be adjusted in accordance with the terms of the Agreement.

12.2 For the purposes of the Performance Security requirements in Article 7, a single currency Contract Price shall apply without change and shall be the amount calculated below, being the sum of the amounts in Appendix A converted to Canadian dollars using the exchange rate shown below.

Item	Amount	Currency	Exchange	$CDN Equivalent
A	$122,932,996	$ Can	1.0	$122,932,996
B	€60,880,279	$ Euro	1.347	$ 82,005,736
Contract Price				$204,938,732

12.3 For the purpose of limits of liability pursuant to Article 21.14 and Article 36.3, and insurance pursuant to Article 20.1(a), single lump sum Contract Price is required. That Contract Price shall be the greater of:

(a) the amounts referenced in Section 12.1, as may have been adjusted in accordance with the terms of the Agreement, converted to an equivalent $CDN value using the exchange rates listed in Section 12.2; or
(b) the Contract Price determined in Section 12.2.

In the event the Contract Price is adjusted by currency amounts not outlined in Section 12.2, those amounts shall be converted to a $CDN equivalent value using the applicable exchange rate published by the Bank of Canada on the Effective Date.

EXHIBIT 2 - APPENDIX A

SCHEDULE OF PRICE BREAKDOWN

LOWER CHURCHILL PROJECT MUSKRAT FALLS CH0032 SUPPLY AND INSTALL POWERHOUSE AND SPILLWAY HYDRO-MECHANICAL EQUIPMENT				SCHEDULE OF PRICE BREAKDOWN INTAKE, DRAFT TUBE & SPILLWAY (ALL INCLUSIVE SCOPE A&B)					PART 1 - APPENDIX A2.1 505573-CH0032-S1AF-I-2061 Rev. 00.0	
ISSUED FOR: CONTRACT DATE: NOV 15, 2013				CONTRACTOR'S NAME: ANDRITZ HYDRO CANADA INC.

EXHIBIT 2 - APPENDIX C

OPERATING SPARES PRICE SCHEDULE

ANDRITZ Hydro

1. Bidder will provide its recommended two (2) year operating spares along with pricing.

2. Bidder is required to provide itemized lists of all recommended spares and special tools and equipment. The lists should clearly define quantities, descriptions and unit prices for all line items.

3. The attached list "Spare Parts in Specifications" is to be used for reference purposes only and is not to be considered in any way as complete.

4. Bidder will include the following information:
   a) Expected usage rate of consumable spare parts.
   b) Sources of spare parts.
   c) Lead times required for delivery.
   d) Any discounts proposed for initial and subsequent spare parts orders.
   e) An indication of the size and mass of large items for shipping purposes.

The information included in this Appendix A2.3 will be used to form Appendix C – Operating Spares Price Schedule of Exhibit 2 – Compensation.

Andritz Answer

Andritz Hydro does not recommend any spare part other than the Capital spares already listed in the Technical Specifications and included in the Contract Price.

ANDRITZ Hydro

*All currency in CAD.

NOTES

Column 1: Trades and specialities required for the execution of the Work.
Column 2: Base rate is per the Project Labour Agreement.
Column 3: Vacation pay includes vacations, statutory holidays, sick and other leave with pay.
Column 4: Payroll allowances and burdens includes, but not limited to, unemployment insurance, workers' compensation, payroll tax, and other taxes and insurance measured by payroll, established employee benefits such as pension, health, and life insurance, bonus programs, fringe benefits, indemnity funds, training, and all other contributions or premiums as per the Project Labour Agreement or government regulations, as applicable.
Column 5: Small Tools includes all tools with a replacement value of less than two thousand ($2,000.00) Canadian Dollars. Refer to Attachment 1, Item 3 for a typical listing of these types of small tools. Such items shall be furnished by the Contractor complete with all accessories and expendable operating parts and shall be maintained in good condition including the replacement of parts as may be necessary.
Column 6: Consumables whether recoverable or non-recoverable (refer Attachment 1, Item 2) and Personal Protective Equipment (refer Attachment 1, Item 1).
Column 7: Overhead and Profit includes, but not limited to, all home/corporate office expenses, administration (Health and Safety Supervisors, Planners, Project Controls, Estimators, etc.) and supervision (Project Manager, Superintendent) costs.
Column 8: The Regular Time rate includes the total of columns 2 to 7.

Overtime rates (1.5x and 2.0x) include the regular time rate plus the overtime premium as per the Project Labour Agreement . Only the costs relative to those benefits and/or burdens that specifically apply when additional hours are worked shall be added. Other benefits, burdens and overhead will not be reimbursed since the full costs to the Contractor for these items has already been compensated in the regular time rate.

Second and Third Shift Premium is the incremental charge applied to the Regular Time Rate and Overtime Rates for second and third shift personnel.

ANDRITZ Hydro

ATTACHMENT 1

The following lists include, but are not limited to, items that Company classifies as "Personal Protective Equipment", "Consumables", and "Small Tools", whether recoverable or non-recoverable.

1. PERSONAL PROTECTIVE EQUIPMENT

All personal protective equipment shall meet the requirements of Occupational Health and Safety Regulations.

APRON, WELDERS
BELT, SAFETY
BLANKET, FIRE
BLOCK, WELDING HELMET
BOOT, SAFETY, ALL TYPES
BRACKET, FOR FACE SHIELD
BRACKET, FIBER BROW, SAFETY SHIELD
CAPS, PLASTIC SAFETY (FOR REBAR)
CURTAIN, WELDER
DUST MASK
DISPOSABLE MASK
EYESHIELD, FOR BENCH GRINDER
FIRST AID SUPPLIES
FLARE, ROAD, NON-ELECTRIC
GLASSES, SAFETY
GLOVES, WORK, ALL TYPES
GOGGLES, SAFETY
GUARDS, SHIN
GUARDS, TOE, METAL W/STRAP
HALF FACE or FULL FACE RESPIRATOR WITH CARTRIDGES – ALL TYPES
HARD HAT
HEARING PROTECTION
HOOD, WELDING
INSECTICIDE
LANYARD FOR SAFETY BELTS
LENS, WELDING
LIFE LINE
LOCKS
MOUNTING VISOR AND KWIK-KLIP
PULLER, FUSE SAFETY
RAIN WEAR, JACKET AND OVERALLS
SAFETY HARNESS
SIREN, ELECTRIC
STRAP, CHIN
SWEAT BANDS
TABLET, SALT
VISOR, SHIELD, CLEAR
WELDING SHIELDS

ANDRITZ Hydro

2. CONSUMABLES

ABRASIVES
ACID
ADAPTORS, TOOL – all types
ADHESIVE
ALCOHOL
ANTIFREEZE
ANTI-SPLATTER SPRAY
APRON, WELDERS
ARBORS, HOLE SAW
AUGER, HAND - post hole digger
BADGES
BAG, DUST – for belt sander
BAG, BOLT
BANDS, SAFETY HAT
BARRELS, WATER or TRASH
BATTERY – flashlight and lantern
BELTING, BELT DRESSING
BINS, TRASH
BITS – small hand tool, all types
BLADES – small hand tool, all types
BLANKET – wool, rubber
BOX, CARDBOARD
BRACKET, FLOAT HANDLE
BRICK, RUBBING
BROOM – all types
BRUSH – all types
BUCKET – all types
BULB – blow out, dust
BULB – flashlight, lantern, light
BURLAP
CABLES, RIGGING
CAN, OIL
CAN, SAFETY
CARBIDE
CARBORUNDUM – Blocks, Stones Walk
EXPANDER, TUBEROLLS AND MANDRELS
FASTENERS
FEELER STOCK
FILE, METAL CUTTING
FILE, WOOD CUTTING
FILTER – for vacuum cleaner
FILTERS
FISHTAPE, HAND
FITTINGS, ALEMITE & HOSE
FLAMBEAU, KEROSENE
FLASHLIGHT
FLINT
FLUID CLEANING
FLUX - brazing, welding
FORK, SEED
FORM TIES
FRAME, HACKSAW
FUELS (for construction equipment)
FUNNELS, ALL TYPES
FUSE (except for permanent plant use)
GARBAGE BAGS
GASKETS, HOSE
GLOVES, WORK, all types
GLUE
GLYCERINE
GOGGLES, WORK, all types
GRAPHITE
GREASE
GRIPS, PLASTIC for pliers
GROMMETS
GUIDE, HINGE-BUTT for router
GUN, CAULKING
GUN, GREASE
HASPS
PAD, POLISHING
PADLOCKS
PAINT (for erection marking)
PAINT STICK
PAN, DRAIN
PAPER – sand, toilet
PASTE – solder
PATTERNS
PENCIL, CARPENTER
PENS, WRITING, MARKING
PETROLEUM JELLY
PICK, CLAY
PLUG, PIPE TEST
PLUNGER, BATHROOM
POCKET, LINEMAN'S
POUCH, CANVAS
POUCH, ROD
POWDER, SCOURING
PULLER, WIRE
PUMICE
PUNCH AND CHISEL SETS
PUNCH, CONDUIT
PUNCH, PIN SET
PUTTY
RAGS
RAKE, GARDEN
RAKE, CONCRETE
RAKE, ROAD
REAMER, TAPER PIN (Hand Only)
RIGGING HOOKS
ROPE, MANILA
ROPE, POLYPROPYLENE
ROPE, WIRE
RULE - Extension, Wood, Fiberglass, Folding
WASHERS
WASHING POWDER
WASHROOM SUPPLIES
WASTE – Cotton
WATER CANS
WELD ROD
WELDING GASES
WHEEL, DEPRESSED CENTER
WHEELBARROW, All Types
WHEEL ABRASIVE
WHEEL, WIRE
WICKS, LANTERN
WIRE - tie & miscellaneous
WOOL – steel
WRAP AROUNDS

ANDRITZ Hydro

CHAIN, SAFETY
CHAIN, LOADBINDER
CHALK
CHALK LINE BOX
CHAMOIS
CHARCOAL AND COKE
CHISEL – all types
CHOKER – all types
CHUCKS, TOOL – all types
CLAMP, CABLE
CLAMP, HOSE
CLEANER, DRAIN
CLEANER, HAND
CLEANER, TIP
CLIPS, WIRE ROPE
CLOTH, DROP, PAINTER'S
CLOTH, EMERY
CLOTH, STRAINING
COAL and COKE
COMPOUND - cleaning, pipe, thread grinding
COMPOUND, SWEEPING
COMPOUND, WIRE PULLING
CONNECTORS – Cord, Cotter Pins
CORD, PLUMB BOB
CORD, SASH
CORK
CRAYON, LUMBER
CRAYON – Temperature Indicating
CREOSOTE
CUP – drinking
CUTTER WHEELS – tools, all types
DIE NUTS – Hexagon Rethread
DIES, BUTTON
DIES, KNOCKOUT
DIES, PIPE – for Hand Threaders Only
DIES, TMB – 8, Compression Tools
DIPPERS
HATCHET
HINGES
HOE
HOOK, SNAP
HOOK, TIMBER
HOSE, AIR, ¾" /Dia. Max. (Air Tools Only)
HOSE WATER to ¾"
HOSE, GREASE, GUN
HOSE, TWIN WELDING
ICE
INK, LAYOUT – for Millwrights
IRON, CAULKING
IRON, PACKING
IRON, YARNING
JAW, BOLT CUTTER REPLACEMENT
JITTERBUG – Concrete Hand
JOINT RUNNER
KEEL (lumber crayon)
KEY, CHUCK
KEY, EJECTOR for Roto Hammers
KEY, HEX
LASHING, WIRE ROPE
LATCHES
LATTERNS, 6 VOLT LENS - Welding
LIGHTER, SPARK
LIME, MARKING
LINE, FISH
LITHARGE
LUBRICANT – thread cutting, electric wire pulling
LUGS
MARKER, METAL
MARKER, PIPE CONTOUR
MENDERS, HOSE
MIRROR, INSPECTION
MOP
NAILS
RULE, TAPE
RUST PREVENTIVE
SANDBLAST NOZZLES
SCISSORS, ELECTRICIAN
SCRAPER, HAND
SCRAPER, SIDEWALK
SCRAPER, WALL
SCREEN CLOTH – Wire
SCREW RUNNER
SCREW STARTER
SCREWDRIVER, All Types
SHACKLES
SHEATH, PLUMB BOB
SHIMS
SILICONE SPRAY
SOAP
SOAP STONE
SOLDER
SOLVENT
SPONGE
STAKE - survey
STAPLES
STRING, NYLON
TACKS
TAG, BLANK, WIRE TWIST
TARPAULIN
TAP, TAPER, HAND
TAPE - adhesive, masking, friction, rubber, plumbers, etc.
TEMPIL STICKS
THIMBLES, WIRE ROPE
TIP, TORCH WELDING
TOOL BOXES, BINS
TOOL, BRUSHING for Vacuum cleaner
TOOL, CREVICE, 15" for Vacuum
TOOL, MAJOR FLOOR, 14"
TOOL STEEL
TOWEL – Paper

ANDRITZ Hydro

DISC, GRINDING
DISINFECTANT
DISPENSER, PAPER CUP
DRESSING, BELT
DRILL BIT – Small Hand Tool, All Types
EDGER, CONCRETE HAND
ELECTRODE HOLDERS
NIPPLES, HOSE
NOZZLE, WATER
NUT RUNNER
NUT SETTER
OFFICE SUPPLIES
OIL - all types
PACKING MATERIAL
TORCH, HEATING
TORCH, CUTTING
TROWEL, HAND
TRUNBUCKLES
TURPENTINE
TWINE
VISQUEEN – Non-reinforced

ANDRITZ Hydro

3. SMALL TOOLS

ADAPTER - hose, pipe thread
ADZE
ANVIL
APRON
ARBOUR
AUGER, GASOLINE (Post Hole Digger)
AWL
AXE
BABBITT
BANDING MACHINE – Hand Type
BAR- claw, crow, pinch, etc.
BARREL- trash
BASE, MAGNETIC/DAILY TEST INDICATOR
BELT- safety w/strap
BENDER - hydraulic, manual
BENDER, CABLE
BENDER, PIPE
BENDER, TUBING
BENDER, LOAD
BEVEL
BEVELLER - load
BINDER - load
BIT - auger, carpenter
BLOCK - chain, rope, cable, etc.
BLOCKS, WOOD
BLOCKS, METAL – Snatch
BLOWER – Pneumatic Powered
BOB, PLUMB
BOSUN CHAIRS
BOX - tool box or tool bag
BOX, GANG (Craft Storage)
BRACE - ratchet
BROOMS
BURNER, WEED
DOOR HANGING KIT
DRESSER - grinding wheel
DRILL - all types: hand, electric, pneumatic
DRILL PRESS
DRILL STAND - bench
DYNAMOMETER
ELCOMETER - paint thickness gauge
EMBOSSER, TAPE, HAND
ETCHER, ELECTRIC
EXPANDER- tube
EXTENSION, SOCKET SET
EXTENSION CORD
EXTRACTOR - pipe & screw
FAN - electric
FILE - hand
FLARING TOOL
FLASHLIGHT - c/w bulb & batteries
FLATTER - blacksmith
FLOAT, CONCRETE – Hand Only
FORGE - blacksmith
FORK - barn
FULLER - blacksmith
FURNACE, PROPANE – Melting
GAD
GAUGE- drill, feeler, wire thickness, tire, etc.
GRINDER- electric, pneumatic
GRAB, PIPE OF 20"
GRINDER, ELECTRIC
GRIP- cable
GROOVING, TOOL
GUN- grease caulking, paint, heat (115V), pop rivet, powder actuated, soldering
MOVER - freight car, hand
NAILER, AIR
NIBBLER, SHEET METAL
NIPPER
NOTCHER, PIPE
NOZZLE - hose, weld
NUT - die, driver
OILER - can, hand
OVEN - welding rod
PAIL
PEDESTAL, GRINDER
PIN, BARREL
PIN, BULL
PIN, DRAFT
PINCER
PLANE – wood
PLANE, BENCH JACK
PLANE, BLOCK
PLANE, ELECTRIC
PLANE, VERSI
PLANNER, POWER BLOCK – Electric HD
PLIERS – all types
PLUMB BOB
POINT - trammel
POLE - pike, range
POT - melting, fire, welding rod, lead
POUCH - tool
PRESTOLITE OUTFIT
PROTRACTOR
PULLER, FUSE SAFETY
PULLER, WHEEL GEAR
PULLER- nail, wire, spike road
PULLEY, CABLE
PULLEY, WELL
PUMP- hand, barrel, sump, test
SOLDERING IRON
SPADE
SPEED, PORTABLE
SPIKE- marlin
SPRAYER, ORCHARD
SPREADER, FLANGE
SQUARE- combination, framing, etc.
SQUEEGEE
STAND, DRILL
STAND, GRINDER
STAND, PIPE
STAND, REEL, TELESCOPING SCREW
STAPLE- tacker
STAPLER, ELECTRIC OR HAND
STAR DRILL
STEAM HEATER
STENCIL- steel, brass, paper
STONE - OIL
STRAIGHT EDGE
STRAINER- air line
STRAPPER
STRIPPER- wire
SUPPORT, PIPE – Roller type
SWEDGING TOOL KIT
SWIVEL
TACHOMETER
TAMPER- hand, pneumatic
TANK, LP – 20# only
TAP- bolt, pipe, wrench
TAPE- steel measuring
TAPEWRITER, EMBOSSING – Hand type
TAPPER
TELEPHONE- hand set, electrician's testing

ANDRITZ Hydro

CABLE - welding, electrode, ground, etc.
CALLIPERS
CANS
CART - concrete
CART, WELDING BOTTLE 2
CASTERS
CAULKING TOOL - yarning iron
CENTER FINDER SET - Wiggler
CHAIN - surveyor, measuring, steel loading
CHAIR, BOSUN'S
CHARGER - battery
CHUCK - taper, drill
CLAMP - pipe, aligning, saw, carpenter, etc.
CLIMBER – Adjustable w/Pad and Straps
CLIPPER - bolt
COOLER - drinking water
COMBINATION SETS – 6" to 18"
CONNECTOR - welding, cable
CONVEYOR - gravity, roller
CORD - electric extension
COUPLING - hose
CREEPER, FLOOR
CRIMPER, BAND
CRIMPER - electrician's
CRIMPING TOOL - Wire
CUTTER - bar, wire, pipe-hand, pipe-geared, gasket, etc.
CYLINDER, HYDRAULIC – for Porta Powers
DIE- pipe, bolt, c/w head, stock
DIGGER - hand, pneumatic
DIVIDER – wing
DIVIDER, SPRING TYPE
DOLLY, BARREL
HACKSAW, POWER
HAMMERS - all types: pneumatic, hand
HANDLES - all types
HATCHET & HANDLE - for hand threader sets
HATCHET, WRENCH
HEATER - portable: fuel, electric (115V), LP, Kerosene
HOD - brick, mortar
HOE
HOIST - portable, all types
HOOD - welding, sandblasting
HOOK - packing, eye, cant, lug, etc.
HORSES - mason, saw
INDICATOR - dial, test
IRON - tire
JACK - flange, hydraulic, mechanical, screw
JIG - weld coupon bending test
KEY - welding, gas tank
KNIFE - draw, putty
KNOCKOUT, HAND
LADDER - steel, extension, etc.
LADLE - melting, lead
LANTERNS - all types
LEAD JOINT RUNNER
LEVEL - hand, line, etc.
LIGHT - portable, flood, drop
LINE - mason, chalk
LUBRICATOR - air line
MALLET
MANDREL - all types
MARKER, LIME, ROLLING
MATTOCK
MAUL
MEGGER METER
METER - vibration
METER, AMP – Clamp-on w/Case
PUNCH- center, back out, arch, knockout, hob, gasket, sheet metal, stud, etc.
RADIO- portable, 2 way, intercom
RASP
REAMER- pipe, bridge burring, etc.
REAMER, INNER, OUTER – for copper tubing
REAMER, SPIRAL – Pipe only
REAMER, STRAIGHT – Pipe only
REEL, TIE WIRE
REGULATOR- welding gas
RESPIRATOR- dusts c/w refill
RIGGERS ROPE- manila, wire
RIVERTER, HAND
ROLLER, PIPE
ROLLER, paint
ROUTER, ELECTRIC
RULES- all types
RUSH DRILL
SANDER- disc, belt
SAW - portable, all types: hand, power
SCALER, NEEDLE
SCRAPER- bearing, miscellaneous
SCREW STOP
SCREW PLANE (set)
SCRIBER SET- nail, rivet
SHARPENER, DRILL BIT
SHEAR- bar, tinners
SHEAR, ANGLE IRON
SHEARS, ELECTRIC, HAND
SHEARS, TRIMMING, ROTARY
SHEAVES, CABLE, TRAY METAL
SHEETING- plastic, paper
SHIELD- face
SHOVEL
SIREN, ELECTRIC
SLEEVE- morse, taper, shank
TEMPLATE, HINGE-BUTT
TESTER- battery, hardness, antifreeze, circuit, insulation, motor rotation, etc.
THIMBLE- pipe
THREADER- pipe chain, etc.
TONGS, BRICK CARRIER
TONGS, CHAIN
TONGS, PIPE
TONGS, SHEET METAL
TONG- blacksmith, pipe,
TOOL, FLARING
TOOL, PICK UP, MAG
TOOL, SOIL PIPE ASSEMBLY
TOOL- clamping (hose)
TOOLS- cement worker
TORCH- blow, soldering
Cutting, propane, acetylene, prestolite
TRANSFORMER- dry type
TROLLEY
TROWEL
TRUCK- hand
TURNBUCKLE
TWISTER- wire
UMBRELLA
UNIVERSAL – for socket sets
VACUUM CLEANER, HD
VIBRATOR, CONCRETE- pneumatic, Electric
VISE, MACHINIST
VISE, PIPE
WEDGE
WELDING TOOLS
WELDING & CUTTING OUTFIT (Oxy/Acetelyne)
WHEEL- grinding
WHEELBARROW
WINCH- hand
WRENCHES- all types

ANDRITZ Hydro

DOLLY, BEAM
DOLLY, CATERPILLAR
DOLLY, MACHINE
DOLLY, PIPE
DOLLY, PRY
DOLLY, WAREHOUSE
DOLLY BAR - pivot
METER, MILLIVOLT
METER, MOISTURE
METER, VOLT
MICROMETER
MIRROR, INSEPCTION
MITER BOX – Electric or hand
MORTISER, LOCK - Electric
SLING- canvas, pipe, wire, rope, nylon
SNIP- tinner
SNIPS, AVIATION, HAND
SNIPS, METAL CUT, HAND
SNIPS, TRIM HAND
SOCKET for hand tools only
SOCKET SET

ANDRITZ Hydro

EQUIPMENT RATE SCHEDULE

Equipment	Manufacturer and Model Number	Size	Year	Quantity Available	Hourly Usage Rate CAD	Daily Usage Rate CAD	Weekly Usage Rate CAD
4 TO 1 MULTIPLIER - 1/2 IN 3/4 OUT	N/A	N/A	N/A	As Required	$ 6.79	$ 27.14	$ 97.94
6 TO 1 MULTIPLIER	N/A	N/A	N/A	As Required	$ 8.85	$ 35.40	$ 106.20
AIR COMPRESSOR - 450-CFM	N/A	N/A	N/A	As Required	$ 62.54	$ 250.16	$ 1,115.10
CHAIN FALL – 3 TON c/w 20 Ft Fall	N/A	N/A	N/A	As Required	$ 10.03	$ 40.12	$ 127.44
CHAIN FALL – 5 TON c/w 20 Ft Fall	N/A	N/A	N/A	As Required	$ 16.52	$66.08	$ 226.56
COME - A - LONG – 3 TON	N/A	N/A	N/A	As Required	$ 8.85	$ 35.40	$ 96.76
DRILL - MAGNETIC 5/8" [PORTA MAG]	N/A	N/A	N/A	As Required	$ 12.98	$ 51.92	$ 198.24
EXT. HIGH VOLTAGE POWER CHORD 50 FT	N/A	N/A	N/A	As Required	$ 3.54	$ 14.16	$ 46.02
FAN - AIR MOVER - 20" ELECTRIC (Exhaust Fan)	N/A	N/A	N/A	As Required	$ 12.98	$ 51.92	$ 140.42
FORK LIFT 5000#	N/A	N/A	N/A	As Required	$ 33.34	$ 133.34	$ 472.00
FULL FACE RESPIRATOR	N/A	N/A	N/A	As Required	$ 3.84	$ 15.34	$ 59.00
GAS DETECTOR [PULL TUBE SNIFFER]	N/A	N/A	N/A	As Required	$ 14.16	$ 56.64	$ 140.42
GAS GENERATOR 110 VOLT	N/A	N/A	N/A	As Required	$ 18.88	$ 75.52	$ 305.62
HYDRAULIC TORQUE WRENCH 1-1/2" DRIVE c/w PUMP	N/A	N/A	N/A	As Required	$ 69.62	$ 278.48	$ 1,008.90
IMPACT WRENCH - 1" [ELECTRIC]	N/A	N/A	N/A	As Required	$ 14.75	$ 59.00	$ 219.48
INSTRUMENTATION BOX	N/A	N/A	N/A	As Required	$ 23.60	$ 94.40	$ 236.00
PIPE THREADER – #535 c/w UNI HEAD	N/A	N/A	N/A	As Required	$ 13.28	$ 53.10	$ 228.92

ANDRITZ Hydro

Equipment	Manufacturer and Model Number	Size	Year	Quantity Available	Hourly Usage Rate CAD	Daily Usage Rate CAD	Weekly Usage Rate CAD
RADIO - 2 WAY C/W HOLSTER & SPEAKER (c/w charger)	N/A	N/A	N/A	As Required	$ 2.95	$ 11.80	$ 59.00
SAFETY HARNESS c/w SHOCK ABSORBING LANYARD	N/A	N/A	N/A	As Required	$ 2.95	$ 11.80	$ 59.00
SHACKLE 35 TON	N/A	N/A	N/A	As Required	$ 14.75	$ 59.00	$ 147.00
SMOKE EATERS	N/A	N/A	N/A	As Required	$ 5.61	$ 22.42	$ 114.46
SOCKET SET 1" DRIVE [IMPERIAL] c/w RATCHET	N/A	N/A	N/A	As Required	$ 14.75	$ 59.00	$ 147.50
SUMP PUMP	N/A	N/A	N/A	As Required	$ 7.38	$ 29.50	$ 82.60
TEMPERATURE GUN	N/A	N/A	N/A	As Required	$ 7.67	$ 30.68	$ 155.76
TOOL CONTAINER - 20' STANDARD (Empty)	N/A	N/A	N/A	As Required	$ 33.63	$ 134.52	$ 187.62
TRANSFORMER STEP DOWN 600V TO 480V	N/A	N/A	N/A	As Required	$ 16.23	$ 64.90	$ 250.16
TRANSFORMER STEP UP 480 TO 600 VOLT	N/A	N/A	N/A	As Required	$ 16.23	$ 64.90	$ 250.16
WELDER - 400 AMP ELECTRIC - C/W 150' CABLE	N/A	N/A	N/A	As Required	$ 18.29	$ 73.16	$ 142.78
WELDER PANEL - 575V or 460V x 6 OUTLET	N/A	N/A	N/A	As Required	$ 8.56	$ 34.22	$ 175.82
WRENCH - COMBINATION SET 11/2" TO 21/2"	N/A	N/A	N/A	As Required	$ 14.75	$ 59.00	$ 147.50
VEHICLE - BOOM TRUCK - 15 TON	N/A	N/A	N/A	1	$ 194.70	$ 778.80	$ 3,894.00
TRUCK - 1 TON FLATDECK	N/A	N/A	N/A	1	$ 29.50	$ 118.00	$ 708.00
MOBILE CRANE 160T	N/A	N/A	N/A	1	$2,227.50	$8,910.00	$44,550.00
MOBILE CRANE 90T	N/A	N/A	N/A	1	$1,471.50	$5,886.00	$29,430.00
MOBILE CRANE 60T	N/A	N/A	N/A	1	$1,077.30	$4,309.20	$21,546.00
BOOM TRUCK 30T	N/A	N/A	N/A	1	$823.50	$3,294.00	$16,470.00

ANDRITZ Hydro

1. The rates include the cost of equipment rental, fuel, lubricants, tires, expendable parts, service, maintenance, calibration, repairs, storage, insurance, licenses, depreciation, interest, taxes, overhead, mark-up and profit.

2. The rates include labour and equipment for fuelling, lubricating, servicing, maintaining, repairing, spare parts and installation.

3. The rates exclude operator's labour costs which shall be compensated as per Article 26 and Exhibit 2 Compensation and Exhibit 3 Coordination Procedures.

4. Rates are applicable to actual operating and standby time.

5. For any equipment not listed, rental rates will be agreed to in writing by Company prior to the deployment and use of such equipment. Equipment rented or leased from a Third party shall be compensated as per Article 26 and Exhibit 2 Compensation and Exhibit 3 Coordination Procedures. Third Party leasing shall be approved by Company in advance of the deployment and use of such equipment..

6. If approved by Company, the time required to mobilize and demobilize equipment not located at the Work Site and which is to be deployed at the Work Site on Change Order Work will be compensated. Compensation will be as per Article 26 and Exhibit 2 Compensation and Exhibit 3 Coordination Procedures.

Estimated Trade Person-Hour Schedule
Package Number: CH0032

Trade Type	Trade Classification	Number of LOA Person-Days	Travel KMs	Regular Time Person-Hours	Overtime (1.5x) Person-Hours	Overtime (2.0x) Person-Hours	Second Shift Person-Hours	Third Shift Person-Hours	Travel Time Hours	Total Person-Hours
Elevator Constructors	Mechanic	0	0	0	0	0	0	0	0	0
	Mechanic in-charge (4 or more)	0	0	0	0	0	0	0	0	0
	Mechanic in-charge (30 or more)	0	0	0	0	0	0	0	0	0
	Probationary Helper I	0	0	0	0	0	0	0	0	0
	Probationary Helper II	0	0	0	0	0	0	0	0	0
	Helper I	0	0	0	0	0	0	0	0	0
	Helper II	0	0	0	0	0	0	0	0	0
	Improver Helper	0	0	0	0	0	0	0	0	0

*LOA = Living Out Allowance.

Notes:

Apprentices: The hours under 1st year apprentices are for the total pool of apprentices. Actual amount of 1st year, 2nd year etc. will be according to worker availability.

Travel km: Based on a schedule of 21 work days/7 days off, and an average distance traveled to the provenance airport of 175km.

EXHIBIT 3

COORDINATION PROCEDURES

TABLE OF CONTENTS

1 INTRODUCTION

This Exhibit 3 – Coordination Procedures is intended to govern Contractor and Company in the administration and management of the Agreement.

Contractor shall use its own systems, methods and procedures in the administration of the Work. However, Company has certain requirements regarding Agreement administration, monitoring and coordination, consistency and project controls with which Contractor shall comply. These requirements are described in this Exhibit 3. Where necessary, Contractor shall adapt its own systems, methods and procedures to satisfy such Company requirements.

It is Company's intention that Company and Contractor work together to mutually agree on a set of methods and procedures for performing the Work. In this regard, Company will require a series of meetings in Company offices immediately following Effective Date. During the meetings, Contractor and Company will review Contractor's proposed methods and procedures for executing the Work. Following this review, the Parties will agree on any modifications to Contractor's methods and procedures required to satisfy the requirements of this Exhibit 3.

The following additional Exhibits have been provided to specify Company requirements and Contractor responsibilities with respect to Health and Safety Requirements (Exhibit 5), Environmental and Regulatory Compliance Requirements (Exhibit 6), Quality Requirements (Exhibit 7), Site Conditions (Exhibit 12) and Provincial Benefits (Exhibit 13).

2 EARLY ACTIVITIES AND GENERAL EXECUTION

2.1 SCOPE

This Section 2 sets forth minimum early activities associated with preparation for execution as well as general execution activities.

2.2 OBJECTIVES

Contractor shall employ a systematic management approach to the Work embracing sound management principles, including:

a) Finalization of an Execution Plan as it pertains to the Work (as described in Section 2.4 below); and
b) Understanding of and alignment with Company's objectives, priorities, and philosophies with the aim of Contractor developing appropriate plans and procedures.

2.3 CONTRACTOR DUTIES

Contractor shall:

a) Review Contractor's proposed Execution Plan with Company. Update the plan with all Accepted changes and enhancements and maintain on an ongoing basis;
b) Participate in meetings, as scheduled by Company, to mutually agree on methods and

procedures for performing the Work. Meetings shall be held in Company offices and may be scheduled to begin within fourteen (14) days of the Effective Date and shall be completed within forty-five (45) days of the Effective Date;

c) Provide all information requested by Company to support Company's appraisal of Contractor's performance of the Work, including performance of Subcontractors. Such information may include, without limitation, Contractor's systems, methods and procedures for performing the Work; copies of calculations, working drawings, specifications, purchase requisitions and recommendations (if applicable); estimates; labor productivity data; schedules; procedures; and alternative studies;

d) Contractor shall maintain close management alignment with Company during execution of the Work;

e) Actively support and participate in project reviews as required by Company and as they relate to the Work.

2.4 SPECIFIC REQUIREMENTS

Early Deliverables

A list of all early deliverables and the timing of their submission to Company is specified in Exhibit 4 - Supplier Document Requirements List.

Execution Plan

Contractor shall make all changes based on Company's comments and submit a final Execution Plan (based on the bid submission Execution Plan) to Company for Acceptance by the date specified in Exhibit 4 – Supplier Document Requirements List. The Execution Plan will serve as the basis for developing the detailed plans for the Work.

The Execution Plan shall:

a) Document the results of the overall planning process for the Work. The Execution Plan is a framework from which will evolve execution strategies and approaches, work plans, risk identification and mitigation plans, detailed procedures, organizational structures, logic networks, schedules and other material needed by Contractor's Personnel to develop execution details and Contractor's plans for the Work, including detailed fabrication and construction plans;

b) Document Contractor's objectives, priorities and philosophies that are based on and consistent with Company's objectives, priorities and philosophy for the Work; and

c) Outline formalized processes to be employed to identify broad strategic issues, evaluate impact, develop mitigation measures/action plans, and to follow-up on results of mitigation measures/action plans.

Contractor shall maintain the Execution Plan as a living, working document. Changes to such plan will be subject to the review and Approval of Company. As changes arise, Contractor shall identify and document critical issues and/or potential constraints that could adversely affect the accomplishment of Company's objectives for the Work and shall submit such changes to

Company for Approval.

Coordination Teams

As one of the early project activities, coordination teams will be established at various levels within Contractor's and Company's organizations. Contractor and Company will mutually agree on the composition of each team and agree on the frequency of meetings. If there is a failure to agree on such composition and/or frequency, Company Representative shall have the authority to determine these matters.

The initial meetings of the coordination teams will be to:

a) Develop positive working relationships between team members;
b) Develop plans to meet objectives, guidelines for individual and team behaviors, and teamwork, and determine Contractor / Company success criteria;
c) Identify and review, as appropriate by team, challenging areas or areas of opportunity which require special attention; and
d) Establish the initial framework for the specific plans for the Work as referenced in this Exhibit 3.

3 ORGANIZATION, ADMINISTRATION AND REPORTING

3.1 CONTRACTOR DUTIES

Contractor shall:

a) Submit proposed, and Accepted or Company Approved organization charts, identifying key positions required for executing the Work. These shall be included within the Execution Plan;
b) Provide information required by Company and seek Company's Approval on matters as required by the Agreement;
c) Participate in regular meetings with Company and Company's Other Contractors to discuss the status of the Work, methods for resolving problems encountered or anticipated, and other topics pertinent to the Work;
d) Produce timely, accurate and consistent progress reports for the Work that facilitate proactive management of the Work;
e) Provide to Company Group Personnel offices, logistical support and facilities at Contractor's offices and the Worksite(s), as outlined in the Agreement and as required by Company;

3.2 SPECIFIC REQUIREMENTS

3.2.1 CONTRACTOR ORGANIZATION

Within the time specified in Exhibit 4 - Supplier Document Requirements List, and to be included in the Execution Plan, Contractor shall submit a description of its project organization for the Work indicating clear lines of decision making, authority and responsibility addressing as

a minimum the following:

a) Project management organization;
b) Health and Safety management organization both at home office and for the Worksite(s);
c) Quality management organization, including Quality Manager, Worksite(s) quality organizations and vendor inspection organization;
d) Engineering management organization;
e) Technical Interface management;
f) Newfoundland and Labrador Benefits Management;
g) Regulatory and environment organization(s);
h) Procurement organization, including purchasing, subcontracting and material management for both Contractor's home office and for the Worksite(s);
i) Project controls including cost and schedule management for both Contractor's home office and for the Worksite(s);
j) Technical organization, including engineering, design, constructability and document control;
k) Construction Worksite(s) including engineering support, planning, cost and schedule control, material management, quality, safety and construction operations (including field supervision);
l) Completions organization; and
m) Start-up organization.

Each organization within the overall organization of the Work shall have key Personnel assigned and have designated authority and responsibility for the given portion of Work.
For each position designated as being key Personnel, the following information shall be provided:

a) Roles and responsibilities;
b) Job titles;
c) Approval authority assigned to each position;
d) Contact address(es) and telephone number(s); and
e) Candidate's most recent resume.

Contractor shall update the organization charts, contact addresses and phone numbers as changes occur to the Work, as Contractor's overall organization changes or as requested by Company.

The organization charts shall clearly indicate how and to whom Contractor's organization for the Work reports in its home and/or any affiliated offices and the relationship of Contractor's organization for the Work to its corporate and/or departmental organization.

Listed below are Contractor's key Personnel for the management, control and execution of the Work. Contractor shall maintain up-to-date organization charts, which shall be submitted to Company in the event of changes.

POSITION DESCRIPTION (TITLE)	
Contractor's Representative	Mathieu Bertrand
Project Engineer	Lucio D'Alessandro
System Engineer – Hydro-Mechanical Equipment	Gerhard Kohlberger
Commercial Manager	Nicole Hu
Documentation Control	Mary Grace Balenzano
Project Scheduler	Maryam Darvish
Quality Manager / Vendor Quality Planner	Antoine Prévault / Franz Hanger
H&S Manager	Antoine Prévault / Marcel Labelle
Environmental Manager	Antoine Prévault
Site Coordinator / Site Manager	Michele Castelli / Denis Côté
Equipment Manager	Michele Castelli / Denis Côté
HSE Site officer	Rosana Villa Vergara

Key Personnel shall be assigned on a full time basis and be committed to continue until Substantial Completion in order to maintain continuity. The appointment, transfer and replacement of key Personnel shall be subject to Company's prior Acceptance.

3.2.2 CORRESPONDENCE AND COMMUNICATION REQUIREMENTS

Correspondence and Notices

Company and Contractor shall jointly establish a correspondence plan and procedures which shall be periodically updated and kept current.

Aconex shall be utilized to manage all written communication between Company and Contractor. Aconex is an electronic document management system which is a secure, on-line platform for storing, managing and distributing project information that can be accessed via an internet connection and a web browser (www.aconex.com). The implementation of Aconex Mail will be coordinated during the kick-off meeting between Contractor and Company.

The Aconex module, "LCP Rev Controlled", will be utilized for all technical documentation (refer to the document entitled "LCP Supplier Document Requirements" provided in Exhibit 11 - Company Supplied Documents).

Administration:

A. All formal correspondence and notices relating to the Agreement shall be exchanged between Contractor's Representative and Company's Representative, using official letterhead and submitted c/o Company's Document Control via Aconex and shall carry the following: subject, date, and reference correspondence. Letters will be, to the degree possible, specific to one subject matter.

B. All deliverables, as defined in the Agreement, shall be exchanged between Contractor's Representative and Company's Representative to be defined per each deliverable.

C. All Agreement deliverables shall be submitted to Company's Representative, c/c Company Document Control via Aconex, using a uniquely numbered document transmittal.

D. All information exchanged shall be managed in accordance with Coordination Procedures, Section 14 – Information Management and all associated standards and procedures.

Company and Contractor Representatives

All formal correspondence, documents and Agreement deliverables required by the Agreement, including this Exhibit 3, from Contractor to Company shall be addressed to the Company Representative. Likewise all correspondence from Company to Contractor shall be sent to Contractor's Representative.

Company Representative

The Company Representative has the responsibility of managing the Agreement on behalf of Company, including Approval of Changes, amendments to the Agreement and issuance and receiving of Notices.

The Company Representative has the authority to stop the Work for the purposes of safety, quality and risk of damaging Company property under the care, custody and control of Contractor. Notification of stoppage can be addressed verbally, and then supported by writing. Contractor shall resume Work when appropriate actions are addressed to the satisfaction of Company. No compensation will be provided for Work stoppages of this nature.

The Company Representative may delegate any of his or her responsibilities to any nominated deputy. Notice of delegation shall be provided to Contractor's Representative in writing.

Contractor's Representative

Contractor shall appoint a Contractor's Representative for the Work, who shall have full authority to receive instructions and administer the Agreement for and on behalf of Contractor, in addition to those authorities stated in the Articles of the Agreement.

The Contractor's Representative shall have the responsibility for receiving, acknowledging, countersigning and returning any instructions, decisions, Notices, authorizations and acknowledgements to Contractor under the Agreement, in addition to those responsibilities stated in the Articles of the Agreement. Contractor's Representative shall also be responsible for administering, monitoring, reviewing and coordinating all aspects of the Work on behalf of Contractor.

Contractor's Representative may delegate any of his or her responsibilities to any nominated deputy upon prior Notice to the Company Representative. Notifications, information, authorizations, acknowledgements and decisions from any such nominated deputy shall be as if from Contractor's Representative.

3.2.3 REPORTS AND MEETINGS

Contractor shall submit reports to Company on the progress of engineering, procurement, construction and completions, and on the status of other activities for the Work as otherwise provided below and other provisions in this Exhibit 3 (See Section 7.7 for further details).

Weekly Report

Contractor shall submit a weekly report ("Weekly Report"), which shall reflect the current status of the Work, progress and issues. The timing, format and content shall be as agreed between Contractor and Company, but shall address the following as a minimum:

- Brief summary of status of the Work;
- Management and administration;
- Significant items planned for the following weeks;
- Health, safety and environment;
- Quality management;
- Highlights and concerns including any required and implemented corrective action in all of the following main areas:
  - engineering
  - procurement
  - manufacturing
  - fabrication
  - construction
  - installation
  - completions;
- Interface activities;
- Status of Change Requests; and
- Receipt of major components and/or materials at the Site.

Monthly Progress Report

Contractor shall submit a monthly progress report ("Monthly Progress Report") based on a cut-off date of the 25th of each month.. The timing of the submission of this report shall be by close of business no later than the 5th calendar day of the following month. The first Monthly Progress Report shall be issued not later than forty-five (45) calendar days after the Effective Date. The format and content of the Monthly Progress Report shall be as agreed between Contractor and Company, but shall address the following as a minimum:

a) Highlights, in bullet point style, of the significant accomplishments achieved and issues addressed during the reporting period;
b) A description of problems or delays encountered or anticipated, and corrective actions initiated or contemplated to counteract or minimize the effect of such problem, together with the results of any corrective actions already taken;

c) The Worksites' safety status including health and safety statistics for the past month and for the Work to date. The content and format for the safety statistics are provided in Exhibit 5 – Health and Safety Requirements. Major safety problems shall be highlighted and action plans to improve conditions outlined. Safety initiatives undertaken during the past month and/or planned for the forthcoming month shall be discussed;
d) Short narrative covering all significant events during the reporting period;
e) Management, including mobilization, systems implementation, procedures development and other administrative activities;
f) Current status of the Work. Progress data (progress curves, histograms, productivity information and Summary Schedules) shall be provided on graphs which show actual versus planned progress as further described in Section 7 of this Exhibit 3 for: (i) engineering, (ii) equipment and materials orders, (iii) equipment and materials deliveries at the Worksite(s), (iv) construction, (v) completions and (vi) overall Work progress. For activities that are behind schedule, an analysis of reasons for the slippage shall be included, together with a description of actions to be taken to recover;
g) All constructability issues;
h) The quality status including quality statistics for the past month and for the Work to date;
i) Interface management status;
j) Cost and financial reports as defined and/or specified in Sections 6 and 12 of this Exhibit 3;
k) The status of planning, scheduling and schedule control, including coverage of relevant activities called for within Section 7 of this Exhibit 3;
l) The status of Changes, if any, and the corresponding current value of the Contract Price including the effect of Change Orders and Change Requests;
m) The status of procurement and subcontracting, including placement of Subcontracts, status of spare parts orders, performance of Subcontractors (including Subcontractors' subcontractors of every tier), and Subcontract administration matters;
n) The status of items involving Authorities such as inspections, approvals, permits, clearances and licenses, as further described in Exhibit 6 - Environmental and Regulatory Compliance Requirements;
o) Provincial Benefits report as described in Exhibit 13 – Provincial Benefits;
p) Monthly risk report consisting of the following:
    - A structured narrative that describes major risk activities and events during the reporting period containing major changes in the Risk Register (as defined in Section 9.1(c) below) with a focus on medium and high level risks;
    - Highlights of five (5) to seven (7) most important package risk management activities and events; and
    - An updated Risk Register (as defined in Section 9.1(c) below); and
q) Status of planned tests and/or hold points.

Final Contract Report

A final report summarizing the Work shall be submitted by Contractor to Company Representative for Approval, the content and timing of which shall be specified by Company Representative.

Meetings

Meetings of key Contractor's Personnel, Company Representative and/or Company Personnel, shall be held regularly.

Monthly and weekly progress meetings will be held, details of format and content of which will be as agreed between Contractor and Company.

Company may hold other meetings with Contractor to discuss matters of technical, interface management, health, safety, environmental, design, quality, verification, certification, documentation, engineering data, cost, accounting, scheduling, construction, progress and the like, and as may be otherwise required for the Work and the Agreement. Contractor shall ensure sufficient and appropriate qualified Personnel are available to attend.

In general, meetings shall adhere to the following guidelines:

a) The agenda items for any meeting will be issued to the Parties no less than two Business Days prior to such meeting. Company and Contractor shall ensure, in accordance with their respective responsibilities, that reports, reproducible documentation and forward planning information relating to agenda items are issued in sufficient time to allow adequate preparatory study and evaluation;
b) The meeting will address only the items covered by the agenda and any other minor topics relevant to the Parties and subject concerned;
c) In those instances where matters of urgency need to be addressed, Company and Contractor will make every effort to address such items at the earliest opportunity; and
d) It shall be the responsibility of Contractor to record minutes of all meetings unless otherwise instructed by Company. Minutes should be brief, indicate with whom the responsibility for action lies, the date the action was assigned and the date required for completion of such action. Minutes should also state the results of assigned actions outlined in previous minutes, including the actual date of completion of the action.

Photographs

Contractor shall provide photographs as Company may request of sufficient quality for possible inclusion in Company's publications depicting significant activities and general progress of the Work.

3.2.4 INFORMATION SYSTEMS AND TECHNOLOGY (IS/IT)

Contractor shall:

a) establish and maintain an IS/IT infrastructure and associated computing environment to ensure overall reliability, performance and security control;
b) provide access, for Company and Company Personnel, to any software applications and supporting services required in order for Company to perform their work;
c) maintain an upgrade path for electronic formats that will keep data formats compatible with that of Company;

d) securely transfer data and information electronically to Company on a timely basis using industry recognized standards, processes, systems and methodologies;
e) ensure control practices and risk mitigation plans are in place to provide protection and safeguard for all data and information related to the Work including but not limited to access management, data corruption, data loss, backup and disaster recovery procedures; and
f) provide to Company a description of the IS/IT support organization and how it is structured to support the Work.

3.2.5 DATA

All documentation and information, including correspondence, notes reports, information identified and/or required by the Agreement, drawings, specifications, schedules, weekly, bi-weekly and/or monthly reports, databases, records, videos, photos and other documents (hereinafter collectively referred to as "Data") shall be made available to Company in electronic PDF format as well as hard copy. Contractor will provide only the system diagrams, interface and as-built drawings in native file format The transfer of Data will be by storage medium such as optical or magnetic discs. Contractor shall undertake all reasonable efforts to ensure Data is provided in a form fully useable to Company with well recognized industry standard applications.

3.2.6 FACILITIES AND SERVICES FOR COMPANY PERSONNEL

Facilities Provided for Company by Contractor

A. Where individual Company Personnel are assigned to Contractor office(s) for extended periods of time, office space and office equipment (no computer) shall be provided to the standard afforded to Personnel of equal organizational level within the Contractor's organization.
B. Where individual Company Personnel are required to visit other Contractor office(s), temporary space shall be provided, which shall include a fully equipped (no computer) office space with phone and internet connections.

4 INTERFACE MANAGEMENT

Contractor shall manage external interfaces with other organizations involved in the LCP, including Company Representative, Company's Other Contractors and their subcontractor(s) and vendor(s) of every tier, Authorities and other entities associated with the Work. Refer to Scope of Work Specification for further information on interfaces at each of the worksites.

4.1 OBJECTIVES

Contractor shall:
a) Have primary responsibility for managing technical and execution interfaces and thus coordinating its activities with other organizations as required to effectively accomplish

the Work;

b) Identify major interfaces early in the Work through a structured process;
c) Define the interface information needed for the Work. Contractor and other interfacing entities (including originating and responding organizations) shall then agree on roles, responsibilities and timing for providing agreed upon information or actions;
d) Ensure that all communications with other organizations shall be clear, accurate, timely and consistent to accomplish their intended purpose of transferring information between organizations or ensuring agreed action is taken to progress the Work;
e) Ensure that interface resolution issues with potential for impacts to cost or schedule shall be identified quickly and communicated to all interfacing entities, including Company, in order to minimize their impact; and
f) Cooperate with Company and comply with the requirements of Company's interface management system as it relates to the Work.

4.2 SPECIFIC REQUIREMENTS

Contractor shall:

a) Develop an interface management plan and shall implement systems and methodology for ensuring the identification of originators and responders, quality, accuracy and timeliness of interface information;
b) Incorporate the schedules for submittal of its deliverables (as determined by interface management activities) as Milestones in Contractor's schedule for the Work. Contractor shall manage compliance with such Milestones accordingly;
c) Schedule and participate in interface coordination meetings with Company, Company's Other Contractor(s), and their subcontractor(s) and vendor(s) of every tier, and other organizations, as required to properly manage interfaces; and
d) Regularly advise Company on the status of resolution of interface issues. Contractor shall promptly elevate unresolved interfaces and interface issues to Company for resolution.

5 PROCUREMENT AND MATERIAL MANAGEMENT

Contractor shall maintain records of materials procured for the Work. Company will have the right to carry out periodic inspection of all Contractor's storage and inventory control records for the Work as well as physical spot checks of all material held in storage.

A logistics and transportation plan shall be produced by Contractor and submitted to Company by the date specified in Exhibit 4 – Supplier Document Requirements.

5.1 COMPANY SUPPLIED ITEMS

Contractor shall:

a) Receive from Company any Company supplied items associated with the Work and as applicable unload, unpack, inspect, and confirm receipt and condition of receipt by issuing a material receiving report to Company confirming Contractor acceptance of items and the condition of items at the time of acceptance;

b) Ensure that all materials are used correctly and no materials are substituted without prior Company Approval;
c) Be responsible for the security and safe keeping, in accordance with good industry practice and Company's and the manufacturers guidelines/instructions for preservation and storage, any Company supplied items associated with the Work and ensure all items are visually marked as being provided for the Work;
d) Maintain index records and account for any Company supplied items received and installed, and the remaining surplus and scrap. The index shall, at a minimum, include description, part number, serial number, storage location, status and receipt date;
~~e)~~ Be responsible for any costs incurred as a result of Contractor's failure to properly store, preserve and protect Company supplied items.

Company shall:
a) If applicable, supply Company supplied items complete with available documentation to demonstrate traceability and quality assurance to Contractor; and
b) Have the right to inspect Company supplied items at Contractor's and Subcontractor's storage location(s) and storage records at any time without prior Notice. Such inspection shall not relieve the Contractor of any responsibility for the accountability and safe keeping of Company supplied items.

6 COST MANAGEMENT

Cost Control of Accounts

Company will provide cost control accounts to Contractor within thirty (30) days of the Effective Date. The cost control accounts will be cross referenced to the compensation amounts outlined in Exhibit 2 – Compensation.

Cost Report

Contractor shall submit an estimated incurred cost flow report, consistent with the control accounts and payment elements contained in Exhibit 2 – Compensation based upon a cut-off date of the 25th of the month. This report shall be by month for the duration of the agreement (monthly forecast of incurred cost) and shall be submitted by the 20th of each month. Accordingly, the final five day period of the month shall be estimated. It is understood the Contractor will not disclose any of its actual costs. The report will provide approximate dollar amounts In a format similar to the reports generated under contract CH0030.

Contractor shall prepare a finance report to be included as a section of the Monthly Progress Report. Reporting will be consistent with the control accounts and payment elements contained in Exhibit 2 – Compensation. Contractor shall submit to Company a sample cost report for Company's Approval. In general, the finance report shall address the following as a minimum:
a) Contract Price and all changes thereto;
b) Forecast final Contract Price (previous period, current period and monthly variance);

c) Reimbursable cost status, if applicable;
d) Change Order status;
e) Contract incurred cost flow described above (actual/forecast); and
f) Invoice and payment status, including cash flow forecast by currency.

7 SCHEDULE MANAGEMENT

This Section 7 sets forth the minimum requirements for Contractor's planning, scheduling, measurement and reporting of physical progress, and schedule control activities for the Work.

7.1 DEFINITIONS

a. **Earned Value Management**: A method to measure the value of Work performed. Earned value uses current budgets and progress-to-date to show whether the incurred values are on budget and/or whether the tasks are ahead or behind the Approved Control Schedule. A method for measuring Work productivity and performance; it compares the effort of Work that was actually expended with what was physically completed.

b. **Control Schedule (CS):** The Control Schedule forms the basis to measure progress in which cost, schedule, scope and other performance criteria are formally compared against the Approved Control Schedule Baseline Document for assessment of progress and performance. The Control Schedule forms the benchmark for comparison and identification of cost and schedule deviations. The Control Schedule shall represent the total Work execution and interfaces with others (Milestones, key dates, design, procurement, regulatory, fabrication and manufacturing, transportation, installation, construction and completion – both static, dynamic and support to operations) covering the entire duration of the Work, and includes roll-up details of all Contractor's schedules. The Control Schedule is to be a schedule network, which is calculated using the critical path method. Contractor will ensure that the Control Schedule aligns with Exhibit 9 – Interface and Milestone Schedule. The Control Schedule shall be developed using Primavera (P6 or later version) or equivalent. If software other than Primavera is used, the native file shall have the capability to be easily converted to Primavera P6 and shall be subject to the Acceptance of Company.

c. **Milestone:** The start or completion of an activity in the performance of the Work and which is identified as such in Exhibit 9 – Interface and Milestone Schedule.

d. **Control Schedule Baseline Document (CSBD):** A series of schedules, s-curves, histograms, tables and narrative which together form the basis of the plan to complete the Work. The Control Schedule Baseline Document is updated and re-issued following re-baselining of the Control Schedule. The CSBD includes the Control Schedule, as well as critical and near-critical path(s). The Control Schedule Baseline Document shall provide supporting documentation to the Control Schedule. It shall include all baseline assumptions regarding schedule durations, logic, installation rates, progress weighting and relevant material as deemed necessary by Company.

e. **Summary Schedule (SS):** The Summary Schedule incorporates all Milestones and is a roll-up of schedule information from the detailed Control Schedule such as engineering, procurement, construction, fabrication, installation and completions (static and dynamic to be shown separately) and any subject deemed necessary by the Company to adequately convey a rollup or the CS.

f. **Schedule Development and Control Plan (SDCP):** A formal document providing the approach to planning and schedule control including schedule development, analysis, forecasting, reporting, corrective action and the method for incorporation of Changes. The SDCP addresses the scheduling interfaces between Contractor and Subcontractors, as well as Contractor and Company. In particular, the plan shall provide a detailed description of Contractor's progress measurement system including how Contractor measures, verifies and reports physical progress of each major activity of the Work (such as engineering, procurement, fabrication, manufacturing, permitting, transportation, construction/installation and completion).

g. **Monthly Cut-Off Date**: The month end date that Contractor uses as a basis to compile its progress during the month. The Monthly Cut-off Date will be agreed between Contractor and Company based on the nature of the Work. If there is a failure to agree on such date, Company shall have the authority to determine the date.

h. **Monthly Risk Statement**: Indicates the major risks identified during the month that could represent a threat to the success of the Work, the contemplated mitigation measures for newly identified risks and the actions status pertaining to mitigation measures proposed for previously identified risks.

i. **Monthly Progress Report:** The monthly report which is described in Section 3.2.3 of this Exhibit 3.

j. **Weekly Report:** The weekly report which is described in Sections 3.2.3 and 7.7 of this Exhibit 3.

7.2 CONTRACTOR DUTIES

With respect to planning, scheduling and schedule control of the Work, Contractor shall:

a) Prepare, implement and maintain a Schedule Development and Control Plan (SDCP) in accordance with the date specified in Exhibit 4 – Supplier Document Requirements List for the Work using methods and procedures that are in accordance with Good Utility Practice;

b) Analyze and calculate earned quantities, man-hours and costs, and forecast and report the progress of the Work using industry recognized Earned Value Management practices as compared to current Work plans and overall schedule, summarizing the results of the schedule analysis in the Monthly Progress Report, which shall include a Milestone listing with target dates and current forecast dates;

c) Develop recovery plans and associated schedules if slippage is apparent, or as required by

Company. Recovery plans will be reviewed with Company and implemented upon Company's Acceptance. Recovery plans will be monitored and adjustments made as needed to keep the Work on schedule;

d) Incorporate the results of progress measurement and related status information into schedule forecasts, Weekly Reports and Monthly Progress Reports, as required under the Agreement;
e) Provide access to all details of schedule preparation, progress measurement and schedule updates when requested by Company;
f) Make changes in the schedule preparation, progress measurement and schedule control procedures at Company's request;
g) Utilize agreed Company's progress measurement definition strategy. Actual progress shall be based on physical Work completed measured against the current Work;
h) Provide Company with the Control Schedule (CS) with the baseline estimate that will hold the mechanism of measuring progress in hard copy and electronic form, in accordance with the date specified in Exhibit 4 – Supplier Document Requirements List. The native electronic file shall include all information necessary to duplicate Contractor's schedule, progress measurement analysis and resource requirements. In addition to the electronic file, the schedule software settings, calendar definitions and application generated scheduling report shall be included;
i) Take the initiative to propose potential corrective actions whenever there is an identified trend which indicates that a Milestone will not be achieved or indicates an opportunity to shorten the overall schedule, or counteract potential schedule slippages; and implement the action(s) as Accepted by the Company; and
~~j)~~ Provide a Control Schedule Baseline Document (CSBD) in accordance with the date specified in Exhibit 4 – Supplier Document Requirements List, with all supporting documentation. The (CSBD) shall be re-issued each time the (CS) is re-baselined.

7.3 SCHEDULE DEVELOPMENT AND CONTROL PLAN (SDCP)

Contractor's Schedule Development and Control Plan shall cover all areas of schedule development and control, including development, analysis, forecasting, reporting and corrective action. In particular, the plan shall provide a detailed description of Contractor's progress measurement system.

Contractor's Schedule Development and Control Plan will, at a minimum, include:

a) How Contractor's detailed schedule and current Work plans will be developed, reviewed and updated;
b) Methodology that Contractor will use to analyze and forecast the progress of the Work relative to current schedules;
c) How interface management will be addressed. Interface management includes all key internal interfaces within the Work as well as all key interfaces between the Contractor, Subcontractors and Company's Other Contractors. The plan will define how interfaces are identified, stewarded and their status reported;
d) How interfaces, outside of Contractor's control, could impact the Control Schedule;
e) The number, types, uses, frequency of updates (and responsibility for updates) and level of

detail for each of the various schedules the Contractor intends to use to control the Work;

f) Methods for analyzing critical path and conducting float analysis;
g) Procedure for re-baselining the Control Schedule (subject to Company's Acceptance);
h) Coding system for schedules;
i) The methods that will be used to measure physical progress of each of the various activities or groups of activities in engineering, procurement logistics, fabrication, manufacturing, installation, construction and completions. Methods for engineering shall specifically address use of computer aided design and drafting (CADD), both 2D and 3D;
j) Procedures within Contractor's organization for review and verification of progress measurement information prepared at each Worksite;
k) The methods to control over progressing of activities; and verification methods confirming that all activities reported as 100% complete are actually complete;
l) The method for recognizing the impact of rework on apparent progress, during engineering, procurement, fabrication, construction and completions and the method for specifically progressing and tracking the Work;
m) The methods and procedures for incorporating the effects of Changes on the assessment of progress;
n) The method for weighting and combining individual and overall progress measurements to arrive at the discipline and overall progress assessments for engineering, procurement, fabrication, installation, completions and other major activities related to the Work. Progress weightings shall be subject to Company's review and Acceptance, and once Accepted shall not be changed without Company's prior Acceptance; and
o) Contractor plans to manage and report receipt of materials and/or components at the Worksites.

7.4 CONTROL SCHEDULE BASELINE DOCUMENT (CSBD)

Contractor shall prepare and submit to Company for its review and Acceptance the Control Schedule Baseline Document in hard copy, portable document format (PDF) and native electronic format. All information required to reproduce the Control Schedule Baseline Document including scheduling software settings, working calendars, application time conversion factors, and precedence and scheduling output reports from the scheduling software, will be included with the submission.

The Control Schedule Baseline Document shall be organized into an overall summary section and a detailed section for each component of the Work (such as engineering, procurement, manufacturing, fabrication, testing and handover). Each section shall be organized as follows:

a) Assumptions underpinning the execution methodology and Control Schedule, as well as any issues that may impact the Work. This section will also include the basis for any planned changes to the Control Schedule;
b) Summary Schedule;
c) Progress curve and table;
d) Critical and sub-critical path(s); and
e) Detail schedule.

7.5 CONTROL SCHEDULE (CS)

A detailed Control Schedule for the Work will be prepared by the Contractor and submitted to Company for Approval. Contractor shall develop the Control schedule in accordance with Company's work breakdown structure and code of accounts for the Work. The detailed schedule will contain sufficient detail to demonstrate how all activities affect the, Work and Exhibit 9 – Interface and Milestone Schedule.

The Control Schedule will show activities that provide sufficient detail in all areas of Work execution (such as Milestones, key dates, design, procurement, fabrication, manufacturing, transportation, installation, construction, completions and all relevant interfaces) to enable monitoring and control of the Work. Schedule forecasts will give a complete and accurate representation of the current status of the Work, including impacts from delays and advancements, Change Orders and the consequences of productivity.

7.6 GENERAL SCHEDULING AND PROGRESS REQUIREMENTS

Contractor's planning, scheduling and schedule control activities for the Work will, at a minimum, include the following:

a) A time-scaled critical path method (CPM) logic network that shall set forth the order and estimated times by which planned activities are to be completed. This network shall identify the critical and subcritical paths (a subcritical path is defined as any series of activities whose completion is within one (1) week of the critical path completion). The logic network shall clearly indicate all restraints and interrelationships and shall incorporate Exhibit 9 – Interface and Milestone Schedule;
b) A description of those activities associated with material sources, Subcontractors and fabrication. All interfaces will be incorporated into the Control Schedule;
c) All schedule and progress information (CS, SS, tables, histograms, s-curves, document register, procurement plan, manufacturing schedule and support documentation) shall be issued on a monthly basis;
d) Progress measurements such that the physical progress of the Work can be related easily to the Control Schedule activities. Progress shall be evaluated on discrete, identifiable deliverables for each Work activity weighted by budgeted person hours or other methods to determine a total percent for each activity. Physical progress measurement relates to the assessment of the proportion of actual Work accomplished towards completion of given components of the Work;
e) The ability to assess progress for all progress earning activities required for each component of Work, regardless of source. As additional progress earning components are identified, they will be added to the base level of Work through the change management process, to be accomplished and progress measured and reported;
f) Indicate the schedule calendars used to develop the schedule including, daily work hours, work week, shift schedule, scheduled facility shutdowns (if any) and holidays. Any planned non-work periods shall be clearly indicated and a narrative shall be supplied indicating the period of non-work and the rationale for the non-work period;

g) Show status of all interfaces within the components of the Work (such as engineering, procurement, manufacturing, fabrication, construction and completions);
h) Exclude home office and field support functions, such as project management, coordination, engineering office follow-up during construction, construction and fabrication management and supervision, warehousing, material handling and clean-up, from physical progress measurements;
i) Produce and maintain a schedule network that is logically linked, with a minimal number of constraints utilized. Where constraints are required, the fewest possible constraints necessary to meet the required objective will be used. The reason for the constraint shall be noted in the notebook file for that activity. Constraints that affect the backward pass calculation of the network ("Mandatory Finish", "Mandatory Start", "Finish On Or Before", "Start On Or Before", "Finish On", "Start On") are to be strictly avoided, unless Accepted by Company;
j) Use of activity lags is discouraged. Where the use of lags is considered, Contractor shall consider if the use of an activity to represent the lag is a reasonable representation of the condition being modeled. If a lag is used, the reason and rationale for the lag shall be noted in the notebook file for that activity;
k) Scheduling option that retains the current logic ("retained logic") of activities started out of sequence will be used. Where necessary, the logic for those activities for which the relationship is no longer applicable will be manually changed;
l) Schedule time forecasting shall not be based upon the percentage of schedule completed. The scheduling control software function for linking remaining duration and such percentage shall be disabled;
m) Control Schedule will be structured to provide five (5) activity code fields, for summarization and reporting purposes, for exclusive use by Company. Each code field will be ten (10) characters in length and will be titled LCP1, LCP2, LCP3, LCP4 and LCP5. Company will provide the applicable coding to Contractor for inclusion within these code fields. Contractor will populate and maintain these code fields for all schedule activities;
n) Schedule calendars and activity codes will be prefixed with the six character package identifier and a dash (for example, "CD0502-"). This is to prevent potential data errors in the Company's planning system;
o) Schedule activity descriptions shall clearly identify the work associated with the activity, and shall be consistently applied throughout the schedule;
p) Activity durations shall not, in general, exceed twice the update frequency;
q) Start to Finish (SF) relationship types shall be avoided;
r) Open ends within the schedule network shall be avoided;
s) Network logic shall be consistently applied throughout the schedule;
t) The "Work Breakdown Structure" (WBS) shall not be the only coding system used within the schedule network. Activity codes are required to enable effective schedule development, review and analysis;
u) Gantt or bar chart displays shall have the current schedule bar assigned to position 1, with the baseline schedule bar assigned to position 2; and
v) Company will have access to all supporting documentation.

7.7 PROGRESS REPORTING

Contractor shall provide Weekly Reports and Monthly Progress Reports as described in Section 3 of this Exhibit 3 and, with respect to progress reporting, as more fully detailed below:

a) Weekly Reports shall include the following:
   - An updated resourcing plan showing the resources assigned to the project in accordance with the Contractor's Organization Chart Progress table including quantities/statistics for current engineering, procurement, and fabrication/construction/installation/completions activities;

b) Monthly Progress Reports shall include the following:
   - Planning and schedule control reports will be updated and issued monthly. Reports shall include the Control Schedule, Summary Schedule, tables, resource histograms, progress s-curves, document register, procurement plan, manufacturing schedule and support documentation. Contractor shall supply a copy of the schedule using Primavera (P6 or later version) or equivalent, as well as hard copy format. If software other than Primavera is used, the native file shall have the capability to be easily converted to Primavera P6 and shall be subject to the Acceptance of Company;
   - Deviations from schedule in time or progress, reasons for delays and deviations with recommended actions for recovery;
   - Status of planned tests and/or hold points;
   - Tabulation of project man-hours addressing planned, actual and forecast at completion;
   - Progress table including quantities/statistics for current engineering, procurement, and fabrication/construction/installation/completions activities; and
   - Identification of critical and sub-critical path(s).

8 CHANGES TO THE WORK

8.1 INTRODUCTION

This Section 8 sets forth minimum requirements for identifying and processing Changes in support of Article 26 of the Agreement and Exhibit 2 - Compensation.

Changes will be initiated in one of two ways:

a) by completing a Change Request, in the form as attached to this Exhibit 3 as Appendix A – Change Request; or
b) by the issuance of a Change Order.

Contractor shall specify its assessment of cost and schedule impacts in each Change Request or proposal presented in accordance with this Section 8.

If Company issues a Change Order to proceed with a Change on a reimbursable basis, Contractor shall prepare daily time sheets for Company's signature covering such Change and submit them to the Company within twenty four (24) hours where the Change is performed on

Site, or within one (1) week where the Change was performed elsewhere, after such Change has been performed. Company's signature of Contractor presented time sheets shall not commit Company to any particular payment in respect of the Change, but shall serve as a record of events in the eventual resolution of any difference of opinion between Company and Contractor regarding the cost or schedule impacts of the Change. Contractor shall also present details of its assessment of any effect of the Change on the Control Schedule. Neither Company's issuance of such a Change Order or Contractor's performance of Change Work pursuant to such Change Order shall prejudice the Party's respective position regarding the appropriate compensation and/or schedule impact of such Change Work. Changes performed on a reimbursable basis will be priced and paid for as per Sections 3, 4, 5, 6 and 7 of Exhibit 2 - Compensation.

Company will be entitled to an equitable reduction in the Contract Price and/or an equitable adjustment of the Control Schedule in respect of any reduction in the Work pursuant to a Change Order and in accordance with the provisions of Article 26 of the Agreement, Exhibit 2 - Compensation and this Exhibit 3.

Contractor is not entitled to recover any costs related to preparation and administration of Change Orders, responses to Change Requests or preparation of Change Requests.

Each Change Order shall be deemed to take full account of the cumulative effects on the Contract Price and of all prior Change Orders.

8.2 COMPANY REQUESTED CHANGES

Company may issue a Change Order directly to Contractor or may request a proposal from Contractor for a contemplated Change through Company by issuance of a Change Request.

Upon receipt of a Change Request from Company, Contractor shall prepare a proposal for the Change Request and submit it within five (5) Business Days to Company for further processing. Contractor's proposal shall include:

a) A detailed execution methodology for the proposed Change;
b) A detailed schedule for the execution of the Change and the impact on the Control Schedule;
c) a lump sum price for the Change (if Contractor proposes any other method of compensation it shall provide its rationale for that method); and
d) Details of the impact on the Execution Plan, the Quality Plan, the health and safety plan referenced in Article 15.2 of the Agreement and the environmental protection plan referenced in Article 15.3 of this Agreement.

If Contractor cannot present the proposal for the Change Request to Company within five (5) Business Days of the receipt of the relevant Change Request from Company, Contractor shall promptly notify Company and provide reasons for the delay and the date the proposal will be ready. Contractor shall not unduly delay submission of the proposal to Company. Company, at its sole discretion, can reject any proposal not submitted in accordance with the requirements outlined herein.

Company will review Contractor's proposal within ten (10) Business Days and either Accept and return a Change Order (in the form as attached to this Exhibit 3 as Appendix B - Change Order) for Contractor execution or reject the proposal for resubmission or cancellation.

8.3 CONTRACTOR IDENTIFIED CHANGES

Contractor may request a Change by submitting a Change Request to Company. The Change Request will include:

a) A detailed explanation of why Contractor considers that a Change has occurred along with detailed support to enable Company to easily evaluate and assess the merits of the Change Request. Contractor shall specify the relevant provision(s) of the Agreement which it interprets as the basis for the Change Request;
b) A detailed schedule for the execution of the Change and the impact on the Control Schedule;
c) a lump sum price for the Change (if Contractor proposes any other method of compensation it shall provide its rationale for that method); and
d) Details of the impact on the Execution Plan, the Quality Plan, the health and safety plan referenced in Article 15.2 of the Agreement and the environmental protection plan referenced in Article 15.3 of the Agreement.

Contractor has the responsibility to identify, by the issuance of a Change Request, any change to the Work that it believes to be necessary for environmental integrity, or that will benefit Company in terms of capital or operating cost, or improved performance flexibility, safety or operation of the Work.

8.4 CHANGE ORDER PRICE

Contractor's proposed price for any Change will generally be stated as a lump sum price. Contractor shall provide substantiation, as Company may reasonably request, regarding such proposed price. Each lump sum price for a Change shall be determined using the rates and prices outlined in Exhibit 2 - Compensation or on a basis to be agreed between Company and Contractor if there are no applicable rates in Exhibit 2 – Compensation.

For any Change proposed to be compensated on a reimbursable basis, Contractor shall include an estimated total price for the Change in the Change Request or in its proposal in response to a Change Request. Changes performed on a reimbursable basis will be priced in accordance with Exhibit 2 – Compensation.

Each Change Order shall fully define the terms of payment and invoicing provisions. Contractor shall not be entitled to additional compensation in respect of:

a) Personnel already assigned full time to the Work, except when such Personnel are paid overtime, shift premiums or their assignment to the Work is extended, specifically in relation to the Change; and
b) Contractor's Items already assigned full time to the Work, except when the hire period of rented items is extended specifically in relation to the Change.

8.5 CHANGE IMPACT ON CONTROL SCHEDULE

Contractor will submit to Company, all necessary information to support any proposed impact of a Change on the Control Schedule, in both hard copy and electronic format. The information shall include detailed critical path analysis, identification and full accounting for the use of float and the current Control Schedule.

Each Change Order shall be deemed to take full account of the cumulative effects on the Control Schedule and all prior Change Orders. Due consideration will be given to cumulative effects that may not have manifested themselves in previous Change Orders, such as a Change that is accommodated by reducing available float. Any cumulative schedule effects assessed by Contractor shall be supported by detailed analysis to account for the use of float. This analysis shall include an electronic version of the current Control Schedule that clearly highlights the schedule effects to enable Company to verify Contractor's analysis prior to the issuance of the relevant Change Order.

Contractor shall update the Control Schedule for Company's Approval within five (5) Business Days after Company's issuance of any Change Order affecting the Control Schedule.

8.6 CHANGE REGISTER

Contractor shall maintain, fully updated at all times, a register of all Change Requests and Change Orders. The register will include:

a) Change Request number and date;
b) Change Order number and date and reference to a Change Request;
c) Brief description of the Change;
d) Status of Change Request and Change Order;
e) Value;
f) Effects on Control Schedule; and
g) Brief description of the basis for the Change Request.

Each Change Request will be identified by means of a unique sequential reference number beginning with 1000 for any Change Request issued by Company, and 2000 for any Change Request issued by Contractor. Each Change Order will be identified by means of a unique reference number, which will be assigned by Company.

All Change Orders that affect the Control Schedule shall be individually detailed, by reference number and summary description, in the successive Control Schedule updates issued by Contractor for Company's Approval.

Contractor shall submit the Change register in the Monthly Progress Report or more frequently as required by Company.

9 RISK MANAGEMENT

Contractor's Risk Management activities will be a continuation of the risk assessment process initiated during the bidding process. Requirements for ongoing risk management and reporting will be agreed between Contractor and Company at the kick-off meeting. Depending on the nature of the Work, Company shall have the authority to specify the type of risks (such as schedule, quality, cost, safety and environmental) which shall be reported by Contractor subject to Article 26. Some risks will be identified as "internal" risks, not subject to reporting.

9.1 RISK MANAGEMENT REQUIREMENTS

a) Contractor shall establish and implement a risk management system to identify, address and manage safety, health and environment, cost, schedule, quality and other execution risks, for the duration of the Work.

b) Contractor's risk management system shall be based on the following principals:
   - All risks shall be identified and captured in the Risk Register (as defined in Section 9.1(c) below);
   - All risk scenarios shall be evaluated for elimination or mitigation through appropriate measures; and
   - All higher and medium risk scenarios and associated risk management strategies shall be communicated and accepted by the appropriate level of Contractor's management.

c) Contractor's risk management system shall include the following features:
   - Contractor shall develop a risk management plan indicating the formal risk process to be followed during Work execution, with risk assessment approach and frequency. The plan shall also include assessments required for safety, health and environment and execution risks referenced elsewhere in this Exhibit 3;
   - Contractor shall develop and maintain a risk register ("Risk Register") to capture all details required to monitor identified risks. The format and content shall be subject agreed to by Contractor and Company. It shall be submitted as part of the Monthly Progress Report, along with other reporting requirements specified within this Exhibit 3;
   - Contractor shall perform risk assessments using qualified and knowledgeable Personnel. Contractor shall consult with Company regarding meeting target levels of safety. Contractor shall also include active involvement of Company's Personnel and external expertise, as appropriate;

- Risk assessments and recommended prevention and/or mitigation measures shall be formally documented in the Risk Register;
- Risk mitigation and prevention strategies for assessed risks in the higher and medium categories are required to be reviewed for acceptability by specified levels of Contractor's and Company's management. These strategies shall be supported by formal actions captured in an action log and be appropriate to the nature and magnitude of the risk, with decisions and updates clearly documented;
- Results of formal risk assessments shall be considered in the preparation or review of emergency response plans and procedures; and
- Follow-up processes to ensure that decisions have been implemented shall be formally documented and maintained in an action log. At a predetermined frequency, compliance reviews shall be undertaken to verify that formal risk assessments and follow-up actions are implemented.

d) Where appropriate, Company shall be invited to observe and/or participate in risk assessments performed by Contractor. Results of risk assessments related to the Work shall be distributed to Company upon completion of any of the assessments included within Contractor's risk management plan.

e) Contractor shall also participate in risk assessments conducted by Company or Company's Other Contractors when these risk assessments relate to activities for which interfaces exist with the Work or where Contractor is involved.

10 ENGINEERING AND TECHNICAL DOCUMENTATION

10.1 INTRODUCTION

This Section sets forth minimum requirements for engineering coordination in support of the Agreement, including Article 3 – Contractor's Work Obligations, and Document No. 505573-0000-37AG-I-0015 -– Directions to Contractors / Supplier Document Requirements for Contractor.

10.2 GENERAL REQUIREMENTS

a) As part of the requirement in Section 2.4 to submit its execution plan for the Work, Contractor shall include a detailed engineering management plan for the first 90 days following the Effective date. This plan will address planning activities, staff, offices and other resource mobilization, software acquisition and schedule development.

b) It is the responsibility of Contractor to maintain an electronic system for monitoring, recording and tracking all revisions and changes to drawings and documentation.

c) Any Documents (as defined in section 10.4 below) which require Approval of any Authority, will be submitted to such Authority by Contractor for Approval, unless otherwise agreed.

d) All applicable Documents shall be marked "Issued for Construction" or similar status, prior to commencement of fabrication, manufacture, construction or installation of the Work.

e) Contractor shall not commence any Work involving permanent installation of any equipment, materials or products until Contractor has submitted to Company and Company has accepted the Health, Safety and Environmental plans required by Article 15 of the Agreement.

10.3 DESIGN CONTROL

Contractor shall establish and implement a system to control Engineering activities in order to ensure achievement of a satisfactory level of quality and compliance with requirements including those of all Authorities and the Agreement.

Contractor's Engineering control activities shall include the following:

a) Implement a system for (internal) discipline checking, including the use of check lists where appropriate, to substantiate compliance with the requirements of Authorities, Agreement requirements and Supplier and Subcontractor requirements. Discipline checks shall be documented and traceable

b) Ensure that all aspects of the design (including Supplier information) are systematically verified

c) Ensure that there is no conflict between documents, and

d) Systematically record, for each revision of all documents, originator, checker, Contractor and approval signatures, and, where required, Company Acceptance or Approval, and to incorporate comments as required during the checking and approval processes.

10.4 COMPANY REVIEW AND APPROVAL OF CONTRACTOR DOCUMENTS

Throughout this Section and elsewhere in the Agreement, wherever there is a stated requirement for Approval or Acceptance by Company of a Contractor drawing, procedure, specification or other documentation **(Document)**, this shall mean:

(a) Contractor shall carry out its internal inter-discipline checking (IDC) to verify the quality of the Document. Contractor will verify product requirements, catalogue numbers and similar data and that Contractor has checked and coordinated each Document with the requirements of the Work and of the Agreement

(b) After Contractor’s IDC, and subject to the Document being free of significant “holds”, Contractor shall issue the Document for Company’s Approval.

(c) Related engineering required to allow Company to review each Document must be made available by Contractor, if not already in Company’s possession.

(d) Contractor shall revise the Document to take account of Company’s comments as part of the Work.

(e) Contractor must get Company’s Approval of the Document before it is issued for implementation.

(f) Company will review and return Documents in accordance with the schedule agreed upon.

(g) Company's review is for conformity to the requirements of the Agreement design concept and for general arrangement only.

(h) Company's review will not relieve Contractor of responsibility for errors or omissions in any Document submitted by Contractor or for meeting all requirements of the Agreement unless Company expressly notes the Acceptance of a deviation on the Document.

(i) Upon Company's request, Contractor will revise and resubmit Documents which Company reasonably rejects as inconsistent with the Agreement unless otherwise directed by Company. Contractor will notify Company in writing of any revisions to the resubmission other than those requested by Company.

(j) Company shall have the right to raise additional comments at any time to address Contractor's errors and omissions and Contractor shall incorporate such comments into the Work.

10.5 TECHNICAL QUERY PROCEDURE

Requests for clarification or guidance related to technical details contained within Company Supplied Data, shall be formally presented by Contractor to Company as a Site Query (SQ). Refer to Section 11 below for details on the use of an SQ.

11 CONSTRUCTION MANAGEMENT

11.1 OBJECTIVES

In executing the Work, Contractor shall assign experienced and qualified project management Personnel and craft workers with demonstrated skills during the field work / construction phase of the Work and provide continuity of such Personnel throughout the execution of the Work;

a) Maintain adequate controls and oversight during the field work / construction phase of the Work to ensure conformance with all requirements of the Agreement;
b) Minimize Work execution risks and risks to Company's assets;
c) Develop adequate contingency and recovery plans to mitigate impacts on schedule of unforeseen events (e.g. weather events); and
d) Provide Worksite(s) that are safe, secure and free of industrial health hazards.

11.2 CONTRACTOR'S DUTIES

With respect to the Work, Contractor shall:

a) Plan and co-ordinate the design, fabrication, transportation, installation, construction and completions of the Work with Company to ensure all interfaces are identified and managed;
b) Identify execution risks and develop mitigation plans and procedures covering all reasonable events during the field work / construction phases;

c) Conduct all engineering for field work, fabrication, transportation, construction and completions as stipulated in the Agreement;
d) Prepare, maintain and implement:
   - emergency preparedness and response procedures;
   - detailed fabrication, construction, transportation and material management plans for major Worksites;
   - security measures at the Worksite; and
   - a health and safety program;
e) Provide all construction and installation equipment, tools and temporary facilities required to perform the Work;
f) Provide Personnel and facilities for all field testing, inspection, supervision and coordination activities associated with the Work;
g) Support Company's construction management activities related to the Work; and

11.3 SITE QUERY (SQ)

The Site Query (SQ) process, as described in this Exhibit 3, shall be used by Contractor to facilitate the timely resolution of minor engineering and construction problems encountered at the Worksites. The SQ is used to formally transmit and co-ordinate technical queries with Company and to document the resolution to the query. Company shall not be involved in answering Site Queries which are entirely within Contractor's own responsibility.
Contractor may raise an SQ (in the form attached as Appendix E - Site query (SQ)) to clarify Technical Requirements which require a formal response. The SQ will include separate sections for Contractor's query and for Company's response. Any relevant documents that might assist those assigned to respond to the query in understanding the issue should be included or referenced with mark-ups as required. Contractor's SQ shall be approved by an appropriate level of authority within Contractor's organization and submitted formally to Company (distribution list to be provided). Contractor shall assign an SQ number based upon the Accepted numbering system which will be provided to the Contractor.

Company shall review the SQ and provide a response within the appropriate section of the SQ. It will be Contractor's responsibility to implement any actions associated with the response. Responses may simply be explanatory in nature and require no additional action. Where appropriate, an SQ response may be accompanied by a Site Instruction (in the form attached as Appendix F - Site Instruction) or an Engineering Change Notice (in the form attached as Appendix G - Engineering Change Notice (ECN)). An SQ will remain open until any associated actions have been completed, to the satisfaction of Company.

Open SQs shall be reviewed at weekly Site meetings in order to resolve all matters relating to their resolution.

11.4 SITE INSTRUCTION (SI)

The Site Instruction (SI) process, as described in this Exhibit 3, shall be used to provide a formal record of an instruction or verbal agreement originated directly at Site from Company to the Contractor.

SIs (in the form attached as Appendix F - Site Instruction) will be provided to address the following items (examples only):

a) Instructions to Contractor related to safety or quality;
b) Confirmation of verbal instructions/notifications;
c) Site administration;
d) Reporting requirements;
e) Work clarification; and
f) Instruction subsequent to a Site Query response.

Open SIs shall be reviewed at weekly meetings in order to resolve all matters relating to their implementation.

11.5 ENGINEERING CHANGE NOTICE (ECN)

The Engineering Change Notice (ECN) process, as described in this Exhibit 3, will be followed by Company to highlight the issuance of any engineering design change to the Contractor whenever:

a) Issued for Construction (IFC) drawings or specifications are revised after their issue to Contractor;
b) New IFC drawings or specifications are issued that are not listed in Exhibit 1 - Scope of Work; and
c) IFC, sketches, documents or any such typical instructions are issued.

Company will generate an ECN, using the form found in Appendix G - Engineering Change Notice (ECN) of this Exhibit 3, to describe and communicate Issued for Construction (IFC) document changes to the Contractor. These changes will be described on the ECN form and accompanied by the associated drawings, specifications, sketches and related documents for implementation by Contractor. Where an ECN is the result of an SQ or a SI, it will reference the relevant document. The ECN will be assigned a unique number by Company for future reference and reporting.

12 INVOICING AND PAYMENT

12.1 OBJECTIVES

Contractor shall submit accurate, complete and detailed invoices that reflect the Work completed by Contractor, in a format that will be established by the Company and with the necessary supporting/verification documentation to enable Company to efficiently attest the invoices and recommend Approval and payment of Contractor's invoices by Company, and all in

accordance with the Articles of the Agreement.

12.2 CONTRACTOR'S DUTIES

a) Contractor shall submit invoices in accordance with the Agreement complete with Company Approved Payment Certificates and all supporting/verification documentation Acceptable to Company.
b) Contractor shall submit to Company, a monthly report that summarizes invoices submitted and payments made, along with applicable dates of both the invoices and the payments and other pertinent information that Company may require.
c) Contractor shall submit to the Company, each month, a cash forecast report by currency for the following three (3) months. This report shall be submitted by the 25th day of every month.

12.3 PROCEDURAL REQUIREMENTS

a) Contractor shall submit to Company one original invoice, along with one (1) PDF copy of the invoice and all required Billing Information.
b) Each invoice is to be organized such that it is easily understood and:
   - contains a clear description of the completed Work being invoiced;
   - the charges can be easily and efficiently verified against the Agreement and the Billing Information; and
   - all charges are clearly cross referenced to the Billing Information.
c) All invoice amounts shall be detailed based on Company's code of accounts.
d) The invoice shall include the following information:
   - Contractor's name, address and tax identification number (HST registration number);
   - Invoice date and invoice number;
   - Agreement number and name;
   - Charges detailed by code of accounts along with cumulative value of all invoices for the Agreement detailed by Company's code of accounts;
   - Adjustments, if any, from prior invoices;
   - Subtotal, tax (HST applicable to the invoice) and total;
   - All invoices shall be in the currencies detailed in Exhibit 2 - Compensation;
   - Complete and accurate supporting documentation, including without limitation Billing Information and any other pertinent information that Company may require to verify completion of the Work, the accuracy of the fees, charges and third party charges; complete with a summary sheet cross referencing all supporting documentation to the charges covered on the invoice;
   - Approved Payment Certificate (in the form as stated in Appendix D - Payment Certificate;
   - If Contractor is a non-resident, in accordance with Exhibit 10 – Declaration of Residency, Contractor shall note on each invoice whether any portion of the Work covered by such invoice was performed inside or outside of Canada for the purposes of Canadian income tax legislation, or such other information requested or required

by Company to properly assess withholding requirements; and

- Where appropriate, Change Order amounts may be shown separately and the invoice will itemize charges associated with each Change Order, including without limitation, a detailed description of each item being invoiced. A copy of the Change Order shall accompany the invoice.

e) Before Company pays an invoice, Company may request clarification or substantiation in relation to any charges on the invoice and Contractor shall promptly comply with any such request. Invoice review meetings (or pre-payment meetings) may be held to agree on charges to be included on an invoice.

f) If an invoice is deemed incorrect by Company, Company is entitled to reject such invoice and shall provide reasons for the rejection.

g) A Final Completion Certificate will be required before final payment will be made. When Contractor believes the requirements of Final Completion have been satisfied, as described in Article 25 of the Agreement, Contractor shall request by Notice a Final Completion Certificate. Such request shall be in the form as contained in Appendix C - Request and Final Completion Certificate.

Invoicing for Change Work

Contractor shall submit separate invoices for Changes, unless Company Accepts otherwise, with the Change Order number and date mentioned on the invoice. Invoicing provisions shall be specified on each Change Order. All Changes shall be subject to the compensation provisions and payment terms set out in Article 12 of the Agreement, Exhibit 2 – Compensation and Exhibit 3.

Contractor will not invoice Company for any amounts which result in the cumulative amount invoiced being greater than the lump sum price indicated on a Change Order.

Under no circumstances will Contractor present invoices for a Change, nor will Company compensate Contractor for any Change, in the absence of a Change Order.

Banking Information

a) Payments of invoices shall, where possible, be made by electronic funds transfer to Contractor's bank account, as specified in writing by Contractor to the Company.

b) Any changes in Contractor's banking information or payment instructions shall be submitted in writing to the Company Representative. The Company shall not be held responsible for errors or delays resulting from incorrect or delayed submission of changes in banking instructions by Contractor.

APPENDIX A

CHANGE REQUEST

Agreement No:		CHR No. (Reference)	
Agreement Title:		Rev. No:	
Company:		CHO No.	
Contractor/Supplier:		Date:	
		Aconex No.	

Description of Change Request and Reason (attach all supporting information):

Supporting information that forms part of this Change Request:

Description of impact on Control Schedule:

Revised Finish Date:

Lump sum price (or estimated cost) and adjustment to the Contract Price:

Item	Description	UOM	QTY	Unit Price	Extended Price
				Value of this Change Request:	$

ORIGINATOR ☐ COMPANY ☐ CONTRACTOR/SUPPLIER

Title	Name	Signature	Date

OTHERS REVIEW

Title	Name	Signature	Date

APPENDIX B

CHANGE ORDER

Agreement No:		CHO No.	
Agreement Title:		Rev. No:	
Company:		CHR No.	
Contractor/Supplier:		Date:	

Description of Change:

Supporting information that forms part of this Change Order:

Change Includes: Adjustment Type:	☐ Price	☐ Schedule	Original Contract Price	
	☐ Lump Sum	☐ Unit Rate	Previous Change Orders Price	
	☐ Fixed Amount	☐ Estimate	This Change Order Price	
	☐ Reimbursable		Total Contract Price to Date	$

Impact on Control Schedule:

Revised Finished Date:

This Change Order shall form and be read and construed as an integral part of the above-noted Agreement. The above adjustment to the Contract Price constitutes full compensation (including all impact costs) to the Contractor/Supplier for the above Change.

REQUEST FOR FINAL COMPLETION CERTIFICATE

REQUEST FOR FINAL COMPLETION CERTIFICATE

Agreement No.: _____

Agreement Title: _____

Contractor: _____

To Engineer:

In accordance with Article 25 of the Agreement, Contractor hereby confirms that it has completed the Work and all the requirements of Final Completion (as described in the Agreement) have been met, all in accordance with the Agreement, excluding its Warranty obligations.

Contractor agrees that, as of the date of its confirmation below, the Contractor waives, remises, releases and discharges the Company of any and all Claims that are known, ought to have been known or discoverable by reasonable means by the Contractor, which Contractor has or may have relating to or arising out of this Agreement and the subject matter of this Agreement, and all facts and circumstances related to the Work, save and except:

a) Only those Claims previously submitted by Contractor in writing and remaining unresolved prior to the date of Contractor's below confirmation, as listed below:

_____

_____;

and

b) The balance of the Contract Price payable, if any, upon the issuance of this Final Completion Certificate.

Contractor Confirmation:

Contractor confirms it has completed the Work in accordance with the above-noted Agreement.

	SDRL Definitions	
A	**A - General**	
A01	Supplier Document Register (SDR)	Supplier Document Register (SDR) – documents list identifying individual document deliverables by purchase order. This register will capture deliverable requirements as agreed by Contractor/Supplier and Company. Contractor/Supplier is responsible to create and approve this document as a revision controlled document.
A02	Control Schedule	As per Exhibit 3 Coordination Procedure
A03	Monthly Risk Reports	Provides a summary of activities carried out by a Contractor/Supplier aimed at addressing selected Risks; The monthly Risk Reports, inclusive of the Risk Register, are part of the subject matter of the Monthly Risk Reviews. The requirements for the Monthly Risk Report and Risk Register are set forth in sections 2.3 and 2.4 of the LCP Risk Management Requirements for Contractors and Suppliers (SLI document # 505573-0000-39RA-I-0002).
A04	Risk Management Plan	Provides a description of the Risk Management Process, organizational context and tools adopted by a Contractor/Supplier. The contractor shall prepare the Risk Management Plan using as guidance section 2.2 of the *LCP Risk Management Requirements for Contractors and Suppliers* (SLI document # 505573-0000-39RA-I-0002).
A05	Unpriced Copies of Major Sub-Supplier Orders	n/a
A06	Monthly Progress Reports	As per Exhibit 3 Coordination Procedure.
A07	Project Execution Plan	As per Exhibit 3 Coordination Procedure.
A08	Permits	Provide copies of all permit documentation, as described in Exhibit 6 (Environmental and Regulatory Compliance Requirements)
A11	Logistics and Transportation Strategy	Provide a logistics and transportation strategy for the Work which shall include proposed transportation modes and preferred carriers or freight forwarders. The following documents shall be taken into consideration when developing the strategy: (SLI document # GP-5500-F-01-E) Documentation, Packaging, Marking, Shipping and Instructions and /or (SLI document # 505573-361C-4ZEG-0001) Documentation, Packaging, Marking, Shipping and Instructions Specific to Transmission Line Components.
A13	Shipping Release Authorization	Include Shipping Bill of Materials, Quality Surveillance Release, and Shipping Release Notice.
A28	Health and Safety Plan	As per Exhibit 5 Health and Safety Requirements.
A34	List of Existing Transmission Lines under similar loading conditions	Supplier shall submit the list of Transmission Lines equipped with the proposed product cable under similar environmental conditions.
A35	Contract Specific Environmental Protection Plan (C-SEPP)	The Contractor shall prepare its C-SEPP using as guidance the *Contract-Specific Environmental Protection Plan* ***template*** (SLI document # 505573-0000-68RA-I-0011, provided in Exhibit 11). The Contractor's C-SEPP shall be based on the following: relevant provisions of the *Project-Wide Environmental Protection Plan* (P-WEPP, SLI Document # 505573-0000-68RA-I-0005, provided in Exhibit 11); the *General Environmental Requirements - Technical Specifications* (included in Exhibit 1); *Environmental and Regulatory Compliance Requirements* (Exhibit 6); the *Waste Management Plan* (SLI document # 505573-0000-68RA-I-0008, included in Exhibit 11); and the *Master Spill Response Plan (Nalcor document # MFA-PT-MD-0000-EV-PL-0001-01, included in Exhibit 11).*
A39	Survey Report	Field Survey Reports. Example: roads, transmission lines, etc.
A40	Monthly Environmental Performance Report	A Monthly Environmental Performance Report shall be submitted by the Contractor, in accordance with provisions of Exhibit 6 (Environmental and Regulatory Compliance Requirements). This report shall include a Monthly Fuel Consumption Report in the format prescribed in Exhibit 6, Appendix C.
A41	Health and Safety Training Records and Certificates	Training records and certificates for employees including, but not limited, to Confined Spaces, Fall Protection, Operator Competencies, Trade Certifications, etc.
A42	Schedule Development and Control Plan	As per Exhibit 3 Coordination Procedure.
A43	Provisional Packing List	A preliminary Packing List listing the items planned to be shipped against the Purchase Order. In addition to the item numbers; tag numbers; planned quantities to be shipped the P/L should also indicate the approximate weights and dimensions.
A44	Control Schedule Baseline Document	As per Exhibit 3 Coordination Procedure.
A99	Miscellaneous General Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
B	**B - ARRANGEMENT DRAWINGS**	
B01	General Arrangements and Layouts	Drawings showing the general arrangement or relative locations of components or construction elements, including overall horizontal dimensions and/or scale bars, noted relative elevations and/or topographic contours, geographic orientations, flow directions, etc. Drawings are normally in horizontal (planar) view, with the location and orientation of elevation views and/or cross-section views shown.

	Nalcor Doc. No.: MFA-SN-CD-2000-ME-LS-0001-01	B2	Date	
	SLI Doc. No.: 505573-3321-45EL-0002	01	22-Jul-2013	

B02	Elevation/Profile Drawings	Drawings showing views of components or construction elements in a vertical plane, i.e. in elevation, for the purpose of showing the vertical arrangement of the components or construction elements, usually with horizontal and vertical dimensions and/or scale bars.
B03	Cross Section Drawings	Drawings showing views of components or construction elements in horizontal or vertical planes which are cut through the assembly of components or construction elements.
B04	Arrangement and Sub Assembly Drawings	Plans and Sections with nomenclature.
B05	Loading Drawings	Foundation drawings, loading requirements and anchor bolts.
B06	Cable Tray Routing Drawings, Layout and Design	Plans , elevations and sections.
B99	Miscellaneous Arrangement Drawings	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
C	**C - DESIGN & OPERATIONAL DRAWINGS**	
C01	Piping and Instrumentation (P&IDs)	P&IDs are a graphical representation of all the process equipment, all the major sections of pipe, motors, all instruments (including control logic depiction) and their interconnection. Each item shown on the P&ID shall be given a unique Tag No. as per the Project approved naming conventions in coordination with the Owner representative. ISA Standards symbology shall be used.
C02	Process Flow Diagrams (PFD)	Diagrams shall be provided for all gas, oil, water, air systems etc. Diagrams shall be drawn using standard symbols and tagging systems adopted for the project as advised by the purchaser and shall include all indication and controls required for safe operation of the equipment, line sizes, line ratings and design pressures and temperatures, all customer connections identified in accordance with “Customer Terminal Point Schedule” - plus part numbers in accordance with “Bill of Materials.
C03	HVac Schematic and Flow Diagrams	Schematics and flow diagrams shall be provided for all heating, ventilating and air conditioning systems. Diagrams shall be drawn using standard symbols and tagging systems adopted for the project as advised by the purchaser and shall include direction of flow and location of system components.
C04	Logic Diagrams	Process Logic shall be detailed. A comprehensive set of SAMA logic diagrams must be produced.
C05	System Schematic Diagrams	Supplier to provide schematics for any systems not covered by P&ID, e.g. hydraulic, pneumatic, cooling.
C06	Sequential and Control Function Charts	A sequential function chart (SFC) provides an overview of system behavior. IT shall describe the start-up, shutdown and other sequential operations. A Continuous Function Chart (CFC) shall address the functions that run regardless of the active sequence. It complements the SFC and both shall be provided.
C07	Functional Description or Process Control Narratives	This document should include a text-based detailed description of the process control. It shall include but not be limited to: descriptives, flags, requests and commands, permissives, modes of operation, description of sequences, loop narratives, start conditions, start actions, run conditions, alarms, interlocks conditions and actions, pause conditions and actions, resume conditions and actions.
C99	Miscellaneous Design & Operational Drawings	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
D	**D – DETAIL DRAWINGS**	
D01	Isometrics-Field Erected H/U Spools Only	Isometric drawings of plant and systems.
D03	Equipment Details	Details of equipment construction, capacity, etc. to meet the Purchaser’s specification.
D04	Fabrication, Installation and Shop Drawings	Drawings to show fully dimensioned component parts of items being supplied. To include Plating Drawings and dimensional drawings for lateral tees.
D06	Foundation Drawings	Provide all drawings associated with foundation details.
D07	Equipment Drawings	To include Rigging / Lifting Plans / Details and or Elevations complete with all necessary dimensions. All relevant notes regarding lifting and installation requirements.
D08	Shipping Drawings	Provide all drawings associated with shipping activities.
D99	Miscellaneous Detail Drawings	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
E	**E – ELECTRICAL/INSTRUMENTATION & INTERCONNECTIONS**	
E01	Interconnection Block Diagrams	An Interconnection Block Diagram shall be provided when Equipment Supplier requires the field contractor to do the field installation or interconnection of devices or panels. The panels/junction boxes/devices Tag number shall be identified as well as any cable included by the supplier.

Lower Churchill Project	Powerhouse and Spillway Hydro-Mechanical Equipment Supplier Document Requirements List (SDRL)	Revision		
	Nalcor Doc. No.: MFA-SN-CD-2000-ME-LS-0001-01	B2	Date	
	SLI Doc. No.: 505573-3321-45EL-0002	01	22-Jul-2013	

E02	Wiring Diagrams/Schematics	Wiring Diagrams shall be produced for each panel, cabinet, rack, console and item of equipment designed and constructed by the Supplier or Sub-Supplier specifically for this order. Diagrams shall indicate in an acceptable "ladder" format and shall be of a "Block" format showing all interconnections within the unit including those to all termination's and external interfaces. The diagram shall be fully detailed showing the details for each cable core and wire and the connections down to the level of interfaces to proprietary items within the unit. All units and connections shall be uniquely identified. All voltage levels, ratings, sizes, manufacturer, type numbers, cable and wire types, sizes, colour and ID number shall be included. All internal cables and wires shall be identified at both ends to a numbering schema agreed between the Purchaser and the Seller. Functional descriptions for each connection or signal path shall be included to enable users to fully comprehend the operation and configuration of the unit. Schematic drawings shall include cable types, cable numbers, tag numbers, termination point (plug/socket etc.), power supply sources, earthing arrangements and location of each item of equipment. The diagram shall also include any notes that may be necessary to enhance the understanding of the system's configuration and operation as well as indicating which components and connections are subject to emergency shutdown arrangements. Equipment and Cables not in the Supplier's scope shall be clearly identified. Schematic diagrams for instrument relay control and trip systems, etc., shall show the electrical arrangement of all component parts. Relays shall be shown with contacts in coil de-energized position.
E03	Single Line Diagrams	An interconnectivity representation of all electrical elements of a system.
E04	Control System Network Diagram	A single line diagram of the data communications system shall be provided. The drawing(s) shall show all the major control system components and how they are interconnected. Addressing information shall be provided at each drop.
E05	Panel and Annunciator Layout Drawings	General arrangement of Panel components complete with identification tags. Include BOM unless being issued as a separate document.
E06	Panel Detail Diagram	Provide details of equipment layout, terminal blocks and wiring schedule.
E07	Instrument Hook-up Details	Provide installation detail drawings for any instrument that requires installation by the field contractor.
E08	Block Diagram	Provide Control System Block diagram showing major system components (complete with tag No. and description) and their interconnection.
E09	Cable Specifications	Provide Technical data and specifications for cables connected to equipment not supplied as part of the scope of the turbine and generator package: cables connecting the line protection panels: control cables between the powerhouse and switchyard used for interlock purposes.
E99	Miscellaneous Electrical/Instrumentation & Interconnections Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
F	**F - DATASHEETS**	
F01	Equipment Data Sheet	Equipment data sheets will be issued by the Purchaser as part of enquiry or purchase order. Supplier to complete.
F02	Motor Data Sheet	Electrical data sheets will be issued as part of the enquiry and purchase requisition, part of the data sheet is completed by the purchaser, the remainder is to be fully completed by the Supplier.
F03	Instrument Data Sheet	An instrument datasheet shall be completed with process information, instrument specification information, materials of construction, process connections, power requirements, instrument and calibrated ranges, signal output, cable entry size, mounting type and any other key information. An instrument supplier datasheet can be provided as long as all other specific information such as manufacturer and model number (complete), calibration ranges and setpoints are included in the instrument index.
F04	WHMIS Material Safety Data Sheet (MSDS)	Supplier must provide suitable and sufficient health and safety information to ensure compliance with the Hazardous Products Act of Canada and any other relevant Provincial or Local legislation.
F05	Mechanical Properties of Materials	When requested Supplier to provide the following mechanical properties: Tensile strength, Yield Strength, Elongation at Ambient Temperature and any other information as requested.
F07	Shipping Bills of Material	Weights and dimensions data for all materials to be shipped.
F99	Miscellaneous Datasheets	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
G	**G - SCHEDULES/LISTS**	
G01	Bill of Materials / Equipment List	Bill of Materials shall list all items in the system by part number, and indicate the major features of each item, e.g. make, model, type, supply voltages, output characteristics, materials, set pressure, design pressure, range, etc. It shall show the total quantity of each item supplied.
G02	Line Lists	Blank line lists will be supplied by the Purchaser for Supplier to indicate all salient features for piping included in his supply.
G03	Cable Schedule	The following information must be included in the cable schedule as a minimum: Cable Tag, a brief technical description of all cables, source, destination. Also a field showing scope of supply (i.e. by supplier, or by others) and scope of installation and termination for each cable (i.e. by supplier or by field contractor). The schedule shall be updated monthly or when significant changes occur. This document will not be approved to final status until the dispatch of all equipment to site after which any changes will be made directly onto the purchasers Master Cable Schedule. The schedule shall be submitted in hard copy and MS Excel format. Samples can be provided upon request.

Lower Churchill Project	Powerhouse and Spillway Hydro-Mechanical Equipment Supplier Document Requirements List (SDRL)	Revision		
	Nalcor Doc. No.: MFA-SN-CD-2000-ME-LS-0001-01	B2	Date	
	SLI Doc. No.: 505573-3321-45EL-0002	01	22-Jul-2013	

G05	Preventative Maintenance Schedule	Section shall include schedule of preventative maintenance tasks/maintenance frequencies, where relevant routine test procedures and inspection instructions are to be provided.
G06	Instrument Index	An instrument list in Excel and hard copy format shall be provided. Each instrument tag number must be listed. The following fields are to be included and completed: Tag number, instrument type description, service, associated equipment, instrument range and calibration range (include calibration range if not provided in datasheets), reference P&ID or schematic if applicable, manufacturer and complete model number.
G07	Alarms and Trip Set Point List	Provide list in excel format and hard copy. Sample can be provided upon request.
G08	Computer Systems Documentation	1. System Description a. Hardware Components b. Operating System c. Driver d. Utilities e. Application Software f. Type of Interface g. Operator's Manual ***2. Hardware*** a. Schematic b. Interconnection diagram, especially special interfaces signal level, type of signal (how one sees it on an oscilloscope) and meaning, especially in relation to diagnostic programs c. Point list, if applicable d. Equipment drawing as provided by Original Equipment Manufacturer (OEM) e. Card drawing as provided by OEM f. Document on any customer modification g. Maintenance manual, with schedule of preventative maintenance h. Material list, with identification of original source of supplier, where practical ***3. Software*** a. Memory map b. Disk map c. Description of all key routines and sub-routines specifically, its function; how parameters are passed to it, where it returns parameters, how routine is activated, priority level constraints on usage, etc. d. source code, laddered diagrams, set points, etc.
G09	Input/Output List	I/O list shall include the corresponding device tag, I/O type and complete hardware and software addresses of each I/O point in the system. Required in Excel format and hard copy. Project sample can be provided upon request.
G99	Miscellaneous Schedule/List Documents	As described in the procurement documents and on SDRL or considered necessary by Supplier.
H	**H - CALCULATIONS**	
H01	Architectural Calculations	Calculations shall be provided for the following, as a minimum : **1**. Noise Design Calculations shall be provided for wall, partition and liner to ensure that noise transfer between areas is below purchasers stated requirements. Noise design calculations shall also be provided for proprietary equipment for areas such as Galleys and Laboratories (any equipment with any moving or mechanical parts). **2**. Thermal Calculations shall determine heat emitted to the atmosphere for project loading and ambient temperatures specified by the purchaser. **3**. Calculations shall also be provided for Structural elements such as Mini modules, blast walls, Firewalls etc. Please refer to Structural calculations for requirements.
H02	Foundation Support Calculations	Calculations shall be provided for the following, as a minimum: • Identification of all applicable loading conditions • Bearing capacity requirements • Beating capacity of the foundation for the applicable loading condition • Anchorage requirements with loads and anchor details.
H03	Structural Calculations	Calculations shall be provided for the following, as a minimum: • Identification of all applicable loading conditions • Loading, bending moment and shear force diagrams for all members, bracings and connections • Member selection details • Weld load and size requirements • Bolt load, size and number requirements
H04	Pressure Vessel / Tank Calculations	Calculation of wall thickness and volume verification for each vessel/tank in accordance with applicable ASME requirements.
H05	Pressure Piping System	Calculation of wall thickness, welds, flanges and instrument connections; dynamic analysis for each pressure line and system of design and extreme operation conditions in accordance with applicable ASME and CSA B51 requirements, including permit requirements.

Lower Churchill Project	Powerhouse and Spillway Hydro-Mechanical Equipment Supplier Document Requirements List (SDRL)	Revision		
	Nalcor Doc. No.: MFA-SN-CD-2000-ME-LS-0001-01	B2	Date	
	SLI Doc. No.: 505573-3321-45EL-0002	01	22-Jul-2013	

H06	Thrust Bearing Loads and Capabilities	Calculations shall be provided for the following, as a minimum: • Hydraulic thrust loads • Structural support and stiffness requirements • Oil film thickness • Friction coefficients and losses • Cooling oil and water flow requirements • Hydrostatic lift system requirements.
H07	Lifting Lug Calculations	As a minimum calculation for lifting lug tension, bearing and shear failure loads; weld loads and size requirements; and specified safety factor to be provided.
H09	Instrument Air or Hydraulic Requirement Calculations	Calculation listing the air or hydraulic consumption requirements for each instrument air or hydraulic user and total air or hydraulic requirements.
H10	Fire Protection System Calculations	Calculations to detail pipe friction losses, nozzle sizes, and discharge rates in accordance with NFPA requirements. i.e.: sprinklers as primary protection.
H12	Mechanical Calculations - Misc.	All other mechanical calculation requirements specified in the contract documents and technical specifications, not already outlined in Attached 5a and 5b of this document, shall be provided.
H13	Electrical Calculation - Misc.	Purchaser will detail these as specifics are prepared. Calculation listing of various equipment rating.
H14	Civil Calculation - Misc.	Civil Calculations shall be provided.
H15	Transmission Line Calculation - Misc.	Any calculations not covered in H52-H58.
H23	Compressed Air Calculation	Calculations listing the compressed air consumption requirements for each instrument air user and total air requirements for both high and low pressure compressed air. In addition to system schematics and flow diagrams, calculations for piping sizes and rating, compressor rating, storage tanks, and expected volumes compensation/leakage air are to be provided for both high and low pressure compressed air systems.
H24	Gate Operating Ring Calculation	Gate operating ring materials and mechanical properties are to be provided. Calculations for the radial and axial displacement as well as maximum and allowable stress under applied load conditions are to be provided.
H25	Turbine Shaft Calculation	As per technical specification
H26	Runner Calculation	As per technical specification
H27	Stay Ring Calculation	As per technical specification
H28	Wicket Gate Calculation	As per technical specification
H29	Shaft Seal Calculation	As per technical specification
H30	Head Cover Calculation	As per technical specification
H31	Penstock Calculation	Not Applicable for Muskrat Falls
H32	Survey Calculation	Calculations shall be provided for the following, as a minimum: • Identification and 3D coordinates of the original site survey control points. • Identification and 3D coordinates of all major control points on the site. • Details layout drawings showing all major control points.
H33	Reinforced and Prestressed Concrete Calculation	Calculations shall be provided for the following, as a minimum: • Identification of all applicable loading conditions • Finite element analyses • Loading, bending moment and shear force diagrams for all components • Locations and jacking loads for pre-stressing tendons
H34	Structure Stability Calculation	Calculations shall be provided for the following, as a minimum: • Identification of all applicable loading conditions • Stability, including overturning and sliding • Location of resultant with respect to mid third of base • Location and size of drainage system components • Stability of excavated surfaces (soil and rock) • Stability of constructed fill slopes • Stability of natural in-situ materials and/or slopes affected by construction or reservoir impoundment, during construction or operation.
H35	Grouting Calculation	Calculations shall be provided for the following, as a minimum: • Definition of grout curtain (Primary, secondary, tertiary), including hole depths • Volume of grout take per hole
H36	Concrete Mix Calculation	Calculations shall be provided for the following, as a minimum: • Mix designs for slush grout and dental concrete for foundation preparation • Mix designs for conventional concrete for each structure, including primary and secondary concrete • Mix design for roller compacted concrete for each structure

Lower Churchill Project	Powerhouse and Spillway Hydro-Mechanical Equipment Supplier Document Requirements List (SDRL)	Revision		
	Nalcor Doc. No.: MFA-SN-CD-2000-ME-LS-0001-01	B2	Date	
	SLI Doc. No.: 505573-3321-45EL-0002	01	22-Jul-2013	

H37	Blasting Calculation	Calculations shall be provided for the following, as a minimum: • Drilling pattern and powder factor for each structure or operation, including: - Size and spacing of holes, and Size and placement of charges, for pre-shearing. - Size and spacing of holes, and Size and placement of charges, for pre-shearing. - Size and spacing of holes, and size and placement of charges, for mass excavation. • Vibration limitations for each structure or operation.
H38	Essential Service Load Calculation	Full report and calculation
H39	Unit Service Load Calculation	Full report and calculation
H40	AC Station Service Load Calculation	Full report and calculation
H41	DC Station Service Load Calculation	Full report and calculation
H42	Primary Grounding Calculation	Full report. Calculations and drawings.
H43	EMTP Study	Full Report
H44	Insulation Coordination Study	Full Report
H45	Exciter Performance & Parameter Study	Full Report
H46	Governor Performance & Parameter Study	Full Report
H47	HVdc Scheme RAM Study	Full Report
H48	Reactive Power Study	Full Report
H49	Resonance Study	Full Report
H50	Sub-Synchronous Resonance Study	Full Report
H51	Relay Setting Calculation	Full Report
H52	Sag and Tension Calculation	All wires. All load cases. Stringing sag charts. Calculations for all load cases.
H53	Electrical Clearance Calculation	All codes as per CSA 22.3
H54	Design Load Cases	All calculations shall include zoning. Including 3 zones for dc, and 1 zone for ac.
H55	Coordination of Strength Calculation	Take into account conductor, tower (suspension, angle, dead-end) foundation, and hardware/insulators.
H56	Aeolian Vibration Calculation	Done by supplier using proprietary software.
H57	Insulation Requirement Calculation	As per CSA 22.3
H58	PLS-CADD Model Input Parameter Calculation	All details including *.bak file.
H59	Critical Speed of Rotating System	As per technical specification
H60	Acceptable Stress Calculations - Extreme Loads	As per technical specification
H61	Extreme Loads - Breaking point of shear pins	As per technical specification
H62	Natural Frequency Analysis	As per technical specification
H63	Fatigue Analysis	As per technical specification
H64	Step-up Calculation Prototype Efficiency	As per technical specification
H65	Current Transformer Design Calculations	As per technical specification including knee point calculations
H66	Creep Correction Chart	Provide Creep Correction Chart for the material.
H99	Miscellaneous Calculations Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
J	**J - PERFORMANCE DATA**	
J01	General Performance Data	This heading to cover any Performance Data required, but not previously covered by Code and Description.
J02	Current and Potential (CT/VT) Transformer Curves	Graph showing current transformer magnetization characteristics.
J04	Compressor Performance Curves	Curves to indicate the discharge pressure, shaft input power, polytropic head and efficiency versus inlet capacity for specified inlet pressure, temperature and molecular weight for each section (casing) and overall unit. Curves shall indicate performance from surge through to 120% rated capacity. Units driven by variable speed drivers shall be provided with curves for 80, 90, 100 and 105% rated speed.
J05	Pump Performance Curves	Curves to indicate differential head developed, efficiency, input power required and NPSHR versus flow for rated impeller. Units driven by variable speed drivers shall indicate four performance curves to indicate performance from minimum to maximum operating speeds. Curves shall indicate performance from zero to 120% rated flow, with minimum continuous flow clearly indicated.

J06	Performance Guarantee	As per technical specification and as follows: Performance guarantees shall be provided for all supplied equipment, ensuring environmental sustainability and safety, with specified performance requirements. Guarantee information to be provided shall include, but is not limited to, the following: • Expected life of equipment/components • Terms of warranty • Rated capacity and efficiency • Minimum hours of operation without failure/defects (e.g. oil leakage, surface cracking, insulation failure, wear rate, etc.) • Acceptable Operation limits (e.g. Operating temperature range, coolant and/or lubricant requirements, vibration limits, operating voltage, etc.)
J07	Miscellaneous Performance Data	As per technical specification
J08	Turbine Efficiency Curves	As per technical specification
J09	Generator Performance Curves	As per technical specification. Diagram showing generator real and reactive power capability.
J10	Soil Graduation Analyses	Standard particle size distribution in table and graph formats.
J11	Optimization Analyses (Civil)	Depending on the type of optimization, one or more of the following are to be provided: • Comparative layouts with tabulated associated relative benefits and costs. • Tables and/or graphs to illustrate the relative benefits and costs to provide the next level or size of installation.
J12	List of Environmental Emission and Effluent	As per Environmental Requirements.
J99	Miscellaneous Performance Data Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
K	**K – PROCEDURES**	
K01	Welding and Weld Repair Procedure	Specification defining all shop and field welding techniques and test results, and in accordance with the requirements of the Purchase Order.
K02	Vibration/Noise Level Test Procedure	Procedures defining extent, method and data to be recorded.
K03	Non-Destructive Test Procedure	Procedures defining extent, method and acceptance levels of all NDT in compliance with Purchaser's requirements, for materials and formed or welded fabrications by visual, radiographic, ultrasonic, magnetic particle, dye penetrant, eddy current or other techniques.
K04	Performance/Acceptance Test Procedure	• Suppliers' procedures for testing to demonstrate compliance with Purchaser's requirements and process guarantees. • Procedures shall indicate test bed arrangements, procedures to be adopted, readings to be taken, instruments to be used, and method of interpreting readings taken to determine basis for acceptance of results.
K05	Heat Treatment Procedure	Suppliers' procedures in accordance with the applicable code/standard and Purchaser's purchase order requirements.
K06	Pressure Test Procedure	Procedures shall indicate test bed arrangement, procedures to be adopted, readings to be taken, instruments to be used, and method of interpreting readings taken to determine basis for acceptance of results.
K07	Factory and Site Test Procedures (FAT/SAT)	• Description of system test procedures for control systems, safety, trip/shutdown systems, electrical and telecommunication systems with typical test record documents. • Factory test procedures are to be produced for use in tests to be conducted at the Supplier's or Sub-Supplier's works for each system. There shall also be an integrated test procedure to test all interfaces and connectivity, i.e. an overall test with all systems fully assembled and interconnected in the factory (including central equipment and a representative number of field equipment's). These tests shall demonstrate complete compliance to the Project Specification within the Purchase Order or Sub-Contract.
K08	Load Test Procedure	Procedure describing the method and extent of testing Cranes, Davits, Lifting Lugs in accordance with specified codes, standards and statutory and mandatory requirements.
K09	Dimensional Inspection Procedure	Dimensional Control Procedure, Visual Inspection Procedure.
K10	Manufacturing/Fabrication Procedure	Procedure explaining methods used to produce the required item(s) stated in the purchase order as detailed by the specification and/or data sheets.
K11	Cable Wiring Procedure	Supplier to supply his standard for approval.
K12	Commissioning Procedures	Commissioning Procedures shall comprise a Mechanical Completion Procedure to verify the integrity of installation works completed by others and Commissioning Procedures, all conducted by the Supplier. Mechanical Completion Procedures shall be produced which verify the mechanical completion for cables, cable termination's and equipment and systems physically installed by others. The procedure shall also certify the integrity of Supplier installed cables and termination's prior to the application of power. Commissioning Procedures shall be produced in accordance with the Project Specification within the Purchase Order or Sub-Contract.

K15	Surface Preparation and Coating Procedure	Painting and/or coating procedures shall be provided for all equipment/components requiring a protective covering. Procedures shall be in compliance with purchaser specifications and industry standards and provided for both factory and site applied paint and coatings. Procedures shall include but not limited to, the following information: • Description of material/components to be covered. • Surface preparation details • MSDS information from paint and/or coating manufacturer • Primer requirements, if applicable • Required number and thickness of painting/coating layers
K16	Instructions for Transportation, Storage, Warehousing and Long term Storage	Provide Full Instructions for transportation, storage, presentation, warehousing and long term storage.
K17	Shaft Inspection Procedure	As per Technical Specification.
K18	Flushing Procedure	As per Technical Specification.
K21	Certified Fusion Splicing Procedure	Fusion splicing shall be carried out by trained personnel.
K22	Routine Test Procedure	Provide a full list of routine tests, which will be carried out during manufacture, as well as the actual procedures and the test equipment that will be used.
K23	Sample Test Procedure	Provide a full list of sample tests, which will be carried out during manufacture, as well as the actual procedures and the test equipment that will be used.
K24	Construction Method Statements and Procedures	Includes all necessary construction method statements and procedures. Site installation and erection procedures shall also be included.
K99	Miscellaneous Procedures Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
L	**L -MAINTENANCE & SPARES**	
L01	Lubricant and Operating Fluids Schedule	Schedule to indicate type and grade of lubricants required for all equipment supplied. For each entry, first-fill capacities, rate of consumption plus frequency of change shall be indicated.
L02	Recommended Commissioning and Start-up Spares	List shall indicate parts recommended by Supplier, and be defined by reference to cross-sectional drawings and relevant parts list. Against each entry, Manufacturer, Manufacturers part no, price and delivery shall be indicated.
L03	Recommended 12 and 24 Months Operation Spares	List shall indicate parts recommended by Supplier and be defined by reference to cross-sectional drawings and relevant parts list. Recommendation shall assume that recommended commissioning spares will be purchased with main equipment. Against each entry, Manufacturer, Manufacturers part no, number of parts in operation, price and delivery shall be indicated.
L04	Recommended Critical Spares (Insurance)	Essential Spares that have a long delivery time and/or require testing with the main equipment. Against each entry, Manufacturer, Manufacturers part no, number of parts in operation, price and delivery shall be indicated.
L05	Special Tools List	List shall indicate those tools necessary for removing equipment from transport at site, plus those necessary for installation and maintenance equipment. Against each entry, a brief description shall be indicated plus, where necessary for clarity, a drawing provided.
L99	Miscellaneous Maintenance & Spares Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
M	**M - TEST & INSPECTION REPORTS**	
M01	Material Test Certificates	Material Test Certification. The level of certification, traceability and marking of materials will be defined within the Purchase order referenced specifications, drawings and data sheets.
M02	Instrument/Electrical Test Report	Heat run, short circuit, etc. test reports
M03	Component/Assembly Balance Certificate	Static and dynamic test results.
M04	Hydrostatic/Pneumatic Test Certificate	Tested to a recognized code or standard. Including marked-up isometrics for pipework defining extent of test.
M05	NDE Test Reports	Detailed NDT reports detailing procedure used, acceptance levels, results obtained and action for radiographic, ultrasonic, magnetic particle dye penetrant and eddy current examinations. Reports shall identify code/standard, components tested, location, operator, date, heat treated condition and weld repairs (as applicable).
M06	Welder Performance Qualifications and Certifications	Qualification of all welder/welding operators using approved weld procedures and by weld position in compliance with the Purchaser's requirements. Code forms or Supplier standard forms to be used as appropriate.
M07	Heat Treatment Records	Fully endorsed certificates of any heat treatment conducted during forming or fabrication such as normalizing, quenching, post weld heat treatment etc. Certificates must be fully traceable for each part by means of serial or unique numbering systems.
M08	Calibration Certificates	Suitably endorsed valid certification to verify that instrumentation has been calibrated by a recognized authority. Where required by the equipment specification, suitably endorsed valid certification shall be supplied for
M09	Fire Testing Certificates	Certification issued by an approved testing establishment or recognized authority for hydrocarbon fires, jet or pool, for the durations stated in the Purchase Order.
M10	Inspection Release Certificate	Fully endorsed certificate issued by Purchaser's inspector.

Lower Churchill Project	Powerhouse and Spillway Hydro-Mechanical Equipment Supplier Document Requirements List (SDRL)	Revision		
	Nalcor Doc. No.: MFA-SN-CD-2000-ME-LS-0001-01	B2	Date	
	SLI Doc. No.: 505573-3321-45EL-0002	01	22-Jul-2013	

M11	Code Compliance Certificate	The Certificate should be issued by the IIA, and document that all Pressure Vessels have been designed in accordance with the nominated code or standard, and that the review considered the specified design conditions, nozzle and environmental loadings.
M12	Lifting Equipment Test Certificate	Required for all items, hoists, cranes wire ropes/shackles, padeyes, etc.
M13	Noise Test Certificate/Reports	In compliance with the Project Specification within the Purchase Order.
M14	Vibration Test Certificate/Reports	In compliance with the Project Specification within the Purchase Order.
M15	Performance Test Certificate	Suppliers report on performance testing of equipment, including overspeed tests with the copies of data, indicating that equipment complies with Purchaser's specification.
M16	Painting/Coating Test Report	As required by the Project Painting and Coating Standards.
M17	Steel Manufacturing Reports	Residual magnetism report, heat treatment report, mechanical test reports, full traceability cross-reference control sheet.
M18	Mechanical Run Test Report	The mechanical run test report shall include details and result of the successfully completed FAT of equipment and systems as well as the details and results of the successfully completed commissioning static checks and dynamic commissioning/system commissioning tests completed after equipment and systems are assembled and installed at site.
M19	Factory and Site Test Report (FAT/SAT)	Full test report for each test as per K07.
M20	Commissioning Report	Full test report for each test as per K12.
M21	Efficiency Test Reports	• Full test report and calculations. • Full test report shall be provided detailing the measured actual efficiency of equipment and systems including turbine, generator, governor, auxiliary equipment, etc., after assembly, installation and commissioning at site and Turnover to Operations.
M24	Manufacturer's Type Test List and Report	Proof of design and type tests previously performed on the material shall be submitted for approval.
M25	Reports and Certificates for Routine Tests	Provide Routine test reports with certificates before and after stranding.
M26	Reports for Sample Tests	Provide sample test reports
M27	Mechanical Completion Report	Provide as per K12.
M28	Certificate of Origin	A document required from the Exporter (or its agent) and certified by an issuing body, that the goods in a particular export shipment have been wholly produced, manufactured or processed in a particular country. The Certificate of Origin must be signed by the Exporter and, in many countries, validated by a Chamber of Commerce.
M29	Preservation Records	Preservation records that shows compliance to storage requirements
M99	Miscellaneous Test & Inspection Reports	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.
Q	**Q – QUALITY**	
Q01	Quality Assurance System Registration Certificate	Certificate provided by an authorized registrar confirming conformance to a quality management system.
Q02	Quality Assurance System Manual	Document specifying the quality management system of an organization.
Q03	Quality Plan	Document specifying which procedures and associated resources shall be applied by whom and when to a specific project, product, process or contract.
Q04	Inspection and Test Plan(s) (Factory and Site works)	Document defining the inspection and test activities to be carried out during the realization of a product.
Q05	Certificates of Conformity (Factory and Site Works)	Certificates authorized by the supplied or third party verification body attesting that the product meets requirements.
Q06	List of Generator Tests	Provide list of all generator tests to be performed during manufacturing, installation and commissioning.
Q07	Internal/External Audit Schedule	Documented audit schedule for both internal and external (supplier and third party) audits.
Q08	Management Review of Meeting Minutes	Minutes of meeting of the most recent management review of the quality management system.
Q09	Third Party Surveillance Report	Report by an authorized third party on the audit of the ISO 9001:2008 quality management system.
Q10	NCR Register and associated close out reports	Register of Nonconformities reported and associated close out reports.
Q11	Quality Management Certificate for Manufacturer	Supplier shall submit their manufacturer's ISO 9001:2008 or internationally recognized Quality Management Certificate or quality manual.
Q12	Declaration of Installation and Inspection Completion	As per Quality requirements.
Q13	Authorized Deviations	Site queries, concession requests etc. as approved by Purchaser.
Q99	Miscellaneous Quality Documents	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.

R	R – MANUALS	
R01	Installation, Commissioning, Operating and Maintenance Manual	**1. Installation** Section shall include all erection/assembly drawings, instructions as to the use of special tools provided, tolerances allowed on setting dimensions, handling and unpacking instructions. Also includes quantities of preservatives and fluids required for shipment. **2. Commissioning** Sectional shall include list of spare parts, special tools and utilities required, pre-commissioning checks to be performed, sequenced procedure for dynamic commissioning and start-up and fault finding guidelines. Copies of all relevant drawings shall be included. **3. Operating** Section shall include description of equipment, operating procedures for start-up, steady state, shutdown, emergency and fault conditions, operating parameters, function of protective devices and controls, copies of all relevant cause and effect charts and block diagrams, and fault finding guidelines. **4. Maintenance** Section shall include instructions for maintenance disassembly, repair/overhaul and reassemble, schedule of preventative maintenance/maintenance frequencies.
R02	Manufacturing Records Book (MRB)	Construction, manufacturing, installation, testing, reporting and certification documentation required to demonstrate that constructions, equipment, materials and fabricated systems and units are in compliance with he statutory regulations and specified requirements.
R03	Installation, Commissioning, Operating and Maintenance Manual Table of Contents (TOC)	Table of Contents template for the Installation, Commissioning and Operation Manuals
R04	Manufacturing Records Book (MRB) Table of Contents (TOC)	Table of Contents template for the Manufacturing Record Book
R05	Dispatch Dossier	Dispatch Dossier shall mean all those documents required, as a minimum to accompany goods released to site from Contractors/Suppliers and Fabricators. Procured goods shall not be dispatched without Dispatch Dossier.
R99	Miscellaneous Manuals	As described in the procurement documents and on SDRL or considered necessary by Vender/Supplier.

Legend

Column	Title	Description
1	SDRL Code	Document code identifying a type of document required. Supplier may have multiple documents with the same SDRL code, if so these will be identified by unique sequential number on the Supplier Document Register.
2	Type of Document	Short description of SDRL code. Refer to SDR descriptions for detail.
3	Provide With Proposal	Document is required with the proposal.
4	Submit Prior to start of Fabrication / Construction	Document is required to be submitted prior to start of fabrication or construction
5	After Shipment	Not used
6	With Shipment	Hardcopy of document must accompany the shipment (Typically unpacking and erection procedures etc.)
7	Minimum Documents Approved Code 1 Prior to Inspection Release	Document must be approved code one (1) prior to inspection release. Defines a minimum requirement. Additional requirements may be identified through Inspection and Test Plans.
8	As Built	"As Built" revision of the document must be submitted
9	Final Documentation Location (R01/R02)	The final version of all technical documents must be compiled in a manual and submitted. This column identifies which Manual the document will be located in: "R01" Installation , Commissioning , Operating and Maintenance Manual or "R02" Manufacturing Record Book
10	Final File Format	An electronic copy of all files must be submitted. This column defines the file type by its standard 3 letter extension (PDF. DWG, etc.) Further description will be provided in the notes if required.
11	First Submission	The required first submission date for the document after the order has been received. This is defined by a number of weeks relative to an event. Typical events are: ARO = After Receipt of Order FAT = Factory Acceptance Test SHIP = Shipment from Supplie
12	Submit Monthly	Identifies periodic reports and schedule to be submitted monthly after first submission.
13	Notes	Additional explanation or instructions as required.

EXHIBIT 5

HEALTH AND SAFETY REQUIREMENTS

1.0 Introduction

Without limiting the generality and application of the Agreement, Contractor will abide by and ensure Contractor Group Personnel abides by, at a minimum, the health and safety requirements set forth herein and as described in the most recent version of the following documents located in Exhibit 11 – Company Supplied Documents:

- LCP Health and Safety Management Plan (LCP-SN-CD-0000-HS-PL-0001-01)
- LCP Security Management Plan (LCP-PT-MD-0000-HS-PL-0005-01)
- Standard for Drug and Alcohol (LCP-PT-MD-0000-LR-SD-0001-01)
- Global Power Health and Safety Management System (LCP-PT-MD-0000-HS-PL-0006-01)
- Global Power Health and Safety Standards Manual (LCP-PT-MD-0000-HS-SD-0002-01)
- Critical Risk Control Protocols (LCP-PT-MD-0000-RI-SD-0001-01)

2.0 Health and Safety Commitment

Contractor will demonstrate a strong commitment to health and safety management and must operate and ensure that Contractor Group operates a health and safety management system that is compliant with OSHAS 18001:2007, corresponding Canadian standards and fulfills all Applicable Laws pertaining to the Work and Worksites.

Contractor will place the highest priority on safety and health while performing the Work. Contractor is responsible for maintaining a safe working environment at all time at the Worksite whether of a temporary or permanent nature. The system in place will cater to specific requirements for instruction, supervision and resources pertaining to Contractor's Personnel, and Engineer's and Company's Personnel.

Contractor will not permit nor tolerate any unsafe or unhealthy condition or activity over which it has control. Contractor will immediately inform Engineer of any unsafe or unhealthy condition or work practice of which it becomes aware but over which it has no authority to correct.

3.0 Compliance with Health and Safety Regulations and Standards

Contractor will be responsible for complying with all Applicable Laws relating to health and safety, and for taking all necessary safety precautions related to or arising out of the performance of the Agreement in order to protect the Work, Contractor's Personnel, and Engineer's and Company's Personnel, the general public, all other persons, the property of Company, and the property of third parties.

Without prejudice to Contractor's general and legal responsibility for the safety of its operations and of the Personnel and property involved, where Engineer has notified

Contractor of any specific health, safety or environmental requirements, which are applicable to any part of the Work being performed, Contractor will comply therewith.

4.0 General Requirements

Without limitation to the full implementation of Contractor's health and safety management system for the Work, Contractor will:

a) Be responsible for maintaining and enhancing the health and safety awareness of Contractor's Personnel. Contractor will arrange and participate in regular meetings with Contractor's Personnel and Engineer to review implementation of the systems and processes required for Contractor to meet its health and safety obligations in the execution of the Work;

b) Identify all high risk activities and cease work in any identified areas until adequate and effective controls are implemented;

c) Require all Contractor's Personnel to wear personal protective equipment (PPE) and clothing suitable for existing Work in compliance with the Applicable Laws in the locations the Work is being performed. Canadian Safety Association (CSA) standards for PPE will apply to Work performed in Canada;

d) Provide specific instruction to Contractor Group on their responsibilities for safe work during normal and emergency operations, including explanation of recognized hazards and associated protective measures, procedures and emergency response measures;

e) Ensure that each of Contractor's Personnel, regardless of prior experience, demonstrates competency to Engineer in his/her job. The Contractor Group's supervisory Personnel will observe new Personnel's work performance until Engineer is satisfied that such Personnel are competent to fill the position in a safe and effective manner;

f) Ensure that all Contractor's equipment, facilities, materials and Contractor's Items are maintained in safe, sound and proper condition, meet all applicable industry standards and Applicable Laws and are capable of performing the function intended;

g) Conduct thorough drills, desktop exercises and tests of Contractor's Items, Personnel and procedures. The Contractor will ensure the effectiveness, suitability and adequacy of the emergency response and preparedness program;

h) Document and instruct Personnel on work procedures, safe practices, Contractor's safety rules and standards, emergency plans and duties, and Applicable Laws;

i) Conduct scheduled and impromptu safety meetings of all Personnel performing the Work, including any Contractor's Personnel, in which the possible hazards, problems of the job, and related safe practices are emphasized and discussed;

j) Practice good housekeeping standards;

k) Provide general safety education through training, safety meetings, Company and Engineer publications and other educational media;

l) Establish and support a health and safety committee in accordance with Applicable Laws;

m) Provide all reasonable means to control and prevent fires and explosions, injury to Personnel and damage to equipment and property;

n) Institute a permit to work system for hot and cold work, for all Work involving welding, energized equipment, cutting and burning, open flame, electric tools, grinding and soldering which is conducted outside a designated safe area. Contractor will ensure that gas bottles for cutting and burning are stored, separated and capped in accordance with Applicable Laws;

o) Institute a confined space entry procedure and provide training for Personnel involved in confined space entry;

p) Institute a lock out - tag out procedure for all work on equipment, which may inadvertently operate during installation, repair or maintenance, all in accordance with Contractor's permit to work system;

q) Institute a pre-work inspection program prior to commencement of Work. Contractor will inspect and perform task analysis to ascertain whether any health or safety hazards exist. Contractor will correct identified hazards before commencement of Work or will take steps to prevent exposure of Personnel to the hazard. Contractor will document this inspection and hazard analysis process and maintain a copy of the document on file;

r) Institute a program to ensure Contractor's Personnel are fully trained and currently qualified for their jobs in accordance with regulatory and industry standards and all Applicable Laws, and as otherwise specified in this Agreement. Records of certification and training will be maintained for each of Contractor's Personnel;

s) Maintain a register of all lifting equipment. All lifting and rigging equipment will be load tested as per manufacturer's recommendations and be fully certified with suitable inspection procedures in place. All Personnel involved in lifting and rigging activities will be suitably trained and certified. All lifting and rigging equipment must be inspected annually by a certified inspection company and certificate issued and maintained on site.

t) Operate and use all pressure vessels in accordance with local safety requirements and Applicable Laws;

u) Maintain a current inventory of hazardous materials and ensure compliance with Applicable Laws pertaining to their transportation, storage, use, handling and disposal;

v) Ensure compliance with current occupational exposure limits for physical, chemical, or biological agents or materials, in accordance with Applicable Laws;

w) Implement and maintain a planned maintenance system for its tools, equipment, machinery and electrical systems for Contractor's Personnel;

x) Provide Engineer with the results of any health and safety visits, audits, inspections, investigations, surveys, tests or measurements, associated with the Work, conducted by an Authority;

y) Provide signage, as appropriate, to warn Personnel of hazards and indicate areas where the use of additional personal protective equipment is required;

z) Provide and maintain proper barriers, safe access and egress, guards, rails and safety devices to minimize hazards during the performance of Work;

aa) Ensure all inboard and over-the-side scaffolding and work platforms are installed, tested and certified by competent Personnel, prior to use;

bb) Perform planned health and safety audits and inspections of the Worksites, work practices and HS management system in accordance with the audit and inspection schedule outlined in the Contractor's Health and Safety Plan (as described in Section 5 of this Exhibit 5);

cc) Conduct a risk assessment of its operations and provide Engineer with a copy of the assessment, outlining measures to be taken and schedule for implementation of those measures required to address identified hazards. The risk assessment will include consideration of health and safety risks;

dd) Ensure that all Personnel engaged in the Work are medically fit and maintain high standards of hygiene;

ee) Ensure that all firefighting equipment is maintained and operational in accordance with CSA standards and firefighting Personnel are well trained and competent in firefighting;

ff) Set out a communications scheme identifying lines of reporting and method of reporting, both within the Contractor's own organization and to Engineer;

gg) Not cause, permit, or tolerate a hazardous, unsafe, unhealthy condition or activity over which it has control, to exist or be conducted in a Worksite; and

hh) Prior to providing access to a Worksite, provide all Personnel with a Worksite orientation which will include:

i. Worker's rights;
ii. Contractor health and safety policy;
iii. Contractor environmental policy;
iv. Safe work practices and procedures;
v. Reporting of incidents and accidents;
vi. Emergency response;
vii. Personal protective equipment;
viii. Risk assessment; and
ix. Hazard identification.

5.0 Contractor's Health and Safety Plan

Within fourteen (14) days of the Effective Date, Contractor shall submit to Engineer for Approval, a Health and Safety Plan for the Work. Contractor's Health and Safety Plan will be based upon the Contractor's health and safety management system and will address all requirements stated in this Exhibit 5.

Engineer will review Contractor's Health and Safety Plan and may provide written comments to Contractor. Contractor will review Engineer's comments, make the necessary changes and reissue it for Engineer's Approval. Contractor will present all changes to its Health and Safety Plan to Engineer for Approval.

As a minimum, the following information will be included in the Contractor's Health and Safety Plan:

a) Communication of safety expectations to Contractor Group;
b) Identification of the strategic initiatives that Contractor will utilize during the Work to achieve an injury and illness free workplace;
c) A verification/audit program to verify that the Health and Safety Plan has been implemented for the Work;
d) An LCP level safety organization chart;
e) Line functions with specific safety responsibilities;
f) High level, Work specific roles and responsibilities for Contractor's Personnel, including accountabilities and qualifications;
g) Interface roles and responsibilities between Contractor and all other members of Contractor Group by use of responsibility-assignment matrices;
h) Description of how Contractor's management team will actively participate in health and safety management activities;
i) Subcontractor selection and management;
j) Be structured in accordance with the various elements associated with the Work such as fabrication, transportation, installation and commissioning;
k) Identification of Contractor's resources (Personnel, Contractor's Items, facilities, equipment, consumables, or other requirements) required to support health and safety management;
l) A description of the system in place to ensure that the safety integrity of equipment and systems involved is maintained throughout the Work;
m) Identification of procedures applicable to individual activities comprising the Work, including chemical handling procedures and permits to work;
n) Identification of training and qualification requirements pertaining to Personnel involved in the Work, including all location specific training;
o) Outline of a process for maintaining a hazard register, which identifies significant hazards to the safety and health of all Personnel, the safety of the environment and the safety of the technical assets. The register will include a cross reference to the operating procedures in place to control the risk arising from individual hazards;
p) Identification of interfaces to Company's and Engineer's health and safety management systems in line with the Work;
q) An emergency response preparedness plan in line with Contractor's scope of the Work and which interfaces with Company's and Engineer's emergency response plan;
r) Processes that will be utilized by Contractor during the Work to eliminate or control identified hazards;
s) Any other elements as identified in Company's and Engineer's health and safety standards;
t) Identification of how Contractor will capture learning and best practice during the Work execution;
u) Inclusion of a measureable health and safety targets for both leading and lagging indicators that are in line with Company's targets. Performance measuring will include lost time injury frequency rate, all-injury frequency rate, and severity rate; and

v) Identification of how Contractor will measure, assimilate, and report health and safety performance to Engineer.

Contractor's Health and Safety Plan shall:

- take into consideration the hazards and risks that all of Contractor's Personnel are exposed to while working at the Site;
- be communicated to Contractor's Personnel prior to the commencement of Work at the Site; and
- meet all Applicable Laws.

Contractor shall comply with its Health and Safety Plan.

Contractor is responsible for implementing, resourcing, and periodically verifying its Health and Safety Plan. Contractor will provide Engineer with an implementation schedule for its Health and Safety Plan, along with an update to the Health and Safety Plan on a quarterly basis.

Contractor will participate in a health and safety management system interface process and will be in a position to demonstrate through a gap analysis that Contractor's Health and Safety Plan complies with the requirement outlined herein and the most recent version of the following documents as amended from time to time:

- LCP Health and Safety Management Plan (LCP-SN-CD-0000-HS-PL-0001-01)
- LCP Security Management Plan (LCP-PT-MD-0000-HS-PL-0005-01)
- Standard for Drug and Alcohol (LCP-PT-MD-0000-LR-SD-0001-01)
- Global Power Health and Safety Management System (LCP-PT-MD-0000-HS-PL-0006-01)
- Global Power Health and Safety Standards Manual (LCP-PT-MD-0000-HS-SD-0002-01)
- Critical Risk Control Protocols (LCP-PT-MD-0000-RI-SD-0001-01)

Any deficiencies identified as a result of the gap analysis will be corrected by Contractor unless otherwise agreed in writing with Engineer. Contractor acknowledges that it fully understands all interfaces between Contractor's Health and Safety Plan and Company's and Engineer's health and safety standards.

6.0 Engineer's Review of Contractor's Health and Safety Plan

Without relieving Contractor of its responsibilities under the Agreement, Contractor will allow Engineer access to facilities, Personnel and records, when requested, to enable Company to:

a) ensure that Contractor is carrying out its health and safety responsibilities under this Agreement;

b) ensure that Contractor is carrying out its responsibilities outlined in its Health and Safety Plan; and

c) conduct, if required, independent investigation into any health, safety or environmental incident arising in the performance of the Agreement.

The forgoing will also be applicable to all other members of Contractor Group.

If Engineer is made aware of a failure of Contractor to comply with its responsibilities under this Agreement, which does not create an imminently unsafe condition, Engineer will have the right to notify Contractor of such failure and to direct Contractor to abate such condition as soon as possible. If Contractor fails to comply within a reasonable period, then Engineer will have the right to stop all Work being performed by Contractor and the Work will not be restarted until Contractor has abated the failure to comply. Contractor shall not be entitled to compensation for any costs it incurs as a result of such Work stoppage.

7.0 Contractor's Health and Safety Personnel

Contractor shall provide full time, designated health and safety advisor(s) who will be responsible for attending safety meetings, conducting incident investigations, providing health and safety support to all Personnel engaged in the Work and the implementation, maintenance and monitoring safety guidelines and procedures. Contractor will ensure that the safety advisor is a Certified Registered Safety Professional or has equivalent training and experience.

Contractor will require Engineer's Approval of all health and safety Personnel that are proposed to be based at the Worksites.

8.0 Drug and Alcohol Policy

The use, possession, distribution or sale of alcohol, illegal drugs or drug-related paraphernalia, firearms, explosives, weapons or other dangerous substances or articles is not permitted at the Site.

Contractor will submit to Engineer, for Engineer's Approval, Contractor's drug and alcohol policy, which will be in accordance with Applicable Laws. Contractor will ensure that Contractor's Personnel, engaged in the Work at the Site, comply with Company's drug and alcohol policy, Standard for Drug and Alcohol (LCP-PT-MD-0000-LR-SD-0001-01).

Engineer may, if it has reasonable cause to believe that any of Contractor's Personnel is under the influence of alcohol or drugs, require such Personnel be tested in accordance with Company's Standard for Drug and Alcohol (LCP-PT-MD-0000-LR-SD-0001-01) or require Personnel to be removed from the Site and denied further access.

9.0 Reporting

Contractor will provide immediate notification in writing to Engineer of all incidents, including lost time injuries, restricted work cases, medical aids, property damages and near misses. Contractor will immediately complete an investigation into the incident. Incident investigation reports will be submitted to Engineer within seven (7) Business Days after the incident. Contractor's incident investigation report will verify that the incident has been fully investigated and that the root cause and contributing factors have been identified and communicated to the appropriate Personnel. Contractor will also provide Engineer with copies of all reports or other documents filed or provided by Contractor's insurers and Authorities in connection with such incidents.

Contractor will provide Engineer with a monthly safety performance report, which at a minimum, will include all of the following:

a) Lost time Injuries
b) Restricted work cases
c) Medical aids
d) First aids
e) Occupational illness
f) Property damage
g) Recordable injuries
h) Near miss incidents

Contractor will classify all incidents in accordance with the Canadian Electrical Association (CEA) Standard A-2-2007. In general terms, the following is the classification scheme for all injury types:

a) Lost time injury is defined as a work related injury for which an employee requires medical attention and is unable to return to work for his/her next scheduled shift.
b) Medical treatment injury is defined as a work related injury for which an employee requires medical attention; however, s/he is able to return to work for the next scheduled shift.
c) First aid injury is defined as a work related injury, which is minor in nature and can be treated at the Worksite.

The general decision-making process for injury classification typically consists of the following five (5) steps:

a) Determine whether a case occurred; that is, whether there was a death, illness, or an injury;
b) Establish that the case was work related or resulted from an event or exposure in the work environment;
c) Decide whether the case is an injury or an illness;
d) If the case is an illness, record it;
e) If the case is an injury, decide if it is recordable based on a finding of medical treatment, loss of consciousness, restriction of work or motion or transfer to another job.

Injury and illness will be classified in accordance to CEA Standard A-2-2007. Generally, a recordable injury is any occupational injury or illness that results in an individual experiencing:

a) fatality;
b) lost time injury;
c) medical treatment injury; or
d) Other injury/illness (not captured above), which has restricted work; or significant occupational injury/illness; or loss of consciousness.

Each injury or illness should be recorded only once and categorized using the above hierarchy. To illustrate, a lost time injury that involves medical treatment injury and subsequent restricted work will be categorized as a lost time injury.

For work-related injury/illness where the signs and symptoms recur or continue in the absence of an exposure to the workplace, the incident is recurred and does not precipitate a new incident.

EXHIBIT 6

ENVIRONMENTAL AND REGULATORY COMPLIANCE REQUIREMENTS

1 INTRODUCTION

This Exhibit 6 - Environmental and Regulatory Compliance Requirements specifies the Contractor's responsibilities with respect to compliance with Applicable Laws during construction activities at the LCP.

1. The Contractor shall demonstrate a strong commitment to environmental management and must operate, and ensure that all members of the Contractor Group operate in accordance with Canadian standards and fulfill all Applicable Laws, including regulatory requirements, pertaining to the Work and Worksites.

2. The Contractor shall place high priority on environmental protection while performing Work and is responsible for maintaining an environmentally compliant Worksite at all times whether the Work is temporary or permanent.

3. The Contractor shall not cause, permit nor tolerate an environmentally non-compliant condition or activity over which it has control. The Contractor shall immediately inform the Engineer of any environmentally non-compliant condition or work practice of which it becomes aware but over which it has no authority to correct.

2 CONTRACTOR'S RESPONSIBILITIES - REGULATORY AGENCIES

2.1 General

1. The Contractor shall ensure Work areas are available for inspection by the Authorities. All inspections, other than by the Engineer or Company Representative, will be arranged in advance through the Engineer.

2. Any violations of environmental permits or authorizations, or any environmental related incidents observed by inspectors representing Authorities, are to be reported to the Engineer prior to leaving the Site. Except in emergencies, environmental protection measures required by Authorities shall be subject to the Acceptance of Engineer prior to implementation.

3. The Contractor shall ensure that Contractor's Personnel, including machinery and equipment operators and truckers, comply with (a) the terms and conditions of the Agreement, (b) all environmental Applicable Laws and applicable permits, (c) requirements of Authorities, and (d) such other rules and regulations as the Engineer may establish and notify the Contractor.

4. Contractor shall ensure that all members of the Contractor Group shall not harass wildlife or waterfowl or unduly disturb fish. Hunting and fishing are not permitted on the Site. Any contravention of environmental requirements, including employee actions accidental or otherwise, resulting in environmental damage shall be reported to the Engineer without delay.

5. In accordance with the Agreement, the Contractor shall be responsible for customs clearance, import permits, Work validations, Work permits and operating licenses in the port of mobilization / demobilization of the Work, and other requirements that are essential to the Work during all phases of the Work.

2.2 Permits

1. The Contractor shall review the Work to identify all permits, authorizations and certificates that are required for all the Contractor's facilities and the Work. Within the time specified in Section 3.1 below, Contractor shall provide to the Engineer a permit list (containing all such identified permits, authorizations, and certificates), to be entered into a permit registry on Aconex. Once entered, the Engineer shall have the authority to assign to either the Contractor or the Engineer the responsibility for preparing the permit applications.

2. Appendix A - List of Permits, Acceptances and Authorizations provides a list of permits that may be required to undertake the Work and responsibility for completing permit applications. This is a preliminary list and the Contractor shall complete its own list and submit it to the Engineer for Acceptance. In addition, the responsibility outlined on this list may be changed by written intructions from the Engineer to the Contractor due to changes in the Work or schedule constraints.

3. For those permits identified as the responsibility of the Contractor, the Contractor shall identify and prepare applications for all authorizations, permits, dispensations, consents and licenses required by Applicable Laws to enable it to perform the Work. All permit applications identified as the responsibility of the Contractor shall be submitted to the Engineer for internal review a minimum of 3 weeks prior to the date that such authorization, permit, dispensation, consent or license is submitted to the Authority. The Engineer will then submit the permit to the applicable Authority, on behalf of the Contractor. The Engineer will obtain the permit, and forward a copy to the Contractor immediately upon receipt and before the Contractor's facilities are used or the Work is undertaken. The Contractor shall ensure that it receives a copy of the permit and complies with the permit conditions.

   For Service NL building permits, the Contractor shall submit electronically one application package for each building on Site. Such package will include:

   - The fire and life safety review application and the Building Accessibility/Exemption application together as one PDF;
   - All electrical and mechanical permits associated with each building;
   - Any other required approval for buildings/utilities; and
   - The related drawings for the building in a separate PDF document. This PDF shall be created from the full size auto cad drawings.

4. For those permits identified as the responsibility of the Engineer, the Contractor shall

provide information as required in a timely manner to complete the relevant applications. The Contractor shall ensure that permits designated as the responsibility of the Engineer that are required for the Work are in place prior to starting the Work.

5. It should be noted that some authorizations associated with the LCP are subject to an aboriginal consultation process. This process requires that permit applications are provided to relevant aboriginal organizations by the associated Authority for a period of at least 30 days.

6. The Contractor shall take into consideration all these additional reviews and approvals, and the associated timelines, and ensure applications are prepared with the incorporation of these timelines.

7. For permits already in place for existing facilities and permits that the Contractor holds to carry out its business and daily activities, the Contractor must provide a copy of these permits to the Engineer prior to the start of the Work.

8. The *Storage and Handling of Gasoline and Associated Products Regulations, 2003* (referred to as the "GAP Regulations") under the *Environmental Protection Act* of Newfoundland and Labrador applies to the construction, operation and registration of "storage tank systems"[1] in the Province of Newfoundland and Labrador. While Section 3 of the GAP Regulations explicitly exempts storage tank systems of capacity of 2500 litres or less that are connected to a heating appliance (e.g. tanks controlled by the *Heating Oil Storage Tank System Regulations, 2003* of Newfoundland and Labrador), all other "stationary" tanks (i.e. tanks installed in a fixed location) may be interpreted as falling under the control of these regulations. Following this strict interpretation, even very small tanks (e.g. less than 5 litre tanks connected to small generators, water pumps, etc. installed in temporary locations) may fall under control of the GAP Regulations.

   Contractor shall provide Notice to Engineer of any and all storage tanks, storage tank systems and equipment storage tanks proposed by Contractor for use on the Site at least one (1) week prior to such use, along with all information pertaining to such tanks and systems as required by Engineer. If requested by Engineer, Contractor shall obtain written dispensation from the application of the GAP Regulations from the applicable Authority prior to such use of tanks or systems that are not already registered under GAP Regulations. Any required tank or system registration must be accompanied by any necessary regulatory variances.

   In general, the GAP Regulations apply to all stationary storage tanks and storage tank systems except in the following cases:

[1] The GAP Regulations defines "storage tank system" as an "… atmospheric or low pressure closed tank container and all vents, fill and withdrawal piping associated with it installed in a fixed location and includes temporary arrangement on cradles and skids".

- Tanks with capacities of 2,500 liters or less that are connected to a heating appliance;
- Tanks that are designed, constructed and utilized in the inherent operation of a piece of equipment. In this case, the tanks must be physically secured and dedicated to the equipment requiring the fuel for its operation; and
- "Mobile" tanks (e.g. tank trucks and tank truck trailers) used for temporary, stationary storage. In this case, storage period must not exceed 14 days and no additional fuel can be added to the tank. There must also be a minimum of 14 days of downtime between separate storage periods and there can be no more than two 14-day storage periods within a 12 month time frame.

Note that all provisions of the GAP Regulations, including registration, apply for all tanks associated with mobile generators.

Notwithstanding the above provisions of this Section 2.2.8, Contractor shall be solely responsible to comply with all Applicable Laws relating to the Work, and nothing in this Section 2.2.8 shall be construed so as to restrict, limit, waive or otherwise diminish Contractor's responsibility and liability to comply with all such Applicable Laws.

3 CONTRACT-SPECIFIC ENVIRONMENTAL PROTECTION PLAN (C-SEPP)

1. Within two (2) weeks after the Effective Date, the Contractor shall submit to the Engineer for Acceptance, a Contract Specific Environmental Protection Plan (C-SEPP) for the Work using the C-SEPP template provided in the Agreement. No Site Work shall take place until the Engineer has Accepted the C-SEPP.

2. The Contractor’s C-SEPP shall be based upon the *General Environmental Requirements* of the Technical Specification of this Agreement (if applicable), the Project Wide Environmental Protection Plan (in Exhibit 11 - Company Supplied Documents), and the Contractor’s own corporate environmental management system.

3. The C-SEPP is prepared by the Contractor and is specific to the Work. The C-SEPP provides a practical way for the Contractor to demonstrate its understanding of environmental regulations, practices and procedures required to reduce, or eliminate, potential negative environmental effects.

4. The Contractor’s C-SEPP shall include the following, at a minimum (refer to the C-SEPP template for all requirements):

   - a description of the construction sequence (e.g. GANTT Chart);
   - roles and responsibilities;
   - mitigation procedures for all areas of environmental concern;
   - procedures for environmental monitoring;
   - maintenance requirements for environmental control structures;
   - procedures for post-activity clean-up and demolition; and

- contingency planning for environmental concerns.

5. The Contractor's C-SEPP shall also include any permits, registrations or notifications, required by Federal, Provincial, or aboriginal stakeholders for the proposed activities. The Contractor may be required to prepare additional environmental documentation prior to any fieldwork for non-time critical activities.

6. The Contractor is responsible for implementing, resourcing, and periodically verifying the C-SEPP. Contractor shall provide Engineer with an implementation schedule for the plan and with an update provided on a quarterly basis.

4 REPORTING

1. The Contractor shall conduct daily inspections of the Work to confirm environmental compliance. The inspections shall be documented by the Contractor in daily reports which shall be kept on file. Any non-compliance and corrective actions shall be documented by the Contractor.

2. The Contractor shall immediately notify the Engineer of all environmental incidents, including any loss of hazardous or controlled products. **Any spill meeting the following criteria shall be reported immediately to the Canadian Coast Guard at 709-772-2083 or 1-800-563-9089**:

    a. Any spill on a natural water body (marine or freshwater); or
    b. Any land-based spill:
        i. that is over 70 litres; or
        ii. of any quantity that has the potential (e.g. by migrating through subsurface soils/bedrock/substructures[2], etc) to enter a natural water body; or
        iii. of any quantity that has the potential to impact a privately owned property.

3. Once the spill is reported to the Canadian Coast Guard, the Engineer will liaise with other Authorities to provide additional information, as required.

4. The Contractor shall provide the Engineer with a monthly environmental performance report for the Work. The monthly cut-off for each report shall be the close of business day up to and including the final day of each calendar month. The Contractor's environmental performance report shall include, without limitation, the following:
    i. Hazardous and other waste generated during the period;
    ii. Environmental incidents, including loss of fuel or other hazardous products; and
    iii. Reported non-compliance and associated corrective actions.

[2] sewer systems, conduits, tunnels, etc

5. The Contractor shall complete and submit to the Engineer a Monthly Fuel Consumption Report, in the form as set out in Appendix C - Monthly Fuel Consumption Report, no later than 7 days after the end of each calendar month.

APPENDIX A

LIST OF PERMITS, ACCEPTANCES AND AUTHORIZATIONS

	Permit	Regulatory Body	Act	Responsibility for Completing Permit Applications
1	Application for Crown Lands - LCP related Infrastructure	DOEC	*Lands Act* of Newfoundland and Labrador	Engineer
2	Application for Crown Lands - Contractor Facilities	DOEC	*Lands Act* of Newfoundland and Labrador	Contractor
3	Notice of Intent for Reservation of Shoreline	DOEC	*Lands Act* of Newfoundland and Labrador	Engineer
4	Application for Water and Sewerage Works Permit	DOEC	*Water Resources Act* of Newfoundland and Labrador, Sections 36, 37 and 48	Contractor
5	Permit to Alter a Body of Water and Schedule A (Culverts)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
6	Permit to Alter a Body of Water and Schedule B (Bridges)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
7	Permit to Alter a Body of Water and Schedule C (Dams)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
8	Permit to Alter a Body of Water and Schedule D (Fording)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
9	Permit to Alter a Body of Water and Schedule E (Pipe Crossing - Water Intake)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer

	Permit	Regulatory Body	Act	Responsibility for Completing Permit Applications
10	Permit to Alter a Body of Water and Schedule F (Stream Modifications)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
11	Permit to Alter a Body of Water and Schedule G (Small Bridges)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
12	Permit to Alter a Body of Water and Schedule H (Other Alterations)	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
13	Application for Permit for Drilling a Non-Domestic Well - LCP related Infrastructure	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 58	Engineer
14	Application for Permit for Drilling a Non-Domestic Well - Contractor Facilities	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 58	Contractor
15	Application for Water use License - LCP related Infrastructure	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Engineer
16	Application for Water use License - Contractor Facilities	DOEC	*Water Resources Act* of Newfoundland and Labrador, Section 48	Contractor
17	GAP Registration	Service NL and DOEC	*Environmental Protection Act* of Newfoundland and Labrador	Contractor
18	Diesel Generator Registration Form	Service NL	*Environmental Protection Act* of Newfoundland and Labrador	Contractor

	Permit	Regulatory Body	Act	Responsibility for Completing Permit Applications
19	Permit for Access of any Highway	Service NL	*Urban and Rural Planning Act, 2000* of Newfoundland and Labrador *Works, Services and Transportation Act* of Newfoundland and Labrador	Engineer
20	Highway Services Signs Application	DTW	*Urban and Rural Planning Act, 2000* of Newfoundland and Labrador, subsections 36(2) and 39(2)	Contractor
21	Asphalt Plant Construction and Operation Form	Service NL	*Environmental Protection Act* of Newfoundland and Labrador	Contractor
22	Building Accessibility Design Registration / Exemption Registration - LCP related Infrastructure	Service NL	*Buildings Accessibility Act* of Newfoundland and Labrador	Engineer
23	Building Accessibility Design Registration / Exemption Registration - Contractor Facilities	Service NL	*Buildings Accessibility Act* of Newfoundland and Labrador	Contractor
24	Fire and Life Safety Review Plan (National Building Code) - LCP related Infrastructure	Service NL	*Buildings Accessibility Act* of Newfoundland and Labrador	Engineer

	Permit	Regulatory Body	Act	Responsibility for Completing Permit Applications
25	Fire and Life Safety Review Plan (National Building Code) - Contractor Facilities	Service NL	*Buildings Accessibility Act* of Newfoundland and Labrador	Contractor

APPENDIX C

MONTHLY FUEL CONSUMPTION REPORT

MONTHLY FUEL CONSUMPTION REPORT[1]

Contractor's Name: _____

Report completed by (please print): _____

Signature: _____

Reporting month/year (mm/yyyy): _____

Report date (dd/mm/yyyy): _____

Agreement Number: _____

Agreement Name: _____

Consumed Fuel			
Fuel Type		**unit**	**quantity**
Diesel		litres	
Gasoline		litres	
Heating oil		litres	
Propane		litres	
aviation turbo fuel		litres	
kerosene		litres	
Other (specify type)			
1		litres	
2		litres	
3		litres	
4		litres	
5		litres	
6		litres	
Total			

Notes:

1 To be completed by Contractor and submitted to the Engineer for each calendar month, no later than 7 days after end of each month.

2 Consumed fuel to be reported is defined as:

a) quantity of fuel transferred during the reporting month to tanks of all LCP-dedicated vehicles, equipment, and facilities, or

b) quantity of fuel used in the reporting month as part of a process (such as ANFO used for explosives); or

c) quantity of fuel delivered to bulk storage tanks at Company's Laydown Area within the reporting month by the Fuel Delivery Services Contractor.

3 Contractor shall provide as part of the Monthly Fuel Consumption Report a general listing of all types of equipment, facilities, and processes that have burned fuel during the reporting month. The types of equipment, facilities, and processes include, but are not limited to, the following: heavy equipment (e.g. excavators, bull dozers, concrete trucks, etc); light equipment and vehicles (e.g. pick-up trucks, chain saws, pumps); faciliites (e.g. diesel generators, concrete production, etc); processes (e.g. explosives in ANFO, etc); etc.

MONTHLY FUEL CONSUMPTION REPORT

General Listing of Fuel Burning Equipment, Facilities, and Processes

Equipment	Facilities	Processes

EXHIBIT 7

QUALITY REQUIREMENTS

1.0 INTRODUCTION

Without limiting the generality and application of the Agreement, Contractor will abide by and ensure Contractor Group abides with the quality requirements set forth in this Agreement.

2.0 QUALITY OBJECTIVES

The following quality objectives are required of Contractor:

a) Work will comply with the quality requirements of the Agreement;
b) Quality management systems of Contractor Group will ensure early and proactive identification of process or product failure so as to prevent problems before they occur or minimize rework, cost and schedule impacts, and to identify potential failures, opportunities for improvement and best practices;
c) Equipment and materials procured and/or installed by Contractor Group will be consistent with Exhibit 1 – Scope of Work;
d) Construction Work will be carried out in accordance with established construction standards and methods;
e) Completion activities will be executed in accordance with the procedures and manuals covering those activities; and
f) Documentation of objective evidence of conformance to the requirements will be maintained and recorded during the execution of the Work.

3.0 DEFINITIONS, TERMS AND ABBREVIATIONS

ISO 9001:2008	Quality Management Systems – Requirements
ISO 9000:2005	Quality Management Systems – Fundamentals and Vocabulary
ISO 10006: 2003	Quality Management Systems – Guidelines for Quality Management in Projects
ITP	Inspection and Test Plan
NCR	Nonconformity Report
PMI	Positive Material Identification
QA/QC	Quality Assurance/Quality Control
QMS	Quality Management System
QP	Quality Plan
SDRL	Exhibit 4 - Supplier Document Requirements List

4.0 CONTRACTOR'S RESPONSIBILITIES

a) Contractor shall comply with and ensure that Contractor Group complies with requirements outlined in this Exhibit 7.
b) The Contractor shall ensure that Contractor Group implements the quality activities described in this Exhibit 7.
c) Contractor shall demonstrate the implementation of its quality program and the compliance of its Work with the requirements of the Agreement.

d) In accordance with the Articles of the Agreement, Contractor shall provide the right of access to Company Group Personnel, to the Worksites to monitor the progress of the Work.
e) Contractor shall provide acceptable office accommodation, including internet connections for the Engineer's inspectors and expeditors. The level of involvement of inspectors and expeditors shall be determined by Engineer.
f) Contractor shall ensure that documents requiring a registered professional engineer's seal and signature shall be in accordance with the *Engineers and Geoscientists Act, 2008* of Newfoundland and Labrador and the by-laws of the Professional Engineers and Geoscientists – Newfoundland and Labrador (refer to www.pegnl.ca).

5.0 QUALITY MANAGEMENT SYSTEM

Contractor shall have an effectively implemented and maintained QMS for the execution of the Work. The QMS shall, at a minimum, be formally documented and compliant with the requirements of ISO 9001:2008. The QMS shall emphasize building quality into the Work through the use of documented control processes that incorporate activities necessary to assure quality.

The QMS shall be supported by an established quality organization with qualified resources, and formally documented control procedures to effectively administer and implement the requirements.

Prior to subcontracting any Work, Contractor shall demonstrate to Engineer that the selected Person has a quality management system that complies with the provisions of ISO 9001:2008. Contractor shall not Subcontract any part of the Work to a Person that does not meet the standards established by the ISO 9001:2008. These requirements also apply to Work to be performed by Subcontractors' subcontractors of every tier.

6.0 QUALITY ORGANIZATION

Contractor shall appoint a quality representative, empowered by management with freedom and authority to:
a) oversee the management of quality for the Work:
b) manage quality issues and their resolution; and
c) ensure compliance with the Agreement.

Contractor shall provide details of the QA/QC organization it intends to employ at the Worksites. Contractor shall appoint sufficient qualified Personnel to ensure that the quality management system, specifically the quality control and inspection activities, including those pertaining to any part of the Work, are achieved.

7.0 QUALITY DOCUMENTS

The SDRL identifies specific quality documentation required from Contractor and defines the required submission dates and form of submission. The SDRL and instructions for Contractor document requirements are contained in document 505573-0000-37AG-I-0015 (Document Number LCP-SN-CD-0000-IM-PR-0002-01), Lower Churchill Project Supplier Document Requirements located in Exhibit 11 – Company Supplied Documents. Contractor shall ensure that it meets all quality documentation requirements outlined in the Agreement.

8.0 QUALITY PLAN

8.1 GENERAL REQUIREMENTS

Contractor shall submit a QP, prepared in accordance with this Exhibit 7, to the Engineer for review and Acceptance. The QP shall include all aspects of the Work. All QP revisions are subject to review and Acceptance by Engineer prior to being implemented. Contractor shall:

a) Develop and maintain a QP stating the procedures, processes, resources and sequence of quality activities related to the Work;
b) Mandate one person to be responsible for development, approval and follow up of the QP;
c) Ensure QP review and revisions by Contractor's Personnel comprising representatives of all affected disciplines; and
d) Upon request, provide Engineer with the procedures and instructions to which the QP refers.

8.2 QUALITY PLAN CONTENT

The QP shall:

a) Accurately reflect the planning implemented by Contractor to comply with the Agreement;
b) Apply the guidelines of ISO 10006:2003 - Quality Management Systems – Guidelines for Quality Management in Projects;
c) Document any non-applicable requirement or any provision in the QP that does not comply with quality system requirements;
d) Identify each of the main stages of execution for each of the deliverable elements of the Work;
e) At a minimum, contain the following:
    i. Scope;
    ii. Quality objectives;
    iii. Definitions, terms and abbreviations;
    iv. Organization chart and quality related roles and responsibilities associated with all phases of the Work;
    v. Management review of Subcontracts;

vi. Documentation and records management; and
vii. Listing of all control procedures required to perform the Work (current and to be developed); and

f) Provide detailed descriptions of:

i. Responsibilities of Contractor's management related to QA/QC activities;
ii. The systems and procedures Contractor will use to ensure that quality is an intrinsic part of all aspects of the Work;
iii. Reviews, approvals required and checks and inspections to be conducted, including responsibilities and the timing of the required checks and inspections in the Work sequence;
iv. How procurement documents will be prepared to properly establish quality requirements with Subcontractors (and Subcontractors' subcontractors of every tier). Contractor shall require that Contractor Group prepare a product specific or service specific quality plan for of the Work of such Subcontractors and subcontractors;
v. How Persons, to whom Contractor proposes to Subcontract any part of the Work, will be evaluated and selected to ensure they have the requisite resources, tools, procedures, and quality capabilities to meet established requirements (this requirement also applies to proposed subcontractors of Subcontractors of every tier;
vi. How ITPs will be prepared. Each ITP shall include a list of the specifications that must be met, describe the tests that will be performed to ensure compliance, and identify who will perform the tests. Each plan shall identify inspections and QA/QC steps that will be taken by Contractor Group;
vii. How records will be maintained to demonstrate that all design, materials, equipment and construction conforms to established requirements and how and in what form the records will be submitted to the Engineer;
viii. How nonconformities, concessions and waivers shall be controlled and resolved including the process that will be used, the Personnel responsible for administering the process and the information flow through Contractor's organization for resolution;
ix. How all instruments used for testing and inspection will be properly certified, including PMI devices, equipment for calibrating instrumentation and hydrostatic test gauges;
x. The auditing, appraising, sampling techniques, reviews and reporting Contractor intends to carry out for the Work to confirm the effectiveness of the QA/QC activities, and that the QMSs are indeed delivering the quality required;
xi. How Contractor plans to meet requirements for PMI, source inspection and field quality control, including the frequency of testing, the locations where the testing will be conducted (e.g., Worksites, upon receipt at Worksites, following installation), and the type(s) of testing equipment to be used;
xii. Control procedures that adequately address the controls required for quality activities; and
xiii. Acceptance and rejection criteria applicable to the activity and approval requirements.

8.3 QUALITY AUDITS AND MANAGEMENT REVIEWS

Contractor shall provide a schedule of quality audits (both internal and external) and quality management system reviews to be performed during execution of the Work. The schedule of quality audits shall identify those planned audits of Contractor Group.

The schedule of audits shall be provided to Engineer on the later of four (4) weeks before start of the Work or two (2) weeks after the Effective Date.

Contractor shall report progress, on a monthly basis, on implementing any actions that arise from the audits or management system reviews.

8.4 SURVEILLANCE OF SUBSUPPLIERS AND SUBCONTRACTORS

Contractor shall perform surveillance and inspection of Contractor Group as well as review and approve dossiers provided by the Contractor Group to ensure that the requirements of the Agreement have been met.

Contractor shall identify planned verification activities used to assess and manage Contractor Group to ensure compliance with requirements of this Agreement.

The verification activities shall be documented in the QP and reported monthly together with the progress on audits and management reviews.

9.0 INSPECTION AND TEST PLANS

9.1 GENERAL REQUIREMENTS

Contractor shall develop and submit its inspection and test plan (ITP), which shall include those of its Subcontractors (and Subcontractors' subcontractors of every tier), for review and Acceptance by the Engineer on the later of four (4) weeks before start of the Work or two (2) weeks after the Effective Date.

The ITPs shall cover all aspects of the Work to be executed by Contractor Group and shall implement and maintain all quality activities described therein.

Contractor will notify Engineer of all hold and witness points ten (10) Business Days prior to the scheduled date of such activity. Contractor will reconfirm the scheduled date of such activity seventy-two (72) hours prior to commencement. The Contractor shall identify upcoming hold and witness points for the next six (6) months in the Monthly Progress Report (as referenced in Exhibit 3 - Coordination Procedures).

9.2 INSPECTION AND TEST PLAN CONTENT

Contractor is required to follow all of the instructions below in preparing the ITPs, and acknowledges that the Engineer review will be based on these instructions.

a) Identification
   - Code the ITP, identify the revision and date;
   - Identify the Company, project and sector;
   - Identify the Agreement, as well as the component, discipline or system to which the ITP applies; and
   - Identify the Personnel responsible for quality, at all Worksites.

b) Work Items and Steps
   - These are normally copied from the elements of the Contractor' Group's detailed Work schedule. Complimentary or specific details may be required; and
   - Contractor shall ensure ITPs, as far as practical, follow the normal sequencing of the Work. ITPs shall identify the stages requiring approval, inspection and testing hold and witness points.

c) Control Activities
   - The control points, including their summary description (inspection, verification, tests) shall be inserted in the detailed Work schedule.

d) Responsibilities
   - Identify Contractor's Personnel responsible for control activities.

e) Frequency
   - Specify the percentage, frequency or sampling rate applicable to the control points.

f) Reference to Specifications
   - Control activities shall refer to applicable drawings, specification sections and/or specifications/codes;
   - Identify parameters and characteristics that will be mainly considered in the controls; and
   - For each control, identify and note down the criteria and/or tolerances for approval.

g) Procedures Used
   - Identify the procedures or instructions developed by Contractor or Subcontractors (or Subcontractors' subcontractors of every tier) to perform control and testing.

h) Control Equipment
   - Describe and identify the equipment to be used for quality control. Users shall provide evidence of the calibration status.

i) Checklists
   - The information identified above can be recorded in a checklist prepared by Contractor. The checklists shall be appended.

j) Forms
   - Identify the forms to be used to record the control point results and append them to the ITP. The recorded results will constitute an inspection or testing report.

k) Engineer's Control Points

- The type of control points, namely: witness, hold or documentation review will be identified during ITP review by the Engineer.

l) Quality Records
- Identify the types of records to be included in the quality records, to be submitted to the Engineer, and include the applicable standard table of contents.

m) Remarks
- Include all other relevant information that may be useful in carrying out the ITP.

9.3 FINAL INSPECTION AND DECLARATION OF COMPLETION

Appendix A - Declaration of Installation and Inspection Completion ("Declaration") of this Exhibit 7 will be completed by Contractor upon completion of aspects of the Work. Contractor shall confirm that these aspects of Work are complete and comply with the requirements outlined in the Agreement, that all related quality records have been submitted to Engineer and confirm that Engineer carry out its final inspection on that aspect of Work.

Upon receipt of a Declaration, Engineer will conduct a final inspection of the aspect of Work described therein and, if necessary, issue a deficiency list if it is determined that the aspect of Work is not complete or includes elements that do not comply with the requirements of the Agreement.

When Contractor has corrected all deficiencies and the quality records are Accepted by Engineer, the Declaration will be Accepted by Engineer and an Accepted copy will be returned to Contractor.

10.0 NONCONFORMITY REPORTING

Contractor shall submit, to Engineer for review and Acceptance, its nonconformity, corrective action, preventive action procedure(s) and resolution reporting form.

Contractor will ensure that all nonconformities, which shall take on the definition of noncompliance with a requirement of ISO 9000:2005 Quality Management Systems – Fundamentals and Vocabulary, are recorded, investigated and resolved to Engineer's satisfaction.

All of Contractor's Personnel shall have a responsibility to identify apparent nonconformities arising from the execution of the Work.

Contractor shall maintain a register of all applicable and open nonconformity reports. The status of all NCRs shall be reported in the Monthly Progress Report (as referenced in Exhibit 3 - Coordination Procedures).

Contractor's NCR form may be used but, at a minimum, it shall contain the following:

a) Project number;
b) NCR number;
c) Contractor;
d) Project name/location;
e) Purchase order/contract number;
f) Product description (including part #, serial # and tag #);
g) Date opened;
h) Date closed;
i) NCR description;
j) Action by;
k) Status;
l) Root cause analysis;
m) Resolution proposed; and
n) Resolution Implemented.

Contractor shall identify Personnel responsible for verifying and resolving NCRs.

11.0 QUALITY RECORDS

Contractor's quality records shall include, as a minimum, the following documents:
a) Inspector qualifications (quality control);
b) Welder's qualifications ;
c) Checklists;
d) Relevant inspection and testing reports;
e) Materials analysis certificates, when required;
f) Steel works certificates;
g) Paint specification sheet, when required;
h) Identification and traceability documentation;
i) Engineer Approved deviations;
j) Closed out nonconformity reports, corrective and preventive actions;
k) Completed test packages;
l) Preservation records;
m) Declarations to Authorities, when required;
n) As-built drawings;
o) As-built specifications;
p) As-built bills of material;
q) Various required manuals;
r) All Accepted Declaration of Installation and Inspection Completion forms (Appendix A); and
s) Shipping authorization.

Quality records shall be retained until the later of (a) seven (7) years after the satisfaction of all of the obligations of Contractor pursuant to this Agreement, (b) seven (7) years after expiration or any termination of this Agreement, or (c) such longer period as may be required under Applicable Laws. During this period, the quality records shall

be available to Engineer and Company for inspection and audit.

12.0 ENGINEER'S ACTIVITIES

12.1 Engineer shall be entitled, at its sole discretion, to perform certain QA/QC activities, the performance of which shall not relieve Contractor of its responsibilities under this Agreement or its overall responsibility for quality of the Work. These QA/QC activities may include:

a) Audit of Contractor's QA/QC program and include any or all of the following:
   - Review of Contractor's documented QA/QC plans and procedures;
   - Random review of Contractor's procurement documents for inspection and specification content;
   - Review of Contractor's specific equipment inspection and test plans in relation to specification requirements;
   - Review of inspector's surveillance and non-conformance reports, Contractor's deviation log, procedure approval logs;
   - Receipt of inspection discrepancy reports and field inspection reports;
   - Review of activities undertaken by Contractor Group;

b) Independent source inspections. Results of Engineer source inspections will be made available to Contractor and Contractor shall address and resolve any issues arising from these inspections;

c) Review and assessment of Contractor Group quality plans and ITPs;

d) Review and assessment of Contractor's control procedures and audit schedule, monitoring compliance and monitoring resolution of any issues raised;

e) Participation in selected pre-inspection and pre-production meetings;

f) Conducting oversight of Contractor's quality activities including Contractor Group inspection activities, field inspection and surveillance activities, along with participation in inspection and test stages outlined in Accepted ITPs;

g) Review and Acceptance of NCRs where proposed dispositions do not result in meeting specifications; and

h) Other activities as deemed appropriate by Engineer.

12.2 Engineer shall, at its sole discretion, perform pre-planned shop expediting activities at Contractor's premises to ensure that critical scheduled milestones are being maintained. Pursuant to Article 14 of the Agreement, Engineer's nominated Shop Expeditor shall be allowed free access to perform the following activities:

a) Review and reconciliation of supplier data/engineering issues complete with committed submittal dates from the Contractor Group to the Engineer;

b) Review of the Contractor's sub-order status report to confirm that delivery dates for major buy-out components fully support the Contractor's schedule;

c) Review of the Contractor's current fabrication schedule, and those of its SubContractors and SubContractors' subContractors and subContractors of every tier;

d) Visually verify by means of a shop tour that Contractor's forecasted procurement, fabrication, testing and shipping milestones are proceeding on schedule; and
e) Other activities as deemed appropriate by Engineer.

Engineer's Shop Expeditor shall have the right to give Contractor instructions on the timely preparation of and adherence to the Contractor's schedule covering activities in engineering, issuance of drawings and data, procurement, fabrication, assembly, inspections, testing and shipping.

Contractor shall provide its full cooperation to facilitate such expediting access during all phases of the Agreement.

13.0 QUALITY SURVEILLANCE & EXPEDITING RELEASE

In all cases a Quality Surveillance Release (in the form set out in Appendix B - Quality Surveillance Release) and Expediting Release Notice (in the form set out in Appendix C - Expediting Release Notice) is required for all fabricated equipment and materials supplied by Contractor Group prior to Delivery. Bulk materials and off the shelf items will require an Expediting Release Notice. The Quality Surveillance Release and Expediting Release Notice shall be a hold point on all Contractor ITP's.

It is the Contractor's responsibility to contact the Engineer to notify when the equipment/material is ready for final inspection/release.

A Quality Surveillance Release shall not be issued until Engineer is satisfied that:

- All NCRs and Corrective Action Requests have been closed out;
- All inspection and test points shown on the Contractor's Accepted ITP have been completed and signed off by all Parties; and
- All required documentation is fully completed and reviewed for compliance.

The final Quality Surveillance Release is issued to the Contractor to Accept the Goods as presented by the Contractor. The release does not relieve the Contractor of any responsibility for the quality of Work or any obligations related to the specification, codes/standards or Agreement requirements.

The final Expediting Release Notice will be issued by the Engineer once all requirements of the Agreement are met.

A copy of the Company/Engineer Approved Quality Surveillance Release and Expediting Release Notice shall be issued to the Contractor for attachment to the packing list.

1	Sealings	Rubberart	Brazil, Sweden	YES	1%
2	Bearings	Ina, SKF	Germany	YES	2%
			Total % for Proposed Material Sources		**3%**

Total % for Proposed Manufacturers, Subcontractors, and Material Sources [c] 93%

General Note:

(a) Same as location of testing and inspection
(b) Based on the total value of the Work related to the Equipment supply only
(c) The remaining components will come from various vendors to be identified during the contract execution

The above list includes major components only. Other vendor names for miscellaneous items will be provided during contract execution.

All the manufacturers, subcontractors and suppliers included in the above plan are selected from the Andritz Hydro qualified supplier list. For major components, Andritz Hydro relies only on companies that have a long and satisfactory track record from previous projects executed for Andritz Hydro.

As the Muskrat Falls project will be executed between 2013 & 2018, the forecasted workload information is not currently available. For now, all proposed companies have the capacity available for a project like Muskrat Falls. Production slots are booked for a specific project at the time of purchase order placement. At that time, the workload of each company will be assessed and purchase orders will be placed only with companies that can execute per the project's required schedule.

EXHIBIT 9

INTERFACE AND MILESTONE SCHEDULE

Contractor shall comply with the requirements outlined in Part 2, Exhibit 9 - Work and Milestone Schedule. Contractor's schedule shall clearly indicate bidder's work plans and methods, as well as interfaces with other parties. Contractors Control Schedule Baseline Document shall align with this Exhibit 9.

The schedule shall be provided in portable document format (PDF) and native electronic format. Unless otherwise approved by company, the native file shall be generated from the Primavera planning software.

638753 N.B. INC.

Schedule - Share Structure

The Corporation is authorized to issue:

(a) an unlimited number of Common shares, without nominal or par value;

(b) an unlimited number of Class A Preferred shares, without nominal or par value; and

(d) an unlimited number of Class B Preferred shares, without nominal or par value.

I. The Common shares shall have attached thereto the following rights, privileges, restrictions and conditions:

(a) Voting. Each Common share shall entitle the holder thereof to one (1) vote at all meetings of the shareholders of the Corporation (except meetings at which only holders of another specified class of shares are entitled to vote pursuant to the provisions hereof or pursuant to the provisions of the Act).

(b) Dividends. The holders of the Common shares shall be entitled to receive, as and when declared by the board of directors, subject to the rights, privileges, restrictions and conditions attaching to the Class A Preferred shares and Class B Preferred shares, in equal amounts per Common share, dividends payable in money, property or by the issue of fully paid shares of the capital of the Corporation.

(c) Liquidation, etc. In the event of the liquidation, dissolution or winding-up of the Corporation, whether voluntary or involuntary, or other distribution of assets of the Corporation among shareholders for the purpose of winding-up its affairs, subject to the rights, privileges, restrictions and conditions attaching to the Class A Preferred shares and the Class B Preferred shares, the holders of the Common shares shall be entitled to receive, in equal amounts per Common share, the remaining property of the Corporation.

II. The Class A Preferred shares shall have attached thereto the following rights, privileges, restrictions and conditions:

(a) Non-Voting. Subject to the provisions of the Act or as otherwise expressly provided herein, the holders of the Class A Preferred shares shall not be entitled to receive notice of, nor to attend or vote at meetings of the shareholders of the Corporation.

(b) Dividends. The holders of the Class A Preferred shares shall be entitled to receive during each month, as and when declared by the board of directors, but always in preference and priority to any payment of dividends on the Class B Preferred shares and the Common shares or any other shares ranking junior to the Class A Preferred shares non-cumulative dividends at a fixed rate of one half of one percent (0.50%) per month calculated on the Class A Preferred Redemption Price (as hereinafter in paragraph II. (h) defined) of each such share payable in money, property or by the issue of fully paid shares of any class of the Corporation. The holders of the Class A Preferred shares shall not be entitled to any dividend in excess of the dividend hereinbefore provided for.

(c) Liquidation, etc. In the event of the liquidation, dissolution or winding-up of the Corporation, whether voluntary or involuntary, or other distribution of assets of the Corporation among shareholders for the purpose of winding-up its affairs, the holders of the Class A Preferred shares shall be entitled to receive for each Class A Preferred share, in preference and priority to any distribution of the property or assets of the Corporation to the holders of the Class B Preferred shares, the Common shares or to any other shares ranking junior to the Class A Preferred shares, an amount equal to the Class A Preferred Redemption Price plus all declared and unpaid dividends thereon, but shall not be entitled to share any further in the distribution of the property or assets of the Corporation.

(d) Redemption by Corporation. The Corporation may, in the manner hereinafter provided, redeem at any time all, or from time to time any part, of the outstanding Class A Preferred shares on payment for each Class A Preferred share to be redeemed of the Class A Preferred Redemption Price plus all declared and unpaid dividends thereon (in paragraphs II. (e), (f) and (g) called the "Redemption Price").

(e) Procedure on Redemption. Before redeeming any Class A Preferred shares, the Corporation shall mail or deliver to each person who, at the date of such mailing or delivery, shall be a registered holder of Class A Preferred shares to be redeemed, notice of the intention of the Corporation to redeem such shares held by such registered holder; such notice shall be delivered to, or mailed by ordinary prepaid post addressed to, the last address of such holder as it appears on the records of the Corporation, or in the event of the address of any such holder not appearing on the records of the Corporation, then to the last address of such holder known to the Corporation, at least five (5) days before the date specified for redemption; such notice shall set out the Redemption Price, the date on which the redemption is to take place and, if part only of the Class A Preferred shares held by the person to whom it is addressed is to be redeemed, the number thereof so to be redeemed; on or after the date so specified for redemption the Corporation shall pay or cause to be paid the Redemption Price to the registered holders of the Class A Preferred shares to be redeemed on presentation and surrender of the certificates for the Class A Preferred shares so called for redemption at the registered office of the Corporation or at such other place or places as may be specified in such notice, and the certificates for such Class A Preferred shares shall thereupon be cancelled, and the Class A Preferred shares represented thereby shall thereupon be redeemed; from and after the date specified for redemption in such notice, the holders of the Class A Preferred shares called for redemption shall cease to be entitled to dividends in respect of such shares and shall not be entitled to exercise any of the rights of the holders thereof, except the right to receive the Redemption Price, unless payment of the Redemption Price shall not be made by the Corporation in accordance with the foregoing provisions, in which case the rights of the holders of such shares shall remain unaffected; on or before the date specified for redemption, the Corporation shall have the right to deposit the Redemption Price of the Class A Preferred shares called for redemption in a special account with any chartered bank or trust company in Canada named in the notice of redemption, to be paid, without interest, to or to the order of the respective holders of such Class A Preferred shares called for redemption, upon presentation and surrender of the certificates representing the same and, upon such deposit being made or upon the date specified for redemption, whichever is later, the Class A Preferred shares in respect whereof such deposit shall have been made, shall be deemed to be redeemed and the rights of the respective holders thereof, after such deposit or after such redemption date, as the case may be, shall be limited to receiving, out of the moneys so deposited, without interest, the Redemption Price applicable to their respective Class A Preferred shares against presentation and surrender of the certificates representing such Class A Preferred shares. If less than all of the Class A Preferred shares are to be redeemed the shares to be redeemed shall be redeemed pro rata, disregarding fractions, unless the holders of the Class A Preferred shares unanimously agree to the adoption of another method of selection of the Class A Preferred shares to be redeemed. If less than all of the Class A Preferred shares represented by any certificate be redeemed, a new certificate for the balance shall be issued.

(f) Redemption by Holder. A holder of Class A Preferred shares shall be entitled to require the Corporation to redeem at any time all, or from time to time any part, of the Class A Preferred shares registered in the name of such holder by tendering to the Corporation at its registered office the share certificate(s) representing the Class A Preferred shares which the registered holder desires to have the Corporation redeem together with a request in writing specifying (i)the number of Class A Preferred shares which the registered holder desires to have redeemed by the Corporation and (ii) the business day (in this paragraph referred to as the "Redemption Date") on which the holder desires to have the Corporation redeem such Class A Preferred shares, which Redemption Date shall not be less than five (5) days after the day on which the request in writing is given to the Corporation. Upon receipt of the share certificate(s) representing the Class A Preferred shares which the registered holder desires to have the Corporation redeem together with such a request, the Corporation shall on, or at its option, before, the Redemption Date redeem such Class A Preferred shares by paying to the registered holder thereof, for each share to be redeemed, an amount equal to the Redemption Price in respect thereof; such payment shall be made by cheque payable at par at any branch of the Corporation's bankers for the time being in Canada. The said Class A Preferred shares shall be deemed to be redeemed on the date of payment of the Redemption Price and from and after such date such Class A Preferred shares shall cease to be entitled to dividends and the holders thereof shall not be entitled to exercise any of the rights of the holders of Class A Preferred shares in respect thereof. Notwithstanding the foregoing, the Corporation shall only be obliged to redeem Class A Preferred shares so tendered for redemption to the extent that such redemption would not be contrary to any applicable law, and if such redemption of any such Class A Preferred shares would be contrary to any applicable law, the Corporation shall only be obliged to redeem such Class A Preferred shares to the extent that the moneys applied thereto shall be such amount (rounded to the next lower multiple of one hundred dollars ($100.00)) as would not be contrary to such law, in which case the Corporation shall pay to each holder his pro rata share of the purchase moneys allocable. If less than all of the Class A Preferred shares represented by any certificate be redeemed, a new certificate for the balance shall be issued.

(g) Purchase for Cancellation. The Corporation may purchase for cancellation at any time all, or from time to time any part, of the Class A Preferred shares outstanding, by private contract at any price, with the unanimous consent of the holders of the Class A Preferred shares then outstanding, or by invitation for tenders addressed to all the holders of the Class A Preferred shares at the lowest price at which, in the opinion of the directors, such shares are obtainable but not exceeding the Redemption Price thereof. If less than all of the Class A Preferred shares represented by any certificate be purchased for cancellation, a new certificate for the balance shall be issued.

(h) Class A Preferred Redemption Price. For the purposes of the foregoing paragraphs II. (b), (c) and (d), the "Class A Preferred Redemption Price" of each Class A Preferred share shall be an amount equal to the aggregate of (i) the monetary consideration received by the Corporation upon the issuance of such share, if such share has been issued for money and (ii) the fair market value of the consideration received by the Corporation (including, without limitation, shares of another class of the Corporation) upon the issuance of such share, if such share has been issued in whole or in part for consideration other than money, less (iii) the aggregate of all amounts by which the stated capital per Class A Preferred share has been reduced from the date of issuance until immediately before the time of redemption. Subject to the provisions of the following sub-paragraph, such fair market value is to be determined by the directors on the basis of generally accepted accounting and valuation principles.

The fair market value determined as hereinabove provided for shall be subject to revision in accordance with any binding agreement with, or decision by, the appropriate taxation authorities, or any judgment of a court of competent jurisdiction. In the event that any such agreement, decision or judgment shall result in a final determination under the provisions of the appropriate taxation legislation and the amount thereby determined is an amount other than the amount for which such share was originally issued as determined by the directors in accordance with the preceding subparagraph, such finally determined amount for the purpose of the appropriate taxation legislation shall then be deemed to have been the fair market value of the consideration received by the Corporation upon the issuance of such Class A Preferred share. Such final determination shall reflect any assessment by the Minister of National Revenue or other taxing authority to which no appeal is taken or any agreement reached by the Corporation or any holder of a Class A Preferred share and a said taxing authority in settlement of a dispute regarding such assessment or proposed assessment, or any decision by a court or tribunal of competent jurisdiction regarding the fair market value of the Class A Preferred share or the consideration received by the Corporation upon the issuance of such Class A Preferred share to which no appeal may be taken or the period during which an appeal may be taken has expired.

In the event that, subsequent to any redemption of Class A Preferred shares, the Class A Preferred Redemption Price of each Class A Preferred share is adjusted pursuant to a revision of fair market value as aforementioned, either the Corporation shall pay out to the former holders of such redeemed Class A Preferred shares or the said former holders of the redeemed Class A Preferred shares will reimburse the Corporation as the case may be, the difference between the Class A Preferred Redemption Price of the said Class A Preferred shares as adjusted and the amount paid by the Corporation upon redemption, within sixty (60) days from the date of adjustment of the Class A Preferred Redemption Price.

(i) Stated Capital. In the event that only part of the amount of the consideration received by the Corporation for any Class A Preferred share issued by the Corporation is added to the stated capital account of the Class A Preferred shares, such Class A Preferred share shall be deemed to have been issued for the full amount of the consideration received, for all purposes of these articles (except only with respect to the stated capital of such Class A Preferred shares) including, but without limiting the generality of the foregoing, dividend rights, redemption rights and rights upon liquidation and dissolution.

(j) No Change. No change to any of the provisions of paragraphs II. (a) to (i) or of this paragraph (j) shall have any force or effect until it has been approved by a majority of not less than two-thirds (2/3) of the votes cast by the holders of the Class A Preferred shares, voting separately as a class at a meeting of such holders specially called for that purpose, or by a resolution in writing signed by all the holders of the Class A Preferred shares, in addition to any other approval required by the Act.

III. The Class B Preferred shares shall have attached thereto the following rights, privileges, restrictions and conditions:

(a) Non-Voting. Subject to the provisions of the Act or as otherwise expressly provided herein, the holders of the Class B Preferred shares shall not be entitled to receive notice of, nor to attend or vote at meetings of the shareholders of the Corporation.

(b) Dividends. The holders of the Class B Preferred shares shall be entitled to receive during each month, as and when declared by the board of directors, but always in preference and priority to any payment of dividends on the Common shares or any other shares ranking junior to the Class B Preferred shares, but after payment of dividends to the holders of the Class A Preferred shares, non-cumulative dividends at a fixed rate of fifty-four one hundredths of one percent (0.54%) per month calculated on the Class B Preferred Redemption Price (as hereinafter in paragraph III. (h) defined) of each such share payable in money, property or by the issue of fully paid shares of any class of the Corporation. The holders of the Class B Preferred shares shall not be entitled to any dividend in excess of the dividend hereinbefore provided for.

(c) Liquidation, etc. In the event of the liquidation, dissolution or winding-up of the Corporation, whether voluntary or involuntary, or other distribution of assets of the Corporation among shareholders for the purpose of winding-up its affairs, the holders of the Class B Preferred shares shall be entitled to receive for each Class B Preferred share, in preference and priority to any distribution of the property or assets of the Corporation to the holders of the Common shares or any other shares ranking junior to the Class B Preferred shares, but after distribution to the holders of the Class A Preferred shares, an amount equal to the Class B Preferred Redemption Price plus all declared and unpaid dividends thereon, but shall not be entitled to share any further in the distribution of the property or assets of the Corporation.

(d) Redemption by Corporation. The Corporation may, in the manner hereinafter provided, redeem at any time all, or from time to time any part, of the outstanding Class B Preferred shares on payment for each Class B Preferred share to be redeemed of the Class B Preferred Redemption Price plus all declared and unpaid dividends thereon (in paragraphs III. (e), (f) and (g) called the "Redemption Price").

(e) Procedure on Redemption. Before redeeming any Class B Preferred shares, the Corporation shall mail or deliver to each person who, at the date of such mailing or delivery, shall be a registered holder of Class B Preferred shares to be redeemed, notice of the intention of the Corporation to redeem such shares held by such registered holder; such notice shall be delivered to, or mailed by ordinary prepaid post addressed to, the last address of such holder as it appears on the records of the Corporation, or in the event of the address of any such holder not appearing on the records of the Corporation, then to the last address of such holder known to the Corporation, at least five (5) days before the date specified for redemption; such notice shall set out the Redemption Price, the date on which the redemption is to take place and, if part only of the Class B Preferred shares held by the person to whom it is addressed is to be redeemed, the number thereof so to be redeemed; on or after the date so specified for redemption the Corporation shall pay or cause to be paid the Redemption Price to the registered holders of the Class B Preferred shares to be redeemed on presentation and surrender of the certificates for the Class B Preferred shares so called for redemption at the registered office of the Corporation or at such other place or places as may be specified in such notice, and the certificates for such Class B Preferred shares shall thereupon be cancelled, and the Class B Preferred shares represented thereby shall thereupon be redeemed; from and after the date specified for redemption in such notice, the holders of the Class B Preferred shares called for redemption shall cease to be entitled to dividends in respect of such shares and shall not be entitled to exercise any of the rights of the holders thereof, except the right to receive the Redemption Price, unless payment of the Redemption Price shall not be made by the Corporation in accordance with the foregoing provisions, in which case the rights of the holders of such shares shall remain unaffected; on or before the date specified for redemption, the Corporation shall have the right to deposit the Redemption Price of the Class B Preferred shares called for redemption in a special account with any chartered bank or trust company in Canada named in the notice of redemption, to be paid, without interest, to or to the order of the respective holders of such Class B Preferred shares called for redemption, upon presentation and surrender of the certificates representing the same and, upon such deposit being made or upon the date specified for redemption, whichever is later, the Class B Preferred shares in respect whereof such deposit shall have been made, shall be deemed to be redeemed and the rights of the respective holders thereof, after such deposit or after such redemption date, as the case may be, shall be limited to receiving, out of the moneys so deposited, without interest, the Redemption Price applicable to their respective Class B Preferred shares against presentation and surrender of the certificates representing such Class B Preferred shares. If less than all of the Class B Preferred shares are to be redeemed, the shares to be redeemed shall be redeemed pro rata, disregarding fractions, unless the holders of the Class B Preferred shares unanimously agree to the adoption of another method of selection of the Class B Preferred shares to be redeemed. If less than all of the Class B Preferred shares represented by any certificate be redeemed, a new certificate for the balance shall be issued.

(f) Redemption by Holder. A holder of Class B Preferred shares shall be entitled to require the Corporation to redeem at any time all, or from time to time any part, of the Class B Preferred shares registered in the name of such holder by tendering to the Corporation at its registered office the share certificate(s) representing the Class B Preferred shares which the registered holder desires to have the Corporation redeem together with a request in writing specifying (i)the number of Class B Preferred shares which the registered holder desires to have redeemed by the Corporation and (ii) the business day (in this paragraph referred to as the "Redemption Date") on which the holder desires to have the Corporation redeem such Class B Preferred shares, which Redemption Date shall not be less than five (5) days after the day on which the request in writing is given to the Corporation. Upon receipt of the share certificate(s) representing the Class B Preferred shares which the registered holder desires to have the Corporation redeem together with such a request, the Corporation shall on, or at its option, before, the Redemption Date redeem such Class B Preferred shares by paying to the registered holder thereof, for each share to be redeemed, an amount equal to the Redemption Price in respect thereof; such payment shall be made by cheque payable at par at any branch of the Corporation's bankers for the time being in Canada. The said Class B Preferred shares shall be deemed to be redeemed on the date of payment of the Redemption Price and from and after such date such Class B Preferred shares shall cease to be entitled to dividends and the holders thereof shall not be entitled to exercise any of the rights of the holders of Class B Preferred shares in respect thereof. Notwithstanding the foregoing, the Corporation shall only be obliged to redeem Class B Preferred shares so tendered for redemption to the extent that such redemption would not be contrary to any applicable law, and if such redemption of any such Class B Preferred shares would be contrary to any applicable law, the Corporation shall only be obliged to redeem such Class B Preferred shares to the extent that the moneys applied thereto shall be such amount (rounded to the next lower multiple of one hundred dollars ($100.00)) as would not be contrary to such law, in which case the Corporation shall pay to each holder his pro rata share of the purchase moneys allocable. If less than all of the Class B Preferred shares represented by any certificate be redeemed, a new certificate for the balance shall be issued.

(g) Purchase for Cancellation. The Corporation may purchase for cancellation at any time all, or from time to time any part, of the Class B Preferred shares outstanding, by private contract at any price, with the unanimous consent of the holders of the Class B Preferred shares then outstanding, or by invitation for tenders addressed to all the holders of the Class B Preferred shares at the lowest price at which, in the opinion of the directors, such shares are obtainable but not exceeding the Redemption Price thereof. If less than all of the Class B Preferred shares represented by any certificate be purchased for cancellation, a new certificate for the balance shall be issued.

(h) Class B Preferred Redemption Price. For the purposes of the foregoing paragraphs III. (b), (c) and (d), the "Class B Preferred Redemption Price" of each Class B Preferred share shall be an amount equal to the aggregate of (i) the monetary consideration received by the Corporation upon the issuance of such share, if such share has been issued for money and (ii) the fair market value of the consideration received by the Corporation (including, without limitation, shares of another class of the Corporation) upon the issuance of such share, if such share has been issued in whole or in part for consideration other than money, less (iii) the aggregate of all amounts by which the stated capital per Class B Preferred share has been reduced from the date of issuance until immediately before the time of redemption. Subject to the provisions of the following sub-paragraph, such fair market value is to be determined by the directors on the basis of generally accepted accounting and valuation principles.

The fair market value determined as hereinabove provided for shall be subject to revision in accordance with any binding agreement with, or decision by, the appropriate taxation authorities, or any judgment of a court of competent jurisdiction. In the event that any such agreement, decision or judgment shall result in a final determination under the provisions of the appropriate taxation legislation and the amount thereby determined is an amount other than the amount for which such share was originally issued as determined by the directors in accordance with the preceding subparagraph, such finally determined amount for the purpose of the appropriate taxation legislation shall then be deemed to have been the fair market value of the consideration received by the Corporation upon the issuance of such Class B Preferred share. Such final determination shall reflect any assessment by the Minister of National Revenue or other taxing authority to which no appeal is taken or any agreement reached by the Corporation or any holder of a Class B Preferred share and a said taxing authority in settlement of a dispute regarding such assessment or proposed assessment, or any decision by a court or tribunal of competent jurisdiction regarding the fair market value of the Class B Preferred share or the consideration received by the Corporation upon the issuance of such Class B Preferred share to which no appeal may be taken or the period during which an appeal may be taken has expired.

In the event that, subsequent to any redemption of Class B Preferred shares, the Class B Preferred Redemption Price of each Class B Preferred share is adjusted pursuant to a revision of fair market value as aforementioned, either the Corporation shall pay out to the former holders of such redeemed Class B Preferred shares or the said former holders of the redeemed Class B Preferred shares will reimburse the Corporation as the case may be, the difference between the Class B Preferred Redemption Price of the said Class B Preferred shares as adjusted and the amount paid by the Corporation upon redemption, within sixty (60) days from the date of adjustment of the Class B Preferred Redemption Price.

(i) Stated Capital. In the event that only part of the amount of the consideration received by the Corporation for any Class B Preferred share issued by the Corporation is added to the stated capital account of the Class B Preferred shares, such Class B Preferred share shall be deemed to have been issued for the full amount of the consideration received, for all purposes of these articles (except only with respect to the stated capital of such Class B Preferred shares) including, but without limiting the generality of the foregoing, dividend rights, redemption rights and rights upon liquidation and dissolution.

(j) No Change. No change to any of the provisions of paragraphs III. (a) to (i) or of this paragraph (j) shall have any force or effect until it has been approved by a majority of not less than two-thirds (2/3) of the votes cast by the holders of the Class B Preferred shares, voting separately as a class at a meeting of such holders specially called for that purpose, or by a resolution in writing signed by all the holders of the Class B Preferred shares, in addition to any other approval required by the Act.

638753 N.B. INC.

Schedule - Other Provisions

1. PLACE OF SHAREHOLDER MEETINGS

Notwithstanding subsections (1) and (2) of Section 84 of the Business Corporations Act, as from time to time in force, meetings of shareholders of the Corporation may be held at any place outside New Brunswick.

2. NOTICE OF SHAREHOLDER MEETINGS

Notwithstanding subsection (1) of Section 87 of the Business Corporations Act, as from time to time in force, notice of time and place of a meeting of shareholders of the Corporation shall be deemed to be properly given if sent not less than Five (5) days before such meeting:

(a) to each shareholder entitled to vote at the meeting;

(b) to each director; and

(c) to the auditor, if any.

3. PRE-EMPTIVE RIGHTS

(A) Notwithstanding subsection (2) of Section 27 of the Business Corporations Act, as from time to time in force, but subject however to any rights arising under any unanimous shareholders agreements, the holders of equity shares of any class, in the case of the proposed issuance by the Corporation of, or the proposed granting by the Corporation of rights or options to purchase, its equity shares of any class of any shares or other securities convertible into or carrying rights or options to purchase its equity shares of any class, shall not as such, even if the issuance of the equity shares proposed to be issued or issuable upon exercise of such rights or options or upon conversion of such other securities would adversely affect the unlimited dividend rights of such holders, have the pre-emptive right as provided by Section 27 of the Business Corporations Act to purchase such shares or other securities.

(B) Notwithstanding subsection (3) of Section 27 of the Business Corporations Act, as from time to time in force, but subject however to any rights arising under any unanimous shareholders agreements, the holders of voting shares of any class, in case of the proposed issuance by the Corporation of, or the proposed granting by the Corporation of rights or options to purchase, its voting shares of any class or any shares or options to purchase its voting shares of any class, shall not as such, even if the issuance of the voting shares proposed to be issued or issuable upon exercise of such rights or options or upon conversion of such other securities would adversely affect the voting rights of such holders, have the pre-emptive right as provided by Section 27 of the Business Corporations Act to purchase such shares or other securities.

4. PRIVATE CORPORATION RESTRICTIONS

(A) The number of shareholders, exclusive of persons who are in the employment of the Corporation and are shareholders of the Corporation and persons who, having been formerly in the employment of the Corporation, have continued to be shareholders of the Corporation after termination of that employment, is limited to not more than Fifty (50) persons, two or more persons who are joint registered holders of one or more shares being counted as one shareholder.

(B) Any invitation to the public to subscribe for any shares, debentures or other securities of the Corporation shall be prohibited.

5. FINANCIAL ASSISTANCE

The Corporation may, directly or indirectly, give financial assistance by means of a loan, guarantee or otherwise:

(a) to any shareholder, director, officer or employee of the Corporation or of an affiliated corporation, or

(b) to any associate of a shareholder, director, officer or employee of the Corporation or of an affiliated corporation;

whether or not:

(c) the Corporation is, or after giving the financial assistance would be, unable to pay its liabilities as they become due; or

(d) the realizable value of the Corporation's assets, excluding the amount of any financial assistance in the form of a loan or in the form of assets pledged or encumbered to secure a guarantee, after giving the financial assistance, would be less than the aggregate of the Corporation's liabilities and stated capital of all classes.

6. NUMBER OF DIRECTORS

The number of directors within the minimum and maximum numbers provided for in these articles shall be as determined by resolution of the board of directors.

TABLE OF CONTENTS

1 SCOPE

This Contract Specific Environmental Protection Plan (C-SEPP) template shall be used to complete a C-SEPP by the Contractor and shall describe the Contractor's procedures and methods to be implemented during site activities to minimize pollution, protect and conserve natural resources, restore damage, and control noise and dust within reasonable limits. The C-SEPP must be accepted by both SLI and Nalcor, as part of the Work Plan, prior to the start of any on-site activities or mobilization to the site.

A Project Wide Environmental Protection Plan (P-WEPP) has been prepared and is part of the Contract Documents. The P-WEPP will serve as a resource to Contractors as they prepare their own C-SEPP. Select contract packages will include this C-SEPP template/outline and specific instructions on how the C-SEPP is to be properly completed. Contractors are responsible for developing, implementing, and maintaining their own C-SEPP.

The C-SEPP shall include the following information:

a) Description of construction sequence and work methods.

b) Roles and responsibilities.

c) Mitigation procedures for all areas of environmental concerns.

d) Procedures for environmental monitoring.

e) Maintenance requirements for environmental control structures.

f) Procedures for post-activity clean-up and demolition.

g) Contingency planning for environmental concerns.

The C-SEPP shall also include any permits, registrations or notifications required by Federal, Provincial or aboriginal stakeholders for the proposed activities. The Contractor may be required to prepare additional environmental documentation prior to any fieldwork for non-time critical removals. The Contracting Officer will determine the type of environmental documentation required at each site.

2 C-SEPP OUTLINE/PROPOSED TABLE OF CONTENTS

2.1 Contractor's Name

Provide name of company

2.2 Brief Description/Scope of Work of Contract

Include scope of work, methods of construction, etc.

2.3 Schedule of Work

Include a detailed schedule of work including sequence of activities (GANTT type chart).

2.4 Responsibilities

List all responsible personnel (i.e. Project Manager, Environmental Coordinator, Health and Safety Manager, Field Supervisor, Regulators, etc.) including work specific roles and responsibilities including accountabilities and qualifications and interface roles and responsibilities between Contractor and Subcontractors. A table similar to that shown below would be acceptable.

Name	Title/Responsibility	Contact Information

2.5 Emergency Contacts

List emergency contacts required for the protection of environmental and human health. A table similar to that shown below would be acceptable.

Name	Governing Agency	Title/Responsibility	Contact Information

2.6 Description of Resources

Identify resources required (personnel, facilities, equipment, consumables or other requirements) required to complete contract.

2.7 Installations Required

List any temporary or permanent installations such as bridges, culverts, cofferdams, settling ponds, etc.

2.8 Applicable Policies and Training

List any environmental policies, compliance procedures and rules for contractors and subcontractors to follow. Also list any environmental training, including site specific training available to employees, or managers, as well as subcontractors. Attach any applicable documentation regarding policies or training.

2.9 Site Specific Environmental Concerns:

List any potential environmental concerns and sensitive issues associated with specific construction activities. The items listed below must be identified and located, on a site plan or sketch that shall be submitted with the C-SEPP. In the case of linear developments, this shall be located on a plan and profile by kilometer markings (or structures in the case of transmission lines). The plan shall identify the following:

a) Endangered/threatened species or identified critical habitat within the project site.

b) Wetlands within the project site.

c) Cultural and archaeological resources within the project site.

d) Water resources (all water bodies or watercourses such as ponds, lakes, streams) within the project site.

e) Coastal zones within the project site.

f) Trees and shrubs that will be removed within the project site.

g) Existing waste disposal sites within the project site.

h) Timing restrictions regarding construction of various construction sites.

2.10 Plans

The following full plans are to be prepared:

a) Sedimentation and Erosion Control Plan

b) Rehabilitation Plan

c) Compliance Monitoring Plan

d) Dewatering Plan

e) Blasting Plan

2.11 General Environmental Protection Procedures

A complete list of activities requiring mitigation measures, as outlined in the P-WEPP is provided below (1 – 35). List or reference specific procedures and methods for environmental protection and mitigation as they apply to the specific contract. Note: all activities will not apply to all contracts.

1) Scheduling and timing of Construction Activities

2) Construction Entrance

3) Linear Developments

4) Winter Construction

5) Equipment Operations and Movement

6) Vessel Operations (Barge/Boats)

7) Helicopter Traffic

8) Clearing of Vegetation

9) Pumps and Generators

10) Surveying

11) Drilling

12) Surface Water and Groundwater Use

13) Storage, Handling and Disposal of Fuel and other Hazardous Materials

14) Sewage Disposal

15) Solid Waste Disposal

16) Working within 15 meters of a Body of Water

17) Watercourse Crossings – Fording, Culverts and Bridges

18) Buffer Zones

19) Alterations to a Body of Water/Instream Works

20) Working In/Around Marine Environmental

21) Grubbing and Disposal of Related Debris

22) Quarrying and Aggregate Removal from Borrow Areas

23) Trenching

24) Excavation, Backfilling and Grading

25) Erosion Prevention and Sediment Control

26) Site Water Management

27) Dewater Work Areas

28) Blasting and Waste Rock Disposal

29) Concrete Production

30) Dust Control

31) Noise Control

32) Resource Specific Mitigations

33) Commissioning

34) Reservoir Impoundment

35) Site Rehabilitation

The activities listed above coincide with Section 5.0 of the P-WEPP, and if applicable to the specific contract, they should be reviewed and included in the C-SEPP. The Contractor should confirm that they agree with the specific measure noted in P-WEPP Section 5 or propose an alternative for consideration.

2.12 Monitoring/Auditing

Describe any monitoring activities required. Monitoring may include surveillance monitoring, compliance monitoring, wildlife monitoring, etc. The following details should be included:

a) Analytical parameters and laboratory to be used for samples.

b) Sampling locations.

c) Frequency of sampling.

d) Reporting (frequency of reports and what to include).

e) Corrective Actions (how to identify, document and execute).

2.13 Environmental Contingency Measures

List specific environmental contingency measures to be implemented should the environmental protection procedures be unsuccessful in protecting the environment. Contingency measures should be included for the following:

a) Fuel and hazardous materials spills (including details on spill response equipment).

b) Forest fires (including details on spill response equipment).

c) Wildlife encounters and nuisance presence.

d) Discovery of historic resources.

a) Alternative protection procedures for erosion and sediment control and site water management (measures to be implemented in the event initial mitigations are not successful).

2.14 Permits, Registrations, Notifications, Approvals and Authorizations

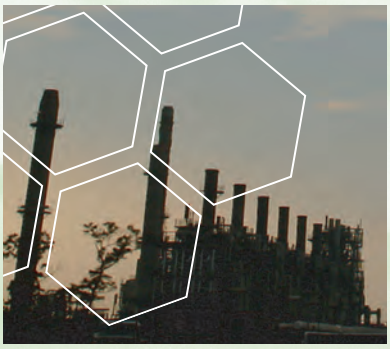
List all permits, registrations, notifications, approvals and authorizations that are required. A table similar to that shown below would be acceptable.

Required Registrations/Approvals/Permits/ Authorizations/Notifications	Issuing Department	Individual Obtaining Permit

2.15 Document Control

Provide details on document control methods.

Critical Risk Control Protocols



SNC·LAVALIN

about the health and safety of our employees, of those who work under our care, and of the people our projects serve.

SNC·LAVALIN

Winning the hearts and minds

of our people for safety requires each person to become a safety leader. These are leaders who inspire, motivate and transform others to excel in safety.

Emphasis on safety and quality on projects

which involves the integration of safety into all core business activities, the distribution of responsibility and accountability for safety to all employees at all levels and the adoption of peer-driven safety review processes.

Competence of the organization and people

in indentifying and managing risk requires a systematic focus on behaviours, risk perceptions and skills. Risk is inseparable from opportunity and reward and is to be managed competently at all levels of the organization.

Analysis of performance

while respecting lessons learned from previous experience, our focus is on sustaining a proactive safety culture. This includes processes like root cause analysis, positive incentive programs, safety leadership training, etc…

Risk transformation

ensures that the overall management of safety is risk-based, systematic and responsive to the dynamic nature of hazards and risks. We must stay vigilant and support processes which effectively assess all of our projects, business activities, and operations.

Engineering innovation for safety

reduces risks in project design, infrastructure, construction, and operations. It includes processes of quality management, lessons learned, e-technology, innovation, and benchmarking against best practices.

REVISION HISTORY

TABLE OF CONTENTS

INTRODUCTION

The Critical Risk Protocols are designed to provide those controls deemed necessary to prevent fatalities, serious incidents and injuries arising from the most common hazards associated with our business.

The existence of these Protocols does not provide coverage of all risk areas. Other risk areas are addressed through our risk management process , a key element of the SNC-Lavalin Risk Register Procedure.

CONTEXT

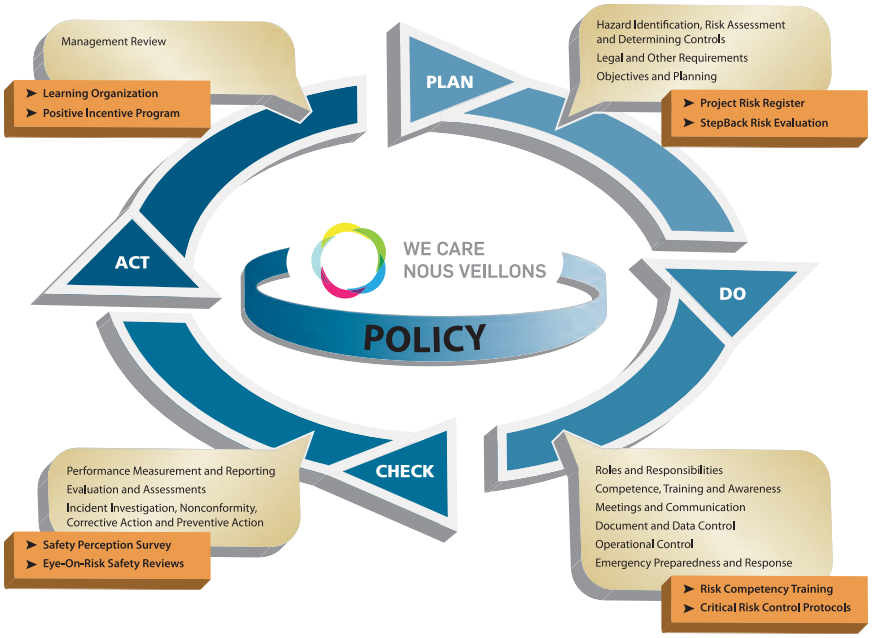
These Protocols should be read and used in conjunction with SNC-Lavalin Global Health and Safety Management System, Standards and Procedures. The SNC-Lavalin Global Health and Safety Management System as shown below is hierarchical, where documents and systems must meet and support the requirements of those at a higher level.

DEPLOYMENT

The mandatory requirements of these protocols are signified by the use of the word “shall”. The word “should” indicates that the primary intent is to comply with the full requirements as if they were mandatory. However, there will be circumstances where local conditions may demonstrate that the requirement is either not applicable or an alternative approach is necessary. Variation can only be considered as compliance if the most senior manager of the project approves it based on an evaluation of the risk. The risk management approach adopted must be consistent with the SNC-Lavalin risk management process and follow the hierarchy of controls.

APPLICATION

These protocols apply at all SNC-Lavalin controlled sites for controlled activities, and to all SNC-Lavalin employees, contractors and visitors when involved in these controlled activities.



HIERARCHY OF CONTROLS

The hierarchy of controls is the preferred order to mitigate hazards and control risk levels:

1. **Elimination:** Complete removal of a hazard.
2. **Substitution:** Replacing the material or process with a less hazardous one.
3. **Separation:** Isolate the hazard (e.g. guarding or enclosing it).
4. **Engineering:** Designs or modifications to reduce the exposure to the hazard.
5. **Administrative:** Limit exposure to hazardous conditions or energies by procedural means (e.g. timing of work, policies, signage and work practices).
6. **Personal Protective Equipment (PPE):** Last line of defence; hazards are still present and PPE is used to reduce the potential for harm.

A number of these options may be considered and applied individually, or in combination.

It is recognized that sound (and formalized) risk management principles are still required (e.g. beyond simple compliance with a mandatory Protocol) to identify, quantify, control and reduce the likelihood of incidents through the investigation, assessment and understanding of hazards associated with the activities covered by these Protocols.

SNC-Lavalin operates a diverse range of businesses in different countries and cultures around the world, all with varying legal frameworks. When applying procedures and practices to meet the needs of these Protocols, the relevant legislation must be complied with.

The nature of hazards and extent of risk may be significantly influenced by changes implemented to operations, processes, equipment, systems, services and people. This requires procedures to assess the effect of these changes and the associated risks. As with any formal risk management process, appropriate change management processes shall be in place.

APPROVAL FOR ALTERNATIVE CONTROLS

In unique circumstances where the specific requirements of a Critical Risk Control Protocol cannot be fully achieved, approval for alternative control measures shall be obtained by providing a comprehensive and documented risk-based management control plan, containing the following:

- Details of the Critical Risk Control Protocol conformance gaps;
- Alternative controls to be implemented;
- Timeframe and associated conditions towards achieving compliance;
- Assigned single point accountability; and
- Sign off by the “one up manager” to the most senior manager of the project.

MAINTENANCE OF CONTROLS

All controls require maintenance and monitoring. The monitoring and measuring of control effectiveness shall be instituted as part of the risk management process for all SNC-Lavalin controlled sites.

PROTOCOL 1 – VEHICLES AND MOBILE EQUIPMENT

1.1 INTENT

To eliminate or minimize the risk of fatalities, injuries and incidents arising from the use of vehicles and mobile equipment.

1.2 APPROACH

This protocol applies to all self-propelled vehicles and mobile equipment.

This protocol applies to all SNC-Lavalin controlled sites and activities, and to all SNC-Lavalin employees, contractors and visitors when involved in controlled activities. This protocol does not apply to employees personal vehicles. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented).

1.2.1 REASON FOR INCLUSION

Vehicles have been involved in a significant proportion of fatal and high potential incidents in the construction and mining industries. Identified causes and contributing factors include:

1. Inappropriate speed for conditions.
2. Driver fatigue.
3. Vehicle stability.
4. Driver distraction.
5. Vehicle condition (tires, brakes, etc.).
6. Alcohol and drugs;.
7. Poor visibility.
8. Lack of vehicle separation from other mobile equipment, objects and pedestrians.
9. Risk taking behaviour.
10. Driver experience/competency.

1.3 DEFINITIONS

- **Mobile equipment** includes vehicles such as bobcats, front end loaders, forklifts, dump trucks, tractor trailers, packers, etc.

- **Light vehicles** includes vehicles such as passenger cars, four wheel drives (including all wheel drives), sports utility vehicles (SUVs), cargo vans, pick-ups (utilities), mini buses, etc.
- **Heavy equipment** includes vehicles such as bull dozers, rock trucks, excavators, graders, etc.

1.4 DEPLOYMENT

Please refer to the deployment section on page 3 for definition and explanation, and approval for alternative controls.

The requirements of this protocol are as follows.

1.4.1 GENERAL REQUIREMENTS

1. Maintain and operate all vehicles in accordance with manufacturer's specifications.

2. Safe work plans shall be in place to ensure that risks associated with servicing vehicles are managed and controlled. The systems shall include, but are not limited to, primary and secondary stands specifically manufactured for the support of vehicles or mobile equipment when support for mobile equipment is required.

3. Vehicle selection shall be based on a documented risk assessment process, taking account of tasks, suitability for job application, environment and roll over and crash worthiness ratings.

4. Tires specifically designed for the hazardous road conditions, including tires designated for winter driving during the season when snow or ice can be expected.

5. In instances where SNC-Lavalin staff must use short-term rental vehicles, all efforts should be made to comply with these protocols. Where it is not possible to comply (e.g. winter tires), alternate controls should be utilized (e.g. rental of four-wheel-drive vehicle).

6. Prior to allowing vehicles not specifically designed to dump their loads from uneven surfaces to dump, supervision must ensure that the vehicle is on firm/level ground.

7. All installed and required safety equipment such as seat belts, air bags, emergency stopping system, parking brake and audible back-up alarms shall be used at all times when the vehicle/equipment is in use.

8. Before the operator exits a vehicle the parking brake must be set and the ignition turned off.

9. Circle checks must be completed to ensure safe movement of vehicles prior to use.

10. When the vehicle is parked on an incline and as applicable to the type of equipment, the wheels must be blocked, the blade/forks/bucket lowered or the wheels turned into a berm or other obstruction.

11. Light vehicle running lights (low beam headlamps) shall be on at all times when the vehicle is in operation.

12. Mobile phones, whether hands-free or hand-held, shall not be used by the driver of a vehicle unless the vehicle is stationary and in a safe location.

13. Controls shall be in place to ensure the safety of people working in traffic areas, including working on unexpected vehicle breakdowns.

14. To allow forward egress into traffic areas and improve safe movement of traffic, in our parking lots at our office and project sites, all vehicles should back into parking spaces where appropriate.

15. A fit-for-work policy shall be in place, incorporating defined action levels for drugs (including prescribed medication) and alcohol and procedures for managing driver fatigue

1.4.2 PROJECT EQUIPMENT REQUIREMENTS

All road going vehicles shall have the following minimum safety features:

1. Vehicles carrying passengers shall have suitable seats with seatbelts (no seat, no ride) and shall not have seating that is side mounted. Passengers may be permitted without appropriate seats if it has been authorized for training or for inspecting the equipment, but only if adequate provision has been made for the safety of the passenger.

2. Roll-over protection is required for all vehicles where the risk of roll over is high.

3. Cargo barriers and load restraints for all vehicles designed for carrying loads (other than passengers), or that are unable to have cargo separated from the vehicle's occupant carrying space.

4. A first aid kit suitable for road emergencies.

5. Emergency roadside triangles or beacons (three of either).

6. Driver frontal airbag and passenger airbag (for light vehicles).

1.4.2.1 INTERACTION WITH HEAVY EQUIPMENT

All vehicles that interact with heavy mobile equipment shall:

1. Have means that enable communication to be made with that equipment.

2. Have a flashing, revolving or strobe light or for light vehicles reflective taping and a high-visibility flag (e.g. a whip flag or buggy whip).

3. Ensure vehicles with poor visibility, oversized loads, operating in tight quarters or other high risk situations are moved with the assistance of a signal person (spotter).

1.4.3 MOBILE EQUIPMENT

Mobile equipment shall have:

1. Seatbelts for all occupant seats.
2. Roll over protection where there is risk of roll over.
3. Falling object protection unless the risk of falling objects is low.
4. A suitably mounted portable fire extinguisher.
5. Lights for safe operation.
6. Horn or other audible warning device.
7. Reverse alarm (except for bi-directional vehicles such as shuttle cars).
8. Isolation point (see Protocol 4 – De-Energization, Isolation, Lock-Out and Tagging) that can accept a personal lock.
9. Wheel chocks for rubber tired mobile equipment.

1.4.4 EQUIPMENT INSPECTION

1. Inspect vehicles at the start of each shift and complete a pre-shift vehicle/equipment checklist and keep the checklist on the vehicle for that shift.
2. Prior to acceptance and use of heavy and mobile equipment on site, a mechanical inspection must be carried out and a copy of the inspection forwarded to the appropriate SNC-Lavalin personnel.
3. Ensure that a formal, effective and auditable preventive maintenance program is established for all vehicles and mobile equipment.
4. Immediately tag and lock vehicles out of service that have been found to have defects that pose a hazard to safe operation.

1.4.5 MODIFICATION OF EQUIPMENT

Stamped engineering documents shall accompany all vehicle/mobile equipment modifications, including the attachment of any equipment. Examples of changes or modifications may include, but are not be limited to:

1. Any change or modification made to the overall vehicle body structure or design.
2. Any change or modification made to the original manufacturer's required or suggested type of tires or wheels.

3. Any change or modification made to the vehicle suspension system, mechanical system, or lifting capacity.

4. Any change or modification that may adversely alter the vehicle's centre of gravity.

5. Any change or modification that may affect the vehicle's load carrying capacity.

6. Any change that may affect the vehicle's crash-worthiness or the effective operation of any vehicle feature.

1.4.6 JOURNEY MANAGEMENT PLANS

Journey management plans are required anytime employees are required to travel:

1. More than 400 km or 4 hours.

2. In areas that pose safety and security risks due to political or social instability.

3. In unpopulated areas with limited communication ability.

4. In areas where conditions make the travel more hazardous:
   a) extensive travel on unpaved or unmaintained roadways.
   b) high levels of wildlife interactions.
   c) mountainous areas.
   d) dangerous seasonal or extreme weather conditions.

Systems shall be in place to ensure that risks associated with vehicle journeys are managed and controlled. The systems should include, but not be limited, to:

1. Journey management plans in place prior to commencement of new or changed travel activities.

2. Identification and monitoring of the risks associated with the number of journeys, routes, intersections, etc. To ensure that the overall exposure is reduced to as low as reasonably practicable.

3. The need for survival or emergency equipment suitable for the operating environment.

4. Assessment and communication of changed environmental and road conditions at the time of travel.

5. Outline of actions required in the event of an emergency (e.g. collision or break down).

6. Provisions to manage driver fatigue.

7. When traveling long distances or in remote areas alone, a check-in schedule is established with a contact person who knows how to respond if a problem develops.

1.4.7 TRAFFIC MANAGEMENT PLANS

An assessment needs to be completed to see if there are any traffic hazards at a given project, and if so a site-based traffic management plan shall be in place including, but not limited to the following:

1. A traffic control person (spotter) is required any time a large vehicle is backing up on a construction site, any vehicle that is backing up into a congested area, and any time project equipment interacts with the public to ensure a clear and safe path of travel. This person shall have sufficient documented training to complete this task.

2. Setting of appropriate speed limits for vehicle types, road surfaces and environmental conditions.

3. Overtaking protocol.

4. Procedures for light vehicles entering hazardous or restricted areas.

5. Clear communication protocols.

6. Standards for safe following distances based on operational circumstances, environmental conditions and near sight (blind spot) limitations of other mobile equipment.

7. Installation and maintenance of road traffic control signs as appropriate to the work site.

8. Parking procedures (e.g. safe parking distances/locations) and required barriers from heavy mobile equipment and pedestrians.

9. A site-based review of pedestrian interaction, road design and layouts (including entrance and exit points, intersections and other potential points of interaction between vehicles and other mobile equipment), shall be conducted and updated when changes to layouts are required. Where possible, traffic segregation should be used to separate pedestrians, light vehicles and other mobile equipment.

10. Any changes to the site traffic management plan shall go through a change management review.

1.4.8 PEOPLE REQUIREMENTS

1. All employees, contractors and visitors shall be inducted in appropriate site road safety and vehicle hazards.

2. A system shall be in place to verify that drivers of heavy and mobile equipment have a valid and appropriate level of public road driver's license prior to being allowed to operate vehicles/ equipment off site. Where applicable, vehicle operators shall have their license on their person at all times.

3. A permit or certification system shall be in place to ensure drivers/operators are competent to operate vehicles in their intended environment, whether that be internal or external to a

SNC-Lavalin site. Only qualified personnel or personnel in training under direct supervision are permitted to operate equipment.

4. As a minimum training should include:
   a) hazards assessed for a particular vehicle and the task for which it is to be used.
   b) specific road/project site rules.
   c) vehicle familiarization, taking into account the vehicles handling dynamics, blind spots and various features.
   d) loading and restraining principles where the vehicle intended to be operated is designed for carrying cargo loads.
   e) education and awareness of driving and travel risks that may be encountered within the environment where the vehicle may be operated or driven.
   f) emergency crash and breakdown procedures, basic mechanical principles including tire changing and how to adequately perform a pre-operation check.
5. Where suitable, the SNC-Lavalin Positive Incentive Program should be used to reinforce safe driving practices.

PROTOCOL 2 – HAZARDOUS MATERIALS MANAGEMENT

2.1 INTENT

To eliminate or minimize the risk of fatalities, illnesses, injuries and incidents arising from the storage, handling, production, transport, recycling and disposal of hazardous materials.

2.2 APPROACH

This protocol applies to hazardous materials that, in one or more of their forms (solid, liquid or gas), have the potential to harm our people, the environment, or our communities (all stakeholders), either in an accident involving loss of control/containment, or in normal, controlled activities (e.g. storage, handling, production, transport, recycling and disposal). This protocol does not cover handling of explosives or radioactive materials.

This protocol applies to all SNC-Lavalin controlled sites and controlled activities, and to all SNC-Lavalin employees, contractors and visitors when involved in hazardous materials operations. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented.)

2.2.1 REASON FOR INCLUSION

Hazardous materials have contributed to the number of incidents in the construction and maintenance industries. They are generally associated with uncontrolled releases and have the potential to affect a wide area around the incident (e.g. gases can travel significant distances). It is therefore necessary to ensure that equipment, processes, and behaviours are developed and adopted that will manage the risk associated with these materials. The causes and contributing factors to these incidents have been:

1. At-risk maintenance activities.
2. Lack of understanding of chemical properties and reactions.
3. At-risk manual handling activities.
4. Insufficient management of risk.
5. Equipment failure.
6. Insufficient primary and secondary containment systems.

2.3 DEFINITIONS

- **HAZOP** stands for **HAZ**ard and **OP**erability study.
- **HAZID** stands for **HAZ**ard **Id**entification.
- **MSDS** stands for **M**aterial **S**afety **D**ata **S**heet.
- **HAZCHEM** stands for **HAZ**ardous **CHEM**ical.

- **ALARP** stands for **A**s **L**ow **A**s **R**easonably **P**racticable.
- **HAZMAT** stands for **HAZ**ardous **MAT**aterials

2.4 DEPLOYMENT

Please refer to the deployment section on page 3 for definition and explanation, and approval for alternative controls.

The requirements of this protocol are as follows.

2.4.1 FACILITIES, PROCESS AND EQUIPMENT REQUIREMENTS

1. Provisions shall be made for the safe venting, drainage and containment of hazardous materials, where required by normal operations, maintenance and repair activities, and emergency situations. These provisions should be based on a formal risk assessment process, such as HAZOP or HAZID studies, and take into consideration any applicable environmental legislation.

2. For toxic gas release, an adequate model of dispersion shall be available for credible scenarios, in order to determine the zone of exclusion and adequate containment area for impacted personnel.

3. Labelling shall be in place on all storage vessels, containers and tanks, as per appropriate local or applicable CSA standards. This labelling shall clearly identify the carried or stored material. Supporting information (e.g. material safety data sheets [MSDS]) shall also be readily available at the point of use and storage locations.

4. Piping containing hazardous substances shall be marked such that the contents and direction of flow of the piping can be identified.

5. Security and access control systems and hardware shall be in place, appropriate to the risk, to manage access to areas where hazardous materials are stored and used. These areas must also be designed for easy access for firefighting and emergency response efforts. Storage facilities must protect hazardous materials containers from physical damage due to factors such as, but not limited to, extreme temperatures, moisture, corrosive mist and vapours, and vehicles.

6. Fixed and personal detection devices shall be considered as options in the selection of potential risk reduction measures. These are the redesign and separation controls, and personal protective equipment as described in the Hierarchy of Controls.

2.4.2 PROCEDURAL REQUIREMENTS

1. The requirements of relevant OH&S legislation, regulations, standards and industry codes of practice shall be applied.

2. A program must be in place to assess safer alternatives to current hazardous materials based on risk assessment and also consider product and process reformulation/redesign actions where technically feasible.

3. Optimization practices must be designed to minimize the inventory of hazardous materials to necessary amounts for justifiable use.

4. A risk management process shall be in place for all hazardous materials to identify:
   a) the selection criteria and lifecycle analysis for all hazardous materials, including the means of disposal.
   b) the level of risk associated with the hazardous materials.
   c) controls required to manage the risk to levels that are ALARP.
   d) the performance requirements (reliabilities and capacities) of specific equipment and systems included in these controls.

5. All facilities which have high levels of risk from hazardous substances shall provide an emergency response plan which includes:
   a) means of escape in an emergency situation.
   b) emergency response teams appropriate to the risk.
   c) appropriate number and location of safe refuge and assembly areas for people.
   d) emergency response equipment for spillage containment, fires, explosions, burns, etc.
   e) appropriate response arrangements with external medical providers (e.g. ambulance, hospitals, fire brigade etc).
   f) emergency response procedures appropriate to the risk; and theoretical and practical training of involved personnel.
   g) recovery procedure and disposal of the hazardous material.

6. A system shall be in place whereby the introduction and disposal of hazardous materials, including empty containers, shall be approved by the site Hazardous Materials Co-coordinator (refer to requirement number 2.4.3.1 of this protocol) prior to introduction or disposal.

7. A site register shall be in place for all hazardous materials, and includes:
   a) name;
   b) HAZCHEM/United Nations code;
   c) MSDS;
   d) summary of maximum inventory;
   e) storage requirements and precautions;
   f) location, physical properties of the materials, where they are used; and
   g) approved disposal methods.

8. A system shall be in place to ensure that MSDS are readily available to all personnel (employees, contractors and other affected parties such as first aiders and medical personnel) involved in

the transportation, storage, handling, use and disposal of hazardous materials and be in the language commonly used at the site.

9. A system shall be in place to ensure that all relevant design documents and drawings associated with this protocol are up-to-date, controlled and available.

10. Critical activities involving hazardous material, which have the potential for immediate or long-term harm, shall be identified and safe operating procedures and training documented, including selection, transportation, storage, handling, and use and disposal of incompatible hazardous substances.

11. Monitoring systems for hazardous materials shall be in place to ensure that the status of process operations is understood and shown clearly at all times. These systems shall include the procedure for a documented hand-over between shifts that records any relevant information/ changes in operating status.

12. A permit to work system shall be in place to ensure proper decontamination of land, facilities, and equipment, isolation, use of the correct personal protective equipment, and any special requirements or precautions (e.g. requirements for venting, clearing of piping or when using open flames) where the occupational exposure limit of a hazardous substance could be exceeded.

13. Documented emergency response plans for incidents involving hazardous materials shall be in place, reviewed, revised (if necessary) tested annually. This shall include external support services such as local ambulance and hospitals as appropriate to the risk.

14. A system shall be in place to authorize and control the training of appropriate personnel in normal transportation, storage handling, use and disposal of, and emergency response procedures for hazardous materials.

15. A system shall be in place to monitor short and long-term exposure of personnel to hazardous materials, whenever there is the potential for immediate or long-term harm. This system shall ensure that fatality potential is also addressed.

16. Procedures shall be in place for transporting hazardous materials. Where required, a hazardous material manifest and supporting documentation shall be completed and shipped with the hazardous material. This documentation shall comply with local legislation and be readily available to be audited by SNC-Lavalin.

2.4.3 PEOPLE REQUIREMENTS

1. The role of a site Hazardous Materials Coordinator shall be required at sites where hazardous materials are processed, stored and handled. This person shall be competent to understand and evaluate the risks associated with hazardous materials. The individual shall be responsible for assessing the hazardous properties and authorizing the use of hazardous materials on site, as well as dictating any required controls to be implemented prior to use.

2. A competency based training program shall be in place for operations, maintenance and emergency response roles involving hazardous materials.

3. Behaviour based observations shall include the operation of equipment and systems handling hazardous materials.

2.4.4 SAFETY IN DESIGN

1. The design of a facility or process, permanent or temporary, which transports, produces, stores, uses or disposes of hazardous materials shall be reviewed, amended as necessary and documented utilising adequate risk analysis methods and tool. As-built design drawings (e.g. process and instrumentation diagrams, process flow diagrams, layout drawings, isometrics, etc.) shall be updated as a result of these reviews.

2. All specifications for the design and/or modification of hazardous materials facilities shall be subject to a risk analysis that includes hazardous materials selection, transport, production, storage, handling, use and disposal. Previous incidents should be reviewed to ensure risk is as low as reasonably practicable (ALARP). Identified hazardous situations and associated risks will be recorded in the Project HSE Risk Register using Risk Management Tool.

3. Process control systems shall ensure that the potential for personnel to be exposed to hazardous materials is eliminated wherever possible or reduced to ALARP.

4. Automatic project control systems should be in place in hazardous material facilities to eliminate the need for operator intervention and maintain operation within the required parameters. Such systems shall incorporate fail to safe systems in the event of emergencies. Where automatic control is not practicable, risk assessment shall be used to identify and implement operational options that reduce health, safety and environment risks to ALARP.

5. A system shall be in place to identify and document the selection, use, maintenance, inspection, testing schedules and procedures for critical equipment associated with hazardous materials.

6. A system shall be in place for the management of change of equipment and/or processes for selection, transportation, storage, handling use and disposal and shall include specific steps to assess the impact of changes on the risk associated with hazardous materials.

7. Safe operating limits for equipment handling hazardous materials, which have the potential for immediate or long-term harm, shall be clearly defined, documented and available to operations and maintenance personnel.

8. A system shall be in place to control simultaneous operations involving hazardous materials to avoid mixing of incompatible materials.

PROTOCOL 3 – EQUIPMENT SAFEGUARDING

3.1 INTENT

To eliminate the risk of fatalities, and injuries when there is potential for human interaction with moving parts of potential energy releases of machines and equipment.

3.2 APPROACH

This protocol applies to the safeguarding of people from moving parts, mobile machines, equipment and power tools, including moving equipment, high pressure equipment and applications, electrical, other energy sources with the potential to move, and objects falling or projected from moving parts.

This protocol applies to all SNC-Lavalin controlled sites and activities, and to all SNC-Lavalin employees, contractors and visitors when interfacing with equipment. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented).

3.2.1 REASON FOR INCLUSION

A number of high potential incidents have been associated with the inadequate and inappropriate safeguarding of equipment. The causes and contributing factors to these incidents have been:

1. Absent, inadequate or ineffective guarding in place.
2. Working alongside unguarded moving parts.
3. No process assessment to identify guarding needs.
4. Struck by objects projected from moving parts.
5. Struck by equipment mobilized by high pressure equipment (e.g. hydraulics, compressed air).
6. Working on moving parts with guarding removed.
7. Lack of guarding interlocks on potential/high equipment.

3.3 DEFINITIONS

N/A

3.4 DEPLOYMENT

Please refer to the deployment section on page 3 for definition and explanation, and approval for alternative controls.

The requirements of this protocol are as follows.

3.4.1 PROJECT AND EQUIPMENT REQUIREMENTS

1. Designers and purchasers of new equipment shall consider all energy sources and ensure that they are designed to eliminate the need for guarding where practicable. Safeguarding shall be selected where other potential mitigation measures do not adequately protect personnel.

2. Equipment safeguards shall be designed and constructed to comply with applicable legislation, CSA standards, codes of practice and relevant recognized leading industry practices and considering maintainability and operability.

3. Prior to allowing personnel into an operational or construction environment, a formal evaluation shall be made to ensure the integrity of equipment safeguarding.

4. Where safeguarding and interlock systems are insufficient to protect people, access to equipment shall be controlled and monitored.

5. Fail-to-safe/deadman switches or devices shall be installed on all manually operated rotating equipment and power hand tools (e.g. saws, lathes, drill presses, etc.).

6. Guards shall only be removed for maintenance and repair after equipment has been isolated, locked out and tested in line with Protocol 4 – De-Energization, Isolation, Lock-Out and Tagging. Where the temporary removal of safeguards is necessary on operating equipment, for the purposes of fault finding, testing and commissioning, a risk-based procedure shall be in place. Guards shall be replaced prior to equipment being put back into operation.

3.4.2 PROCEDURAL REQUIREMENTS

1. The requirements of relevant OH&S legislation, regulations, standards and industry codes of practice shall be met.

2. A documented assessment process shall be used to identify where safeguarding is required on equipment and to identify safeguarding hazards that require interlock systems as an additional control where required.

3. No guarding shall be modified or altered except through the application of a risk-based change management process and if applicable, sign-off by a professional engineer.

3.4.3 PEOPLE REQUIREMENTS

1. People likely to come into contact with high-energy moving and rotating parts, shall be required to have competency based training including what the risks are, what the controls are, emergency management and incident response procedures and where to get further information, if required.

2. A training system that includes the requirements of this protocol shall be in place for relevant personnel involved in the design, purchase, construction, operation and maintenance of equipment.

3. Only appropriately competent people are allowed to work with high-energy moving and rotating parts and they must be instructed and supervised by appropriately competent people.

PROTOCOL 4 – DE-ENERGIZATION, ISOLATION, LOCK-OUT AND TAGGING

4.1 INTENT

To eliminate or minimize the risk of fatalities, injuries and incidents arising from the uncontrolled and unexpected release of energy or hazardous materials.

4.2 APPROACH

This protocol applies to the isolation of all sources of energy (electrical, mechanical, hydraulic, chemical, gravitational, pneumatic, kinetic, stored energy, etc.).

This protocol applies to all SNC-Lavalin controlled sites and activities, and to all SNC-Lavalin employees, contractors and visitors when working with all potential sources of energy. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented).

4.2.1 REASON FOR INCLUSION

Failing to lock out an energy source can create an immediately dangerous to life and health situation. A high portion of energy related incidents are caused by inadequate or improper isolation of the energy sources. The causes and contributing factors to these incidents have been:

1. Failure to identify or recognize a source of potential or stored energy.
2. Inadequate training or competence.
3. Inadequate lock-out/tag-out systems.
4. Complacency.
5. Working on, or isolation of the wrong equipment.
6. Inadequate design/maintenance of isolators.

4.3 DEFINITIONS

- A system or isolation tag is a **tag** applied to an isolation point by the person who is responsible to ensure isolation requirements for the task have been met and is a tag that when applied prohibits all use, operation or start-up of equipment.
- **Routine** work is work that does not require a permit and is covered by a procedure, work instruction or checklist.
- **Non-routine** work is any activity that is outside regular operation of the construction site or a site which we may be operating. Non-routine work can involve an activity where more than one energy source has to be isolated.

- A **group isolation** is achieved when there is a single common isolation point that isolates more than one unit of equipment.
- A **multiple isolation** is a single isolation point that is locked and / or tagged by more than one person.
- A **short-term isolation** is an isolation in place for one shift period or less.
- A **long-term isolation** is an isolation in place for more than one shift period.
- **Software overrides** are those that either electronically set and hold a device or electronically defeat an output action for emergency and safety shutdown systems. Their functions are electronically initiated and applied to control rather than power circuits.
- **Personal locking device** is one that is provided to an individual for the purpose of their own protection. It is not to be used by others, and can only be removed by the owner. The only exception is the site master key that can be used by the construction manager or his/her designate, or the manager in charge of the facility we are operating.
- **Personal danger tag** is a tag personally applied by the individual prior to commencing work on isolated equipment. The individual who placed the personal danger tag on the isolated piece of equipment is the only person who can remove the tag. The only exception for removal of the tag by others is when the construction manager or his/her designate, who after ensuring the individual has left the site or facility we are operating, has given approval.

4.4 DEPLOYMENT

Please refer to the deployment section on page 3 for definition and explanation, and approval for alternative controls.

The requirements of this protocol are as follows.

4.4.1 PROJECT AND EQUIPMENT REQUIREMENTS

1. Purchase and design of equipment (including hired and contracted equipment) shall be given due consideration to meeting the requirements of this protocol.

2. Isolation shall provide positive protection and be achieved by the use of locking devices or the establishment of a physical barrier or separation. All separations or physical barriers shall be provided with either a permanent or temporarily fitted locking device.

3. Personal locking devices shall:
   a) be uniquely keyed.
   b) not be combination locks.
   c) not have an unauthorized second-party master override key.
   d) be kept under the exclusive control of the owning individual, and key(s) shall not be transferred to another person for lock removal.

4. Designated isolation points shall be clearly labelled at all times to identify the circuit or system

over which they have direct control. These labels shall be applied following a process of preisolation identification using isolation lists, load verification, marked drawings etc. (where permanently applied, these labels shall be physically verified prior to the isolation).

5. Lockout boxes, stations or equivalent shall be provided where required.

6. All designated isolation points fitted with personal locking devices shall be tagged. The isolation tagging system shall ensure that:
   a) isolation points are positively identified, including the name of the person locking out.
   b) the reason for the isolation is clearly identified.
   c) the date and time the tag was applied.
   d) isolation tags are highly visible to prevent inadvertent operation.

4.4.2 PROCEDURAL REQUIREMENTS

1. The requirements of relevant OH&S legislation, regulations, standards and industry codes of practice shall be followed.

2. All sites shall have a documented isolation lock-out and tag-out system. An overall site specific isolation and lock-out procedure shall be in place, and include:
   a) definitions of appropriate treatment for routine isolations (e.g. maintenance activities for construction equipment).
   b) non-routine isolations (construction activities).
   c) group, master and/or multiple isolations.
   d) short-term isolations and long-term isolations (“mothballing” procedures are only required prior to such activity).

3. No work can be done on any equipment or system until it has been established that it is in a zero energy state (ZES), unless involved in commissioning or troubleshooting. If it is not possible to establish a ZES on electrical systems, then the working live requirements of CSA Z462 must be followed.

4. The isolation system shall be applied to all activities on site, including contractor activities (e.g. construction, commissioning, operation of fixed/permanent equipment where applicable, operation, maintenance, return to service, emergency, modification or demolition of equipment).

5. The isolation procedure should determine the appropriate isolation method for any activity, either by way of a full description for specific cases, or by demonstrating the process that shall be followed to achieve the appropriate level of isolation in new activities. This shall include, but not limited to:
   a) the role of work instructions, checklists, tagging requirements and the permit to work system.

b) a positive registration process for people working on isolated equipment (personal tag, log sheet etc.).

c) changed requirements associated with the duration of the isolation and tasks, or when tasks take longer than planned to complete.

d) energy sources to be isolated (hazardous materials, mechanical, electrical, etc.).

e) the physical state of the energy sources such as their phase (liquid, solid, vapour, etc.) and other characteristics (e.g. pressure, temperature, voltage, etc.).

f) controls required for the duration of the activity (temporary changes, emergency procedures, personal protective equipment, etc.).

g) the requirements for formal contact with representatives in charge of each facility area affected, and the process for granting written authorization to proceed.

h) special precautions when isolations cover one or more shift changeovers.

6. Prior to relying on an isolation to supply a safe working environment documented test procedures shall be provided to verify isolation integrity including, but not limited to, the following principles:

   a) identification of all energy sources or hazardous materials directly and indirectly associated with the work to be performed.

   b) confirmation of those systems requiring isolation.

   c) notification of affected employees.

   d) isolating the confirmed energy or hazardous material sources.

   e) application of lock/tag.

   f) application of isolation tag.

   g) trying/testing of all systems and non-redundant isolations when reasonably or feasibly possible (to verify the integrity of the isolation and ensure a zero energy state exists), and restart procedures.

7. A formal procedure shall be in place for controlling clearances to work for the:

   a) isolation and de-isolation of equipment.

   b) handover and hand back of equipment between operation, and maintenance.

   c) transfer of isolations between shifts or different workgroups.

8. Specific procedures shall be developed to address software overrides.

9. A procedure for testing and positioning during maintenance and set-up.

10. A procedure shall be in place to mitigate hazards in special cases where any one of the following is not achievable:

a) a zero energy state.

b) a test/try of isolation is not possible.

c) use of a locking device is not feasible.

11. Formal isolation procedures shall include requirements for investigation, reporting and removal of personal locks/tags by an authorized person other than the originator.

12. The isolation system shall be regularly reviewed and audited to capture any previously unidentified changes and revised when necessary.

4.4.3 PEOPLE REQUIREMENTS

1. Roles and responsibilities for electrical, mechanical, or process isolation management shall be defined.

2. A competency based training system and field assessment shall be in place to approve personnel before they conduct isolation processes.

PROTOCOL 5 – WORKING AT HEIGHTS

5.1 INTENT

To eliminate or minimize the risk of fatalities, injuries and incidents arising from working at heights.

5.2 APPROACH

This protocol applies wherever there is potential for any person to fall 1.8 metres or more, or to gain access to within 1.8 meters of an open edge from where there is the potential to fall 1.8 metres or more, including working from various forms of portable and moveable elevated work platforms, cages, ladders, scaffolding and where objects could fall and cause injuries. Risk assessment may identify high potential fall hazards when working at heights of less than 1.8 metres in which case this protocol shall be applied. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented). This protocol does not apply to rope rescue situations and rappelling that are regarded as specialist functions.

This protocol applies to all SNC-Lavalin controlled sites and activities, and to all SNC-Lavalin employees, contractors and visitors when involved in work at heights.

5.2.1 REASON FOR INCLUSION

Falls from heights have contributed to a significant proportion of our fatal and high potential incidents. The causes and contributing factors to these incidents have been:

1. Failing to wear a harness.
2. Lack of job planning and job assessment.
3. Wearing the wrong type of harness.
4. Unstable set-up of elevated work platforms.
5. Wearing the harness incorrectly.
6. Unguarded or unbarricaded hole, edges, voids, excavations or walkways.
7. Absent or insufficient training.

5.3 DEFINITIONS

- **Fall prevention** means the design and use of a fall prevention system such that no exposure to an elevated fall hazard occurs. This may require more than one fall prevention system or a combination of prevention or protection measures.
- **Fall restraint** means an approved device and any necessary components that function together to restrain a person in such a manner as to prevent that person from falling to a lower level.

- **Fall arrest system** means the use of multiple, approved safety equipment components such as body harnesses, lanyards, deceleration devices, drop lines, horizontal and/or vertical lifelines and anchorages, interconnected and rigged, as to arrest a free fall.
- **Fixed lanyard** is a line used as part of a lanyard assembly to connect a harness to an anchorage point or a static line in situations where there is risk of a fall.
- **Inertia reel** (also known as a self-retracting lanyard or fall-arrest block) is a mechanical device that arrests a fall by locking onto a drop line and at the same time allows freedom of movement.
- **Suspension trauma** is the effect that can occur when a person's legs are immobile in an upright posture for a prolonged period, after an arrested fall with a fall-arrest system. The person is suspended and caught in an upright, vertical position and the harness straps cause pressure on the leg veins. The blood flow to the heart is reduced, resulting in fainting, restriction of movement or loss of consciousness. This may lead to renal failure and eventually death, depending on a person's susceptibility. The condition may be worsened by heat and dehydration.
- **Barricading** is defined as a physical barrier that prevents inadvertent access to an area (e.g. handrails, access doors and gates or similar installations, temporary or permanent). Barrier tape does not qualify as barricading.
- **Demarcation** is defined as any method that indicates that an area is used for a specific purpose or that access is restricted. Examples are barrier tape, painted lines on floor surfaces, portable signs denoting drop zones or no access past a specific point.

5.4 DEPLOYMENT

Please refer to the deployment section on page 3 for definition and explanation, and approval for alternative controls.

The requirements of this protocol are as follows.

5.4.1 GENERAL REQUIREMENTS

1. The requirements of relevant OH&S legislation, regulations, standards and industry codes of practice shall be followed.

2. The risk of fall shall be eliminated where reasonably practicable utilizing the Hierarchy of Controls.

3. Fall restraint and arrest systems shall be the consideration when it is not practicable to install fall prevention systems.

4. Standard work procedures shall be in place for the correct wearing and use of personal fall arrest and fall restraint equipment.

5. All personnel who are at risk of falling over 1.8 metres or have an unusual risk of injury at a lower height shall wear a safety harness with a shock-absorbing lanyard, unless the shock absorber will allow the worker to hit the ground or equipment below. The lanyard must be attached to a secure anchorage at all times while the person is in an exposed position. This may necessitate

the use of two lanyards so that one can be attached while the second is being moved to the next anchorage (facilitating 100% tie-off).

6. A self-retracting life-line (SRL) may be used in place of a shock-absorbing lanyard if used in accordance with manufacturer specifications.

7. Due to the detrimental effect on their safe working capacity, lanyards must not be hooked back onto themselves, unless specifically designed to do so.

8. All safety harnesses, lanyards, attachment slings and devices shall be inspected monthly in accordance with the manufacturer's recommendations and a record maintained of such inspections. Any harness found to be defective shall be tagged "do not use" and/or destroyed immediately.

9. Personnel using fall protection equipment shall visually inspect their safety harnesses and lanyards prior to use.

10. Personally owed fall protection equipment is not preferred for use on any project; however, under special circumstances it will be considered on a case-by-case basis, at the discretion of SNC-LAVALIN Safety Management. All personally owed fall protection equipment, if approved for usage on the project, must follow the same inspection requirements as defined for the project equipment.

11. All floor openings shall be protected by secure covers capable of supporting a point load in any part of the cover, or shall be fully barricaded is any fall hazard exists. Covers must be labelled accordingly.

12. A documented risk assessment shall be conducted before the commencement of work at height and at any time the scope of work changes or the risk of a fall increases. The risk assessments shall include:

    a) consideration for the potential of objects, as well as personnel, to fall.

    b) selection of appropriate control measures using the Hierarchy of Controls.

    c) the possibility for weather and other environmental conditions to influence the working conditions (e.g. wind, rain, snow, dust, gases, poor lighting, temperature, etc.).

    d) selection of appropriate equipment.

    e) selection of anchor and tie off points.

    f) condition of supporting structures such as roofs.

    g) selection of appropriate barricading and / or demarcation.

    h) fall clearances (e.g. length of lanyard + tear-out distance + height of user + safety margin).

    i) selection of first-man-up systems.

13. All fall protection and rescue equipment shall be fit-for-purpose and undergo pre-use checks. A documented inspection shall be completed by a competent authorized person once every six months (biannually) at a minimum. An equipment register and tagging system shall be in place

to indicate compliance with this inspection. Testing shall be done in accordance with the intent and requirements of the applicable CSA standards.

14. Where the work method requires persons to detach and re-attach at height, a dual lanyard system (100% tie-off) shall be utilized to ensure that at least one connection point is maintained at all times.

15. Where the use of personal fall arrest equipment is required, a person shall not work alone and there shall be other personnel in the vicinity that can raise the alarm immediately should emergency assistance be required.

16. The written site emergency response plan(s) shall include plans for the rapid retrieval of personnel in the event of a fall from height (e.g. response time is critical if a person is to avoid suspension trauma).

17. A system should be in place to prevent tools, materials and other objects from falling from height.

18. An assessment of the possibility of falling objects must be completed and appropriate controls be put into place. Controls may include, but are not limited to barricading, warning signs, tethering tools, snow fence.

19. There shall be processes implemented to ensure that:
    a) anchors are designed, installed and maintained for appropriate load capacities and certified by a professional engineer.
    b) inspection and maintenance of fall protection equipment occurs on a regularly scheduled basis.
    c) removal from and return to service if fall arrest equipment has been subjected to any loads.
    d) a written JSA is completed when working more than 7.5 m above ground.
    e) appropriate permission is granted from the relevant authority in high risk situations.
    f) cranes and hoists used to suspend work platforms operate at appropriate load capacities and in a safe manner.

5.4.2 PROJECT AND EQUIPMENT REQUIREMENTS

1. All working at heights equipment shall comply and be used in accordance with the intent and requirements of the relevant approved CSA design standards and manufacturers specifications.

2. Where there is potential to fall more than 1.8 metres, personnel shall use appropriate personal fall protection equipment. The use of body belts for fall arrest is prohibited, except for specialized tasks such as pole-climbing belts worn by specially trained linesmen.

3. Where there is potential to fall into dangerous or unprotected areas, access shall be restricted and assessed with appropriate controls put into place.

4. Single person anchor points shall be capable of withstanding 18kN (approximately 4000 lbf). Where it is not practical to install dedicated anchor points (e.g. ad hoc work), anchor points capable of withstanding the required loads shall be identified through a risk assessment process and shall be approved by a competent person prior to commencement of work. Lifelines shall be tagged to indicate that they have been designed and approved by a competent person. Stamped engineered drawings and inspection schedule are required for all horizontal lifelines prior to use.

5. Where personnel are required to work within 1.8 metres (6 feet) of an opening or leading edge where they could fall to another level, they shall use personal fall restraint equipment, such as a fixed lanyard and harness as a minimum, which will prevent them from falling over the edge.

6. Where operators need to gain access to places at height on large mobile machinery regularly (e.g. to clean windscreens or filters), then access ways should be provided. These access ways shall have handrails. Where handrails cannot be installed, then fall restraint, fall arrest equipment, or other solution shall be implemented dependant on the outcome of a risk assessment of each situation.

7. If work is to be done on a surface not designed for normal/regular access, an assessment should be completed to ensure that the surface can support the employees and work equipment, considering such factors as stability and load rating (e.g. ductwork, roof).

5.4.2.1 ELEVATING WORK PLATFORMS (EWP)

8. Personnel operating elevated work platforms and cages shall be trained and certified for the specific equipment they are using.

9. All forms of portable and movable elevated work platforms and suspended work cages shall conform to the intent and requirements of the relevant approved CSA design standards. People in the work platform basket shall wear a correctly fitted harness attached by a lanyard to a suitable anchor point in the basket.

10. The following controls are required for the use of EWPs:
    a) EWP to have appropriate warning devices.
    b) all warning labels and stickers must be clearly visible.
    c) there must be a documented inspection prior to use. The EWP should not be used if any deficiencies are identified that adversely affect the safe operation of the equipment.
    d) a signaller must be utilized while travelling in congested areas.
    e) an exclusion zone must be set up around the machine while in use.
    f) a harness and lanyard attached to the manufacturer's installed anchor point at all times, when inside the basket.
    g) no working alone. A ground person must be in within proximity, enabling visible and audible contact with the employee in EWP. The ground person must be trained to lower the EWP in the event of an emergency situation.

h) the EWP has been selected for the job so that workers are not required to stand on the mid or top rails of the platform.

5.4.2.2 LADDERS

1. Ladders and associated components must meet the intent and requirements of the applicable CSA standard.

2. The following controls are required for the use of ladders:
   a) ladders must be inspected each time before use and apply appropriate corrective/preventive action, as required.
   b) inspections and tagging of portable ladders must be conducted quarterly, at a minimum.
   c) the stability of any portable ladder must be ensured prior to use. All ladders shall be placed on firm and level surfaces.
   d) all extension ladders shall extend a minimum of 1 metre above the landing/step-off area.
   e) only short-duration and limited-complexity tasks are allowed to be performed off ladders. Ladders are not work platforms and should not be used as such.
   f) step-ladders must be fully opened and hinges locked into place, prior to use.
   g) extension-ladders should be tied at the top and bottom and maintained at a 1-to-4 ratio, when in use.
   h) the centre of gravity (belt buckle) of the person using the ladder must remain between the side-rails at all times.
   i) no side-loading or exerting or sideways forces while utilizing a portable ladder (e.g. cable pulling, drilling).
   j) if work is performed while standing on a ladder and the possible fall distance is more than 1.8 meters and 3-point contact cannot be maintained, a fall-arrest system should be used. The employee must not work alone.
   k) additional controls must be applied when using ladders near hand-rails or stairwells.

5.4.2.3 SCAFFOLDING

The following controls are required for the use of scaffolds:

1. All scaffolding shall be erected on firm and level surfaces.

2. Wherever practical, scaffold stairs should be used to provide access to the various areas. Exterior vertical ladders shall not be used on scaffolding over 15 metres in height.

3. Only qualified persons are to erect, dismantle, or modify scaffolds.

4. A 3-tag scaffold access/inspection system must be utilized (green, yellow, red).

5. To ensure a 3-point contact is maintained, and to reduce the possibility of falling objects, lifting/ nose bags must be used to transport materials between elevations whenever possible.

6. To minimize falling material and debris, scaffolds must be thoroughly cleaned prior to dismantling.

7. Stamped engineered drawings must be available at the worksite during installation, disassembly and use of a work platform, where required.

8. Safe working load limits for platforms shall be clearly marked at the work platform.

9. All scaffolds, which are more than twice the height of the base width, shall be secured to a fixed structure or employ outriggers to prevent tipping.

10. All scaffold sections shall be pinned together to prevent separation. Pinning shall comply with manufacturer's instructions.

11. Lumber used in scaffolding is of appropriate grade and marked.

12. Limits of approach are maintained when scaffolding is required near electrical lines, bus bars, or exposed electrical services.

13. Scaffolding is effectively grounded when there is a possibility of electrical contact.

14. Where there is a possibility of contact with vehicles or equipment, scaffolding must be sufficiently protected (e.g. jersey barriers).

15. A work platform must be removed from service if subjected to a sudden drop, electrically energized, or showing signs of structural or mechanical damage or wear, and not returned to service until certified as safe by a professional engineer.

5.4.3 PEOPLE REQUIREMENTS

1. All persons engaged in the erection, dismantling or inspection of scaffolds shall complete a competency-based exam, to confirm their knowledge and understanding of these activities. All persons who work on scaffolds shall receive training to ensure the recognition of scaffolding hazards that may affect them.

2. A competency based training program for employees and supervisors shall be in place, which includes provisions for maintaining competence. All persons engaged in work covered by this protocol shall be adequately trained and assessed for competency.

PROTOCOL 6 – LIFTING OPERATIONS

6.1 INTENT

To eliminate or minimize the risk of fatalities, injuries and incidents arising from the performance of lifting operations.

6.2 APPROACH

This protocol applies wherever lifting operations are undertaken. It includes lifts involving SNC-Lavalin owned, hired or contracted cranes such as mobile, crawler, tower, derrick, portal and pedestal-type, vehicle loading cranes, electric overhead traveling cranes, and monorail cranes. The protocol also applies to lifting accessories including slings, chains, wire ropes, shackles, padeyes, containers, baskets, tuggers, winches, man-riding winches, work and personnel transfer baskets.

In addition to the manufacturer's standard safety features, the intent and requirements of the applicable CSA standards and local statutory requirements, the following minimum safety features shall be included as indicated.

This protocol applies to all SNC-Lavalin controlled sites and activities, and to all SNC-Lavalin employees, contractors and visitors when involved in lifting operations. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented).

6.2.1 REASON FOR INCLUSION

A significant proportion of workplace fatal and high potential incidents have occurred in the course of lifting and crane operations. Identified causes and contributing factors include:

1. Lack of job planning and hazard assessment.
2. Incorrect selection of cranes and lifting equipment for the task.
3. Inadequate knowledge of lifting operations by personnel involved.
4. Inadequate inspection, maintenance, tagging and storage of lifting equipment and accessories.
5. Lack of training in correct use of lifting equipment and accessories.
6. Lack of competence in lifting operations.
7. Incorrect use of cranes and lifting equipment, including poor practices such as side loading, over loading and over reaching.
8. Poor recognition of unsafe conditions, including environmental conditions.
9. Operation of cranes and lifting equipment with safety and warning devices overridden, inoperable or illegible.
10. Incorrect design of cranes and lifting equipment.

6.3 DEFINITIONS

- **Crane** refers to a mechanical structure used for lifting weight
- Critical lift refers to any:
  a) tandem lifts by cranes/lifting equipment.
  b) lift over operating facilities/equipment.
  c) lift where the lifting equipment is within 80% of its rated capacity.
  d) lift involving special equipment or rigging (e.g. multi-level rigging, the use of more than 3 spreader bars, cargo nets etc.).
- **Lifting equipment** refers to tools, tuggers, and pieces of equipment used for lifting weight.
- **Lifting operation** means any operation using a crane and lifting equipment that involves the raising and lowering of a load, including the suspension of a load.
- **Lifting accessories** refers to any device which is used or designed to be used directly or indirectly to connect a load to a crane and which does not form part of a load, (e.g. wire rope slings, chain slings, synthetic fibre slings, hooks and fittings, swivels, shackles, eye bolts, rigging screws, wedge sockets, plate clamps and lifting beams).
- **Engineered Lift Study** refers to a document which sets out lift calculations, and which is stamped by a registered professional engineer.
- **External rated capacity lighting** refers to clearly visible green, amber and red lights mounted externally.

6.4 DEPLOYMENT

Please refer to the deployment section on page 3 for definition and explanation, and approval for alternative controls.

The requirements of this protocol are as follows.

6.4.1 PROJECT AND EQUIPMENT REQUIREMENTS

1. All electrical cranes shall have power supply isolation points capable of being positively locked.

2. Cranes shall be ergonomically acceptable to the site and have fall protection systems provided for their operation, maintenance and inspection.

3. Cranes without a physical locking system that disables and isolates its free-fall capability, shall not be used.

4. Electric overhead traveling and portal cranes shall have overload protection.

5. Crane cabins should be air-conditioned or heated in accordance with environmental conditions.

6. All crane hooks shall be fitted with a positive locking safety catch.

7. The safe working load (SWL) or working load limit (WLL) shall be clearly identified and marked on all cranes, lifting accessories and relevant lifting equipment and shall not be exceeded.

8. Load cells, load moment indicators and external rated capacity lighting shall be available in accordance with the table below.

Crane Type	Load Moment Indicator	Load Cell	External Rated Capacity Lighting
Mobile Rough Terrain	Shall	Shall	Shall
Mobile Rough Terrain	Shall	Shall	Shall
Mobile Truck Mounted	Shall	Shall	Shall
Crawler	Shall	Shall	Shall
Pedestal and Tower	Shall	Shall	Should
Electric Overhead Travelling	Not Applicable	Should	Should
Mobile Pick and Carry >10Tonne	Should	Should	Should
Vehicle Loading Crane	Should	Should	Should
Portal	Not Applicable	Should	Should

9. All cranes and lifting equipment, and lifting accessories shall comply with the intent and requirements of the relevant approved CSA design standard. In countries where the requirements of the relevant national standard exceed the requirements of the CSA standard, the national standard shall apply.

10. All cranes lifting equipment and accessories that are subject to periodic inspection shall be identifiable with a unique identity code or number.

11. A competent person shall determine the maximum environmental conditions under which cranes and lifting equipment can be safely used. Except in the event of an emergency, cranes and lifting equipment shall not be put into service if the maximum environmental conditions are exceeded. Risks shall be assessed and appropriately controlled in emergency situations.

12. Items of lifting equipment that are subject to wear and frequent replacement (e.g. slings, shackles, padeyes, shipping and handling baskets) or used to transport equipment to and from sites, shall be colour coded to confirm compliance with certification and inspection requirements.

6.4.2 PROCEDURAL REQUIREMENTS

1. The requirements of relevant OH&S legislation, regulations, standards and industry codes of practice must be followed.

2. A formal documented selection and acceptance process shall be in place for all new (to site) and modified lifting equipment, taking into account the crane's various safety features and cabin ergonomics, prior to commencement of work.

3. Manufacturer's crane and lifting equipment operating manuals and load charts shall be available to the crane and lifting equipment operators. These should be in the language of the country in which the lifting equipment is being used.

4. Where the crane and lifting equipment operator is not conversant with the language of the country, provisions shall be made to ensure that the operators can understand the operating manuals and load charts.

5. A procedure shall be in place to address:
   a) critical lifting operations.
   b) lifting operations when the arcs of operation of two or more cranes can overlap*.
   c) multiple crane lifting operations*.
   d) the danger to lifting operations when adverse weather conditions are present or imminent (e.g. electrical storm, high winds and sea state).
   e) people safety when cranes and lifting equipment are operating in the proximity of live electrical conductors*.
   f) lifting operations when lifting near or over unprotected, equipment or services.
   g) the effective hand-over from one operator to another for cranes with complex boom, jib or tower configurations.
   h) availability and use of check-lists for pre and post-operational inspections.

Detailed lifting plans are required for points above marked "*" and shall be approved by a competent supervisor. Pre-lift meetings shall be held prior to such lifts to ensure all personnel understand how it is to be executed.

6. Cranes shall not be used for lifting operations until crane operators have been given sufficient time to familiarize themselves with relevant aspects of the crane.

7. Risks associated with all lifting, crane maintenance, assembly activities and environmental conditions shall be assessed as part of the planning process. Barricading, warning signs or other means of ensuring personnel protection shall be in place during lifting operations and for those cranes left unattended in wind vane mode.

8. There shall be no side loading of crane booms.

9. With the exception of pick and carry operations, all lifting shall be carried out with outriggers deployed and locked.

10. Controls shall be in place to prevent objects from falling from above.

11. The lifting of personnel with cranes shall only be carried out using approved workbaskets or cages. Cranes used for this purpose shall be approved as suitable for man-riding operations. A recovery plan should be in place before personnel are lifted. Prior to lifting, any personnel in an approved basket with a crane, a load test shall be completed and observed with sign-off by designated health and safety personnel and a competent crane/lifting specialist.

12. The elimination of the need to work under suspended loads shall be pursued. Where working under suspended loads is unavoidable, controls shall be in place to eliminate or minimize the risks to personnel.

13. Any modification to cranes and lifting equipment shall be subject to the original equipment manufacturers approval and to a rigorous change management process.

14. A preventive maintenance system should be in place to ensure that all cranes and lifting equipment and accessories are maintained and in a serviceable condition.

15. All cranes and lifting equipment shall be inspected and tested (including non-destructive testing as required by the intent and requirements of the applicable CSA standard) prior to being operated or put into service. After any repair and/or modification, cranes and lifting equipment shall be inspected (and non-destructively tested as required by the relevant standard) prior to being returned to service.

16. Certificate of conformity to be readily available at all times in the crane unit.

17. A system of periodic inspection shall be in place for all cranes, lifting equipment and accessories. Lifting equipment shall be visually inspected and confirmed fit for purpose prior to being put into service. Visual inspection of equipment and accessories by approved competent person should be performed on a regular basis (e.g. six monthly) unless regulations in the local area require examination more frequently.

18. A register of all lifting equipment and applicable accessories should be maintained and readily available at all times in the lifting unit. This should include:

    a) the equipment's unique identification number.

    b) documentary evidence of all inspections.

    c) certifications.

    d) maintenance.

    e) modifications and tests.

19. There shall be processes implemented to ensure that:

    a) cranes and hoists are designed, constructed, erected, disassembled, inspected, maintained and operated in accordance with the manufacturer's specifications or professional engineer's specifications and the intent and requirements of the appropriate CSA standards.

b) daily inspections are carried out on cranes, hoisting and rigging equipment by appropriately competent people and these are documented.

c) the crane or hoist and interchangeable rigging equipment have appropriate identification details.

d) the rated capacity is not exceeded and rating capacity indicated on superstructure.

e) the load charts are located on equipment where required.

f) the crane and hoist equipment conforms to the relevant OH&S legislation.

g) the manufacturer's manual is always available.

h) the inspection and maintenance records are kept current and are available.

i) any modifications carried out on crane, hoist equipment and/or rigging are certified by a professional engineer.

j) safe means of ingress and egress.

k) appropriate calibrations of load weighing devices and moment indicators by manufacturer are conducted.

l) multiple crane lifts are conducted as appropriate.

m) workers are warned of lifts and suspended loads are not passed over workers wherever possible.

n) yellow or red barrier tape is used to barricade lift zone.

o) loads are never left suspended when unattended by operator.

p) nobody ever rides a load, slinging, hook or other rigging device.

q) emergency shut-off for electrically powered cranes is installed, tested and operational.

r) the crane operator receives direction of rigger/lift supervisor.

s) correct storage of hardware, slings and hooks is implemented to prevent inadvertent damage and exposure to the elements.

t) mobile cranes or boom trucks have appropriate load weight indicators and trim indicators.

u) appropriate safe modification and operation is considered for cranes on floating supports.

v) mobile crane/boom truck tire type, condition and inflation is in accordance with manufacture's specifications.

w) appropriate load-bearing surfaces are used for mobile cranes and boom trucks.

x) safe travel is considered with loads.

y) the rigger undertakes required physical and load rating inspections of hardware, Slings, wire rope slings, hooks, alloy chain slings, synthetic webbing Slings, metal mesh Slings and below the hook lifting devices prior to lifting loads and process for removal from service if required and a log of such to be maintained.

z) the rigging or rigging assembly loads are not exceeded.

aa) the safe detachment of loads is considered.

bb) the rigging design factors for rigging components are met.

cc) the appropriate use of hook safety latches and securing pins.

dd) the rigging and slinging devices as specified in of relevant OH&S legislation are installed.

ee) taglines are used wherever possible.

ff) slings are protected from sharp edges with softeners while in use.

gg) allowance is made for load rating reduction due to Slings operating at angles.

hh) an engineering lift study shall be completed prior to any critical lift.

6.4.3 PEOPLE REQUIREMENTS

1. Suitably qualified, certified and competent person(s) shall be involved in the planning, supervision and implementation of the lifting operations.

2. The roles and responsibilities for lifting operations shall be clearly defined.

3. A competency based training program for contractors, employees and supervisors shall be in place.

4. A competent inspector shall perform lifting equipment inspections. An approved examiner should assess the competency of the lifting and handling equipment inspector.

5. Appropriate crane, hoists and rigging awareness training for people likely to come into contact with loads being lifted, including what the risks are, what the controls are, emergency management and incident response procedures and where to get further information if required.

6. Crane operators and crew shall be able to communicate in a common language and to use the agreed to crane signals.

7. Sole crane operators shall also be trained in slinging practices.

8. A fit-for-work policy shall be in place, incorporating defined action levels for drugs and alcohol and a fatigue management plan.

9. Behaviour based observations shall be performed and any need for additional specific training shall incorporate the results of these observations.

PROTOCOL 7 – CONFINED SPACE

7.1 INTENT

To eliminate the risk of fatalities and minimize the potential for injuries or incidents arising from entering or working in confined spaces.

7.2 APPROACH

This protocol applies to all spaces/areas which meet the SNC-Lavalin or prevailing legislated definitions for a confined or restricted space. Furthermore, these protocols apply to any space/area which may become a confined or restricted space as a result of work activities, conditions and/or location. As soon as it becomes apparent that a space or area is becoming a confined or restricted space, this protocol shall be applied completely. See section 7.3 in this protocol for the SNC-Lavalin confined and restricted space definitions. Refer to local Occupational Health and Safety legislation for definitions from prevailing legislation.

This protocol applies to all SNC-Lavalin controlled projects, worksites, activities, employees, contractors, consultants and visitors. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented.).

7.2.1 REASON FOR INCLUSION

Confined or restricted spaces can lead to Immediately Dangerous to Life and Health (IDLH) situations. The most frequent reasons for confined or restricted space incidents include:

1. Failure to identify the confined or restricted space.
2. Lack of job planning and risk assessment.
3. Inadequate training or competence.
4. Failure to prevent unauthorized entry.
5. Failure to carry out appropriate and sufficient air monitoring.
6. Failure to wear appropriate respiratory protection.
7. Failure to properly wear and/or maintain breathing apparatus.
8. Failure to have/use/wear appropriate emergency rescue gear (lifeline, harness, emergency extraction equipment, etc.).
9. Failure to appoint a qualified watch person.
10. Failure to have a qualified rescue team prepared and capable to respond.

7.3 DEFINITIONS

The definitions provided herein should not be considered a full and complete description of the subject topics. Persons must check the prevailing legislation to confirm whether additional definitions exist and are applicable in the place of work.

- **Confined space** means an enclosed or partially enclosed space that:
  - ♦ Is not intended or designed for continuous human occupancy.
  - ♦ Has a limited or restricted means of access or egress.
  - ♦ Is large enough to be entered by a person to work.
  - ♦ At any time, contains, or is could contain, any of the following:
    a) an atmosphere that has potentially harmful levels of a contaminant.
    b) an atmosphere that does not have a safe oxygen level.
    c) contains a material that could cause engulfment.
  - ♦ Examples of a confined space:
    a) storage tanks, tank cars, process vessels, pressure vessels, boilers, silos and other tank-like compartments.
    b) caissons, coffer dams, pylons, pits and shafts.
    c) pipes, sewers, sewer pump stations including wet or dry wells, shafts and ducts.
    d) shipboard spaces entered through small hatchways or access points, cargo tanks, cellular double bottom tanks, duct keels, ballast or oil tanks and void spaces.
- **Inerted space** is one:
  - ♦ Where oxygen or fuel vapours are purged using an inert gas (e.g. nitrogen, carbon dioxide or argon) to remove the hazard of fire or explosion.
  - ♦ Where oxygen is displaced to ensure the concentration is too low to support combustion.
- **Restricted space** is one:
  - ♦ Which is fully or partially enclosed.
  - ♦ That is not both designed and constructed for continuous human occupancy, but in which atmospheric hazards are not present nor likely to occur.
  - ♦ Examples of a restricted space:
    a) electrical equipment rooms, utility tunnels, air plenums.
- **Purged space** is one where contaminants inside a confined space are displaced with air to achieve acceptable atmospheric levels.
- **Permits** are an administrative tool used to document the completion of a hazard assessment for each confined space entry. Minimum permit requirements include the:

- the length of time the permit is valid for.
- the name(s) of the worker(s) that will enter the confined space.
- the name(s) of the attendant(s) (safety watch) and/or supervisor.
- the location of the confined space.
- the work that is to be done in the confined space.
- the date and time of entry into the confined space and the anticipated time of exit.
- the details of any atmospheric testing done on the confined space - type of instrument used with serial number, when, where, results, date monitoring equipment was last calibrated. Ideally, calibration would be done just before each use. If this is not possible, follow the equipment manufacturer's guidelines for frequency of calibration.
- the use of mechanical ventilation and other protective equipment needed and any other precautions that will be followed by every worker who is going to enter the confined space.
- the process required for clear communication between the entrants and the watch person.
- the protective equipment and emergency equipment to be used by any person who takes part in a rescue or responds to other emergency situations in the confined space.
- a signature of the worker who did the confined space testing. The signature on the permit indicates that adequate precautions are being taken to control the anticipated hazards.

Please note, permit requirements are mandatory for confined space entry only, and may not be required for entry into a restricted space.

- **Ventilated** space is one:
  - Where there is continuous provision of fresh air into the confined space by mechanical means to maintain acceptable atmospheric levels.
  - where contaminants are removed continually for the entire duration that work is being performed in the confined space.

7.4 DEPLOYMENT

SNC-Lavalin Project Management carries the obligation to ensure the requirements established in this protocol are uniformly and consistently applied on SNC-Lavalin controlled projects. In cases where an area, equipment or condition is under the direction and control of a project contractor or subcontractor, SNC-Lavalin project management will require the contractor or subcontractor to uphold and maintain the requirements established herein.

The requirements of this protocol are as follows.

7.4.1 PROJECT AND EQUIPMENT REQUIREMENTS

7.4.1.1 CONFINED SPACE SIGNAGE

Confined spaces should be identified and fixed signage erected at the entry points denoting that a permit is required prior to entry. Where signage is impractical, other means of highlighting the dangers need to be used.

7.4.1.2 CONFINED SPACE PROCEDURE

All employees, contractors, consultants and visitors who will or may be required to enter a confined/restricted space shall be trained in the Confined Space Procedure. The procedure must:

1. Meet prevailing legislated requirements and be compliant with these protocols.

2. Detail what rescue equipment, systems, and personnel must be in place before entries are performed.

3. Ensure that effective communications systems are available for persons entering/working in the confined/restricted space.

4. These procedures shall be reviewed at least annually by a qualified person. The procedures shall include directions for:
   a) qualifications of the persons developing and/or approving confined/restricted space entry procedures/permits.
   b) qualifications of persons performing confined/restricted space risk assessments.
   c) clearly defined worker and supervisor responsibilities and duties.
   d) requirement to conduct confined/restricted space pre-entry meetings.

7.4.1.3 CONFINED SPACE PPE

1. All required personal protective equipment (PPE) including Respiratory Protection Equipment (If required) shall comply with NIOSH requirements, the intent and requirements of the applicable CSA design standard, manufacturer's specifications and prevailing legislated requirements.

2. Respiratory protection equipment selection and fit test procedures including functional tests and training, as applicable shall be carried out.

7.4.1.4 CONFINED SPACE AIR TESTING AND MONITORING

1. Air quality testing equipment shall be task appropriate and calibrated and maintained in accordance with manufacturer and legislative requirements.
2. The types and frequency of the air quality testing is identified, scheduled and conducted pre-entry and ongoing while persons are in the confined/restricted space. The air quality testing shall include, but is not necessarily limited to, confirming that:
   a) the percentage of oxygen content is within legislated safe ranges.
   b) lower explosive limits for flammable vapours is below legislated permissible exposure limits.

c) levels of other harmful naturally occurring or man-made compounds are maintained below legislated permissible exposure limits (H2S, CO, Methane, VOC's etc.).

Note: Air quality testing must be appropriate to the hazards, chemicals and conditions identified in the confined/restricted space risk assessment. See control 7.3.2.1 Risk Assessment for more details.

7.4.1.5 ISOLATION AND LOCK OUT (CRCP 04)

All energy sources within the confined/restricted space that could result in undue risk from an existing energized state, start-up or unexpected energy release shall be controlled in accordance with Protocol 4 – De-Energization, Isolation, Lock-Out and Tagging and prevailing legislation.

7.4.1.6 CONFINED SPACE DESIGN

A competent and qualified engineer shall inspect and certify:

1. All false works, supports or aids used to establish and/or maintain the confined space.
2. Any temporary mechanical ventilation systems which requires certification.

7.4.1.7 CONFINED SPACE EQUIPMENT REGISTER

All confined/restricted space equipment shall be fit-for-purpose and undergo pre-use checks and a minimum of six–monthly (bi-annual) documented inspections by a competent authorized person. An equipment register and tagging system shall be in place to indicate compliance with the inspection. Testing shall be done in accordance with recognized standards.

7.4.2 PROCEDURAL REQUIREMENTS

1. Confirm the applicable requirements of the prevailing OH&S legislation, regulations, codes and standards are understood and followed by persons assessing, controlling and entering a confined/restricted space.

2. SNC-Lavalin or the contractor responsible for the confined/restricted space must implement site specific confined/restricted space entry procedures. These procedures shall be reviewed at least annually by a qualified person. The procedures shall include directions for:

   a) qualifications of the persons developing and/or approving confined/restricted space entry procedures/permits.

   b) qualifications of persons performing confined/restricted space risk assessments.

   c) clearly defined worker and supervisor responsibilities and duties.

   d) respiratory protection equipment selection and fit test procedures including functional tests and training, as applicable.

   e) requirement to conduct confined/restricted space pre-entry meetings.

f) implementation of a confined space entry permit system including the requirement to physically inspect and monitor the space by the Entry Supervisor prior to permit approval and signature.

g) ensuring that any energy sources within, or brought into, the confined/restricted space are treated in accordance with Protocol 4 – De-Energization, Isolation, Lock-Out and Tagging and prevailing legislation.

h) ensuring the proper selection and use of PPE.

i) requirement to have immediately implementable rescue plans.

j) how communication will be maintained with attendants, and entrants.

k) ensuring clear access and egress are established and maintained.

l) ensure appropriate signage is in place to identify all confined spaces.

3. Procedures to evacuate the confined/restricted space if the air quality values reach or exceed the permissible exposure action levels. Re-entry procedures must also be documented, including the means of determining the source(s) of exposure, the measures to return air quality to acceptable limits and the means of preventing future occurrences.

4. Ensure effective cleaning, purging and venting processes are used as appropriate.

5. The process for confirming that a confined/restricted space has been properly inerted prior to entry, including notification to the relevant authorities as applicable.

7.4.2.1 Confined Space Risk Assessments

A documented risk assessment shall be conducted prior to entry into any confined/restricted space. Re-assessment will be required during the course of the work if and/or when:

1. The scope of work or conditions within the confined/restricted space changes.

2. The air quality readings unexpectedly change during the work and approach actionable levels.

3. There are/will be changes to the configuration or the confined/restricted space which alter the access and egress routes.

4. The documented risk assessments shall include:

   a) description of the confined/restricted space.

   b) description of the work activities to be performed within the confined/restricted space.

   c) identification of equipment, materials and processes to be brought into the confined or restricted space which may affect the air quality of the space.

   d) evaluation of all air quality hazards and their corresponding risk levels before the controls are implemented.

e) evaluation of all other hazards and their corresponding risk levels before the controls are implements, [e.g. noise, illumination, temperature, biological, vermin, engulfment etc].

f) evaluation and selection of appropriate control measures to reduce the hazards/risks to acceptable levels, using the SNC-Lavalin Hierarchy of Controls.

g) identification of the PPE and respiratory protection equipment to be used/worn within the confined/restricted space.

h) identification of the equipment to be used to ventilate the space, including as necessary the calculations - performed by a qualified person - to determine the appropriate air exchange rates and equipment capabilities.

i) identification of the type and quantity of gas detection equipment, and, identification of the calibration schedules and frequency of testing within the confined/restricted space.

j) identification of the emergency response procedures, equipment and personnel to affect rescue based on the risk levels and work activities.

k) evaluation of other factors which might alter the risk levels within the confined space, (e.g. wind, dust, gases, distances, etc.).

l) identification of any limitations on entrants due to the configuration of the space, (e.g. maximum allowable distance from the entry location based on rescue requirements.

7.4.2.2 Emergency Response

Emergency response plans and procedures shall be in place prior to commencement of confined or restricted space operations and shall include:

1. The types of emergencies which may arise based on the risk assessments.
2. The means of notification and communication of an emergency, including the personnel to be contacted in case of an emergency.
3. The means of initiating a rapid evacuation of all entrants within the confined/restricted space.
4. Written plans for the rapid retrieval of personnel in the event of an emergency. At minimum this will include specific information on the methods of rescue and equipment requirements (e.g. hauling equipment, overhead anchors, tripod system, reserve equipment, medical equipment, additional PPE, etc.).
5. The names and contact information for the Emergency Response Crews, First Aid Attendants and other first responders.

   a) the numbers and positioning of the emergency response personnel must be appropriate based on the hazards/risks inside the confined/restricted space. The risk assessment must be used to evaluate and identify these emergency response requirements.

   b) the training and competency requirements for the emergency response personnel.

   c) where the local emergency response agency personnel (Fire, Ambulance, Police) are expected to be part of the emergency rescue plans, these agencies must be contacted and confirm

their participation in the rescue efforts. local emergency response agencies must be brought to site and shown the locations of the confined spaces and any barriers to rescue.

6. An emergency management and incident response drill schedule must be implemented and tested at intervals which ensure emergency response personnel are capable and competent to affect rescue from the confined/restricted spaces.

7.4.3 PEOPLE REQUIREMENTS

1. All persons who will or may enter or work in confined/restricted spaces shall be appropriately trained. Training shall include at minimum:
   a) the roles and responsibilities of the Entry Supervisor, Entrants, Watch Person and the Emergency Rescue personnel.
   b) the requirement to be identified and granted permission to enter the space (no one shall enter a space without the knowledge and consent of the Entry Supervisor).
   c) The hazards, risks and controls measures for the confined/restricted space.
   d) the requirements for pre-entry testing and confirmation of air quality prior to entry.
   e) the means of ventilation for the space and the actions which must be taken in the event of a failure of the ventilation systems.
   f) the proper use of the air quality test equipment and the permissible exposure limits.
   g) the actions which must be taken in the event the permissible exposure action limits are reached or exceeded (e.g. shut down equipment, vacate the space, etc.).
   h) the scheduled check-in procedures with the watch person.
   i) what to do in case of an emergency, including first aid, emergency extraction and rescue procedures.
   j) the limitations on the work activities (e.g. no unplanned work may be performed if it has not been identified, assessed and approved by the Entry Supervisor).
   k) the general and specific PPE requirements, including respirator fit testing requirements and restrictions (e.g. must be clean shaven).
   l) general prohibitions and safeguards (no smoking, where first aid equipment is located, etc.).
   m) a competency based test to confirm the understanding of the entrants and watch persons.
   n) competency based tests shall be kept on file by SNC-Lavalin or the contractor who is responsible for the confined/restricted space for the duration of the project.
   o) recurrence competency testing must be performed for long duration projects and/or where conditions within the confined/restricted spaces changes to increased risk.

2. Process to verify that only appropriately competent people enter and conduct emergency rescue activities in a confined/restricted space.
   a) all project personnel who perform emergency response must receive specific training which

includes identification of the confined/restricted spaces and the specific response actions for affecting rescue.

b) a curriculum must be developed and delivered to all emergency response personnel.

c) emergency response training should include practice exercises as part of the training program.

3. Projects shall utilize a process to ensure that selected personnel are fit to work in confined spaces.

PROTOCOL 8 – EXCAVATIONS, TRENCHES AND CORING

8.1 INTENT

To eliminate the risk of fatalities and reduce the potential for injuries and incidents when working in and around excavations and trenches.

8.2 APPROACH

This protocol applies when creating and/or working in and around excavations and trenches. See section 8.3 in this protocol for the SNC-Lavalin excavation and trench definitions. Refer to local Occupational Health and Safety legislation for definitions from prevailing legislation.

This protocol applies to all SNC-Lavalin controlled projects, worksites, activities, employees, contractors, consultants and visitors. (Note: if client or local legislation requires more stringent controls, then those controls shall be implemented.).

8.2.1 REASON FOR INCLUSION

Excavations and trenches can lead to Immediately Dangerous to Life or Health situations and must be effectively controlled to prevent incidents. The most frequent reasons for incidents involving excavations and trenches include:

1. Inadequate job planning or job assessment.
2. Inadequate training or competency.
3. Failure to identify the location(s) of buried utilities.
4. Failure to properly cut back or shore walls, resulting in collapse and entrapment.
5. Equipment operating too close to the edge of an excavation or trench.
6. Spoils piles left too close to the edge, resulting in collapse and entrapment.
7. Falls into the excavation from unprotected edges.
8. Inadequate means of egress.

8.3 DEFINITIONS

- **Cut back** means the process of, battering, sloping or benching an excavation to prevent wall collapse, slippage or shelling.
- **Coring** means any activity involving vertical or horizontal penetrations into the ground of surface including, but not limited to, auguring, bore holes, installation of stone columns and/or piles, or creating opening in floors or walls.

- **Excavation** means any man-made cut, cavity, trench, or depression in the earth's surface formed by earth removal.
- **Shoring** means a pre-fabricated or hand built structure installed into the excavation to prevent collapse of the excavation walls.
- **Shotcrete** means the process of installing anchors, ties and mats onto a vertical face of an excavation and then applying concrete to create a solid face.
- **Spoil** means the materials removed from the excavation or trench.
- **Trench** means a narrow underground excavation that is deeper than it is wide, and is no wider than 15 feet (4.5 meters). **See Appendix A for trench diagrams.**

8.4 DEPLOYMENT

SNC-Lavalin project management carries the obligation to ensure the requirements established in this protocol are uniformly and consistently applied on SNC-Lavalin controlled projects. In cases where an excavation or trench is under the direction and control of a project contractor or subcontractor, SNC-Lavalin project management will require the contractor or subcontractor to uphold and maintain the requirements established herein.

The requirements of this protocol are as follows.

8.4.1 PROJECT AND EQUIPMENT REQUIREMENTS

1. Ensure that all employees, contractors, consultants and visitors who will or may be required to create, enter or work in an excavation or trench are informed of these protocols.

2. All excavations greater than 6 meters in depth shall be assessed and approved by a Professional Engineer.

3. All excavations exceeding 1.2 meters in depth must be cut back or shored in accordance with prevailing legislation unless otherwise approved in writing by a Professional Engineer.

4. Trenches more than 1 meter deep and over 6.0 meters in length shall have a means of egress located every 6.0 meters along the trench unless otherwise approved in writing by a Professional Engineer.

5. All spoils materials shall be kept a minimum of 1.0 meters back from the edge of a cut back excavation, or, the distance equalling the depth of the vertical face of the excavation when cut back is not used, unless otherwise approved by a Professional Engineer.

6. All mobile equipment operations shall be performed in accordance with Protocol 1 – Vehicles and Mobile Equipment.

7. All buried utilities within the excavation or trench area shall be identified and protected from damage, or, shall be de-energized or controlled to prevent energy release. Control of energy release shall be performed in accordance with Protocol 4 – De-Energization, Isolation, Lock-Out and Tagging.

8. All excavations with a vertical face greater than 1.8 meters high shall be perimeter protected to prevent falls into the excavation. Perimeter guardrail protection shall comply with Protocol 5 – Working at Heights.

9. All lifting operations (e.g. placement of shoring cage in excavation, lowering of rebar, pipes etc into the excavation/trench) shall be performed in accordance with Protocol 6 – Lifting Operations.

10. Barricades and/or plates shall be used to protect or cover any excavation or trench which crosses a site or public roadway or sidewalk and shall be designed/approved such that they are appropriate for the use (e.g. load consideration for vehicle and/or pedestrian traffic, etc.).

8.4.1.1 SOIL CLASSIFICATION, CUT BACK AND SHORING

1. Ensure assessment of the soil conditions and classification of soil type as applicable.

2. Ensure soil stabilization through cut backs, shoring or a combination of both. See the charts below for cut back guidelines.

3. Ensure shoring systems are appropriate to soil conditions and work activities and are inspected and certified by a Professional Engineer as applicable.

4. Ensure a design and construction plan is developed and followed for all excavations which use shotcrete walls as the principle method of shoring. The excavation design and construction plan must be approved by a Professional Engineer.

Type of Soil	Compressive Strength (kPa)	Cut back diagram
A: hard and compact the walls are sloped to within 1.5 meters of the bottom of the excavation at an angle of not less than 30 degrees from the vertical	144 <	B: Likely to crack or crumble the walls are sloped to within 1.5 meters of the bottom of the excavation at an angle of not less than 45 degrees from the vertical	48 – 144	C: Soft, sandy or loose the walls are sloped from the bottom of the excavation at an angle of not less than 45 degrees from the vertical	< 48	Any	n/a	
Excavation Depth (m)	Soil type	Angle (º)	Cutback Distance (m)
3	A – Hard	30	1.5m @ 30 º = 2.6
	B – Cracks	45	1.5m @ 45 º = 1.5
	C – Sandy	45	3.0m @ 45 º = 3.0
5	A – Hard	30	3.5m @ 30 º = 6.0
	B – Cracks	45	3.5m @ 45 º = 3.5
	C – Sandy	45	5.0m @ 45 º = 5.0

8.4.2 PROCEDURAL REQUIREMENTS

1. All contractor excavation programs shall meet the prevailing legislated requirements and be compliant with these protocols.

2. A documented risk assessment shall be conducted before the commencement of excavation work and at any time the scope of work changes. The risk assessment shall include:
   a) identification of buried utilities and planned methodology for exposure.
   b) identification of overhead utilities and protective measures.
   c) equipment requirements and means of access/egress.
   d) cut back and/or shoring system details.
   e) spoils removal and stockpile methods, including placement locations.
   f) personnel access and egress routes and associated ladders, stairs.
   g) influence of weather on the condition of the excavation (e.g. deteriorating face or cut back, accumulation of water, etc.).
   h) evaluation of potential air qeuality and hazardous materials issues within the excavation (e.g. accumulation of equipment fumes. petrochemical/groundwater contamination, biological hazards, etc.).

3. Develop and implement written excavation procedures which shall be reviewed annually. The procedures shall include directions for:
   a) ensure that excavations and trenches are inspected daily or as conditions change.
   b) ensure that personnel are made aware of the excavation through flagging, marking, safeguards or other appropriate and effective means.
   c) ensure that excavations and trenches that personnel may be required, or permitted to enter, are kept free of an accumulation of water that may pose a hazard to the occupants.

d) ensure that spotter personnel are used whenever mechanical excavation work comes within 1 meter of a buried utility. Manual excavating or hydro-vac shall be performed within 1 meter of the buried utility until it is adequately exposed.

e) ensure that personnel properly enter and exit shoring cages.

f) ensure that personnel do not work in insufficiently sloped or unprotected excavations greater than 1.2 meters deep,

g) emergency response and incident management.

4. An excavation permitting system shall be used for all excavations containing buried utilities, voids, manholes etc. The excavation permit shall be approved by a qualified person prior to work commencing.

5. Ensure that locate and as-built drawings are readily available for review by equipment operators and spotter personnel.

8.4.3 PEOPLE REQUIREMENTS

6. Ensure proper training and instruction is provided to all personnel involved in excavating and working in an excavation, including:

   a) what the risks are.

   b) what the controls/safeguards are.

   c) emergency response and incident management and where to get additional information,

7. All personnel involved in excavating and exposing buried utilities must review and sign the Excavation permit before commencing work.

8. Process to ensure that only appropriately competent persons act as spotters to guide equipment operator near buried utilities.

APPENDIX A

Exavation

A man-made cut, cavity, or depression in the earth's surface.

Open-face excavation

Trench

- Deeper than wide
- No more than 15 feet wide at the bottom

Open-face Trench

Forms or other structures installed in an excavation that reduce its width to less than 15 feet, measured at the bottom.

1.0 PURPOSE

1.1 Introduction

These instructions cover the general requirements for standard Packaging & Marking for all types of Goods (equipment & materials) for international shipments. It is designed to serve as a guide to a minimum acceptable level of Packaging. The Supplier published specifications will supersede these instructions as long as the minimum SNC-Lavalin Inc. requirements are met and they have been approved by SNC-Lavalin Inc. for each project.

The following instructions are intended as minimum requirements, and adherence to these instructions in no way absolves or relieves the Supplier of any responsibility or obligation outlined elsewhere in the Purchase Order.

Methods used shall be such as to warrant safe preservation to protect materials against environmental induced corrosion, damage and or degradation during the storage, handling and delivery of the commodity to its ultimate destination at the lowest reasonable cost.

Responsibilities will be defined for the Supplier and the Contractor, throughout this Documentation, Packaging, Marking and Shipping Instruction (GDPMSI), providing the minimum requirements for material preparation, preservation and seaworthy packing.

This GDPMSI will become an integral part of the conditions of all Purchase Orders generated by the Contractor.

The acceptance of the Purchase Order implies that the Supplier agrees to accept all conditions and will follow all instructions, set forth therein, and that the Supplier will reimburse the Contractor for any demurrage, penalties and fines, due to the Supplier's negligence to comply with these instructions. Aforementioned includes losses or damages due to use of inadequate protective materials, faulty or insufficient packing, improper marking and/or incorrect documentation.

1.2 Definitions

Contractor	SNC-Lavalin Inc. (SLI) for the execution of the Project.
Package	Any outside enclosure such as a case, crate, barrel, drum, bundle or other such facility used to enclose or protect the items in transit.
Delivery Terms	International standard delivery terms (INCOTERMS 2010) define the transfer of title of Goods and the responsibilities of each party in the agreement. The Purchase Order details the Delivery Terms, under which the Supplier is obligated to deliver the Goods.
Purchase Order	The contractual document issued by Contractor for the Purchase of Goods and which defines together with its attachments the duties and obligations of the parties.
Supplier	A Company or individual selected from the Project Suppliers List to supply Goods for the project to whom a Purchase Order is placed
Forwarder	Supplier of Transportation services acting for and on behalf of Contractor. Forwarder may also provide Customs Clearance services.
Goods	All material and equipment, consumable or non-consumable, hazardous or non-hazardous, described within or not, or as part of the sub-items of the purchase order.
Packaging	The preparation, preservation, unitization, and protection of the equipment/materials purchased, in order to prevent loss or damage through the transport chain (by road, rail, air, and ocean) and storage during minimum 12 months after delivery at Job-Site.
Packing List	The shipping document detailing the description of Goods, shipping configuration of items, number of items contained within any Package, dimensions & weights for each Package and any other specific requirement (i.e. P.O. line item weight, etc.) if required.
Hazardous Cargo	Dangerous cargo marked by Supplier such as explosives, flammable, corrosives, poisons, precisely and strictly in accordance with rules and regulations of the country of origin, as well as the International Maritime Dangerous Goods Code (IMDG) for ocean freight, or International Air Transport Association Regulations (IATA) for air freight.
Job-Site	The area where the Goods are to be delivered and if not the job-site then to a destination to be determined by the Contractor.

2.0 CONFLICTING REQUIREMENTS

In case of conflicting requirements, the following items govern in descending order of precedence.

a) Agreements outlined in mutually approved minutes of meetings subsequent to the issuance of the purchase order.

b) Purchase Order and relevant revisions or supplements.

c) Specifications detailed herein.

3.0 GUIDELINES FOR PACKAGING

Packaging means to efficiently and effectively protect Goods, from the moment they leave the factory until they are installed on Job-Site.

Packaging shall be sufficient to withstand without limitation, rough handling during loading/unloading, sea, air and inland transport, and exposure to extreme temperature, salt, and precipitation during transit, and outdoor storage. Packaging includes pre-packaging treatment and protection activities such as application of anti-corrosion, coating, vacuum, pealing, desiccants, solvents, etc. Depending on their type, Goods are to be protected against both mechanical damage (shocks, rupture, breakage, loss) and corrosion (rain, salty atmosphere, sand, etc.).

In every instance the desiccant/moisture absorbent supplied within the Packaging must be suitable for outdoor storage during extreme temperature variances (+40 to –40 C) at the Contractor jobsite for a minimum of 6 (six) months. The Supplier will ensure that locations and expiry date of the desiccant is clearly identified on each package to ensure change out of desiccant occurs.

3.1 Minimum Preparation Requirements by the Supplier

Regardless of General Purchase Conditions, the Supplier has ultimate responsibility to assure that Goods shall be adequately prepared to provide against entry of dust, sand, water, damage, theft, rust, etc. with inner Packaging and wrapping, prior to export boxing. This constitutes preparation and Packaging of the Goods which includes all pre-crating protection activities, such as application of anti-corrosion coatings, vacuum packing, desiccants, solvents, end caps, etc. (Specific lubricants types, inhibitors and other internal detail preservation requirements are the responsibility of the Supplier.

The sealing barrier, if any, shall be such that the Goods can be identified (e.g., by customs authorities) without breaking the sealing (This will not apply to foil bag).

3.2 General Packaging Instructions

In article below (3.3) is reported a brief summary on different allowable types of packing and materials to be used.

The metric system for weights and dimensional measurements shall be used where ever possible and depending on normal customs and practices of the shipping location.

Please note that “special” handling for certain types of equipment may be included in the Purchase Order. These specific packaging instructions will take precedence over requirements stated below. It remains the Supplier’s responsibility to supply this minimum or better and more suitable protection and/or packaging than as specified below, to ensure safe arrival of the Goods at their ultimate destination. Any variances from this must be mutually agreed upon by both the Supplier and Contractor.

The Supplier will be responsible to identify products that will be harmed by the extreme weather and temperature changes, as well as those products require inside temperature controlled storage.

Goods of more than one Purchase Order shall not be packed together in one package.

Outside packaging MUST take into consideration risk of exposure to a variety of extreme climatic conditions for inland transport and short & long term storage at the Job-Site. This protection must be effective for a 12-month period after delivery on Job-Site.

Spare Parts shall be packed separately.

3.3 Types of Packaging

In accordance with the nature of the contents, the following types of Packaging shall be considered.

Inner or outer Packaging will not be returned, unless otherwise specified in the order.

The structural characteristic will be explained below, and details of each type of Packaging will then be listed.

Under no circumstances shall Fibreboard, Cardboard, or similar cartons to be used as outside Packaging.

3.3.1 Wooden Case

The cases must always allow for handling by fork lift truck; they must therefore be provided with battens which allow the forks to pass at right angles beneath the longest side.

Base boards must be simply fined. The base must not be covered with tarred paper or polythene to allow for ventilation and water drain from the case.

In some instances, tarred paper may be allowed to avoid moisture from getting in through the bottom of the case.

The base structure (flats and boards) must be such as to equally distribute the weight of the apparatus.

The cases and crates are subdivided into three categories:

- weight of contents up to 500 kg
- weight of contents up to 2,000 kg
- weight of contents up to 20,000 kg (*)

- (*) In the case of exceptional and particularly cumbersome equipment (e.g. apparatus weighing over 20,000 kg), Supplier will consult Contractor to agree the most appropriate type of Packaging.

- <u>Cases up to 500 kg (reference: attachment A)</u>

  Carrying built crossed bars: Where the contents permit cases may be without base slat, these will be replaced by carrying crossbars to permit movement with a fork lift truck and will also serve as a batten for lifting ropes. Minimum dimensions of the base bars: 6 x 10 cm. The carrying crossbars on the boarding and on the cover must have minimum dimensions of 10 x 2.5 cm.

  Planking: Planking must be 2 to 2.3 cm thick.

  Base: Base planks must be 3 cm thick.

  Bands: Each case must be bound with at least two bands.

  Cover: The cover must be lined internally with polytethylene sheet (top) and a sheet of tarred paper (bottom).

- <u>Cases up to 2,000 kg (reference: attachment B)</u>

  Base Blocks: Cases must be provided with battens on the bottom parallel to the longitudinal access.

  The dimensions of the battens must be 12 x 12 cm, spacing approx. 60 cm.

  The section and the space between must be proportionate to the structural characteristics, dimensions and weight of the product.

  The ends of the slats must be bevelled at 45° to allow for the positioning of ropes.

Slats: Slats 8 cm thick should be placed crossways beneath the beams, raising the Package for lifting ropes or to allow movement with a fork lift truck.

The position and number of the slats will be determined in accordance with the length of the case and the relative centre of gravity.

The slats must be about twice as wide as they are thick and may be fixed by screw (preferred), nails or staples.

Base: The base boarding must be 4 cm thick and be nailed or bolted or screwed to the base crossbars.

Planks: Planks must be laid vertically so as to achieve improved resistance to superimposed weights.

Stiffening struts: Stiffening struts must be placed immediately beneath the cover (10 x 4 cm minimum and 80 cm minimum spacing).

Since their objective is to protect the case against the pressure imposed by the lifting ropes, the dimension of the struts must be proportionate to the weight of the Package and to its size.

Cover: Horizontal bracing may be external or internal. The dimensions and spacing will be proportionate to the dimensions and weight of the case.

The cover must be lined internally with polyethylene sheet (top) and a sheet of tarred paper (bottom).

- <u>Cases up to 20.000 kg (reference: attachment C)</u>

They are similar to the previous category. Obviously they must be sturdier.

Planking: Planking must be 3 cm thick.

Bottom boards: Closed tight and of the following dimensions:

12 x 12 cm for weights up to 6,000 kg
15 x 15 cm for weights up to 9,000 kg
20 x 20 cm for weights up to 20,000 kg

Base: The base boarding must be at least 5 cm thick and be bolted or screwed to the base beams.

Cover: Horizontal bracing may be external or internal. Section 20 x 4 cm (80 cm max spacing) the cover of these cases must be supported by a lattice frame (section approx. 15 x 3 cm). The squares or rectangles in the lattice may not exceed 40/50 cm at the side, to obtain a sufficiently resistant cover.

The cover must be lined internally with polyethylene sheet (top) and a sheet of tarred paper (bottom).

3.3.2 Wooden Crates

General

All wood and/or lumber used in Packaging, pallets or for securing within containers must be heat treated and/or fumigated so that they meet with the requirements of the country of export and/or destination . The treated Packaging materials must be marked with a universally recognized symbol or another approved by the Canadian Food Inspection Agency (CFIA) or other internationally recognized organization, prior to any shipments being released by the Vendor, to demonstrate they meet with the requirements of the recipient country. Recycled, remanufactured or repaired wood Packaging material should be re-certified and re-marked.

Plywood made from veneer which has been rotary cut, sliced or sawed, must be well seasoned, commercially dry and free from defects that would materially lessen the strength. Plywood must be at least 3 ply for boxes when cleated and at least 5 ply for boxes when nailed. Nailed boxes must be assembled with grain of outer plywood face in the direction of the longest faces of the box and securely nailed or fastened to corner posts or ends. Boxes exceeding 17 kg (35 pounds) must have 4 vertical corner posts or other equally suitable devices or fasteners.

All components of such material should be treated. Any and all costs associated as a result of non-compliance to phytosanitary regulations including the ISPM 15 regulation shall be to the seller's account.

Export and International

Supplier shall abide by and be fully compliant with the International Standards for Phytosanitary Measures (ISPM #15) as described in The Guidelines for Regulating Packaging Material in International Trade set out by the Secretariat of the International Plant Protection Convention administered by the Food and Agriculture Organization (FAO) of the United Nations.

As an exporter, the Canadian law requires that importing countries phytosanitary import requirements be met as provided in policy D-01-5 of CFIA.

Import into Canada

Supplier shall abide by and be fully compliant with The Entry Requirements for Wood Packaging Materials Produced in All Areas Other Than the United States and China (D-98-08) as set out by the CFIA. In the case where wood Packaging materials are produced in China the CFIA directive (D-98-10) is applicable. Canada has adopted the Regulatory Guidelines Established in International Standard for Phytosanitary Measures as set out by the FAO.

These regulations apply to all non-remanufactured and non-treated wood utilized for crates, pallets, skids, case, bracing, spacers, bearers, dunnage etc. except between Canada and the United States of America. Participating countries at the time include Canada, United States, Mexico, European Union, Korea, China Australia and New Zealand. Other countries must be verified by project.

The wood Packaging must be heat heated or fumigated using methyl bromide at rates specified in policy D-98-08 (CFIA).

The treatment or a process of treatment must be officially endorsed by the National Plant Protection Organization (NPPO) of the exporting seller.

The treated Packaging must be marked with a universally recognized symbol or another approved by the CFIA prior to any shipments being shipped by the seller.

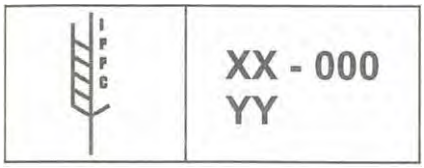
Recycled, remanufactured or repaired wood Packaging material should be re-certified and re-marked. All components of such material should be treated.

Marking

Seller must ensure that the internationally approved mark to certify that the wood Packaging material that bears the mark has been subjected to an approved measure and is clearly visible on the crate, dunnage, case, pallet, etc… for approval of entry. A sample of the logo is available from CFIA and the FAO.

The mark shown below is to certify that the wood Packaging material that bears the mark has been subjected to an approved measure.

The mark should at minimum include the:



- Symbol
- ISO two letter country code followed by a unique number assigned by the NPPO to the producer of the wood Packaging material, who is responsible for ensuring appropriate wood is used and properly marked
- IPPC abbreviation for approved measure used:
  - HT-Heat Treated
  - MB- Methyl Bromide
  - KD-Kiln Dried
  - CPI-Chemical Pressure Impregnation

- Marking should be:

  - according to model shown above
  - legible
  - permanent and not transferable
  - placed in a visible location, at least two opposite sides of the article being certified.

Non-Compliance

Any costs associated with the inspection or with bringing a shipment into compliance is the responsibility of the Supplier. Failure to meet foreign import requirements may result in the refusal of entry of the shipment, destruction of the wood Packaging, suspension of trade and domestic penalties or fines. Any such costs will be to the seller's account.

Reference Material

Details of these regulations are available on the internet:

a) Canada: www.inspection.gc.ca

b) International: www.fao.org

c) Other site: www.dcmnr.ie

3.3.3 Metal and PVC Barrels

Barrels with a capacity of less than 100 litres will be packaged in crates or arranged on pallets protected with a heat-shrunk cover and cross hoops.

Barrels with a capacity of/or greater than 100 litres will be sent individually.

Metal Strapping shall be of unannealed steel and applied with stretching tool and secured with crimped steel seals. Sizes of strapping utilized should follow latest practices developed by manufacturers depending on weight of package being strapped.

Nails should be cement coated or spiral type and should comply with latest issue of CSA Standards.

3.3.4 Wooden Drums (Wooden Reels)

Drums should be made of robust construction to afford effective protection during transport and handling. Wooden reels must be complete, in good condition and have been recently painted with waterproof paint.

Drums must be closed by staves nailed to the flanges with strengthening boards, 8 x 8 cm, placed laterally below the staves at distance of 50 cm.

For drums over 1.5 m in diameter, these reinforcing boards must be replaced by stays bolted to the flanges.

A sheet of tarred paper and a polystyrene sheet must be placed beneath the staves.

Drums must have at least 2 complete turns of strapping.

3.3.5 Equipment on Saddles and Skids

Openings in equipment shall be closed by metal sheets or wooden covers and painted a different colour. Sheets and covers shall be firmly attached to equipment or material, i.e. NO tape but preferably bolting.

All skid and saddle locations shall be indicated by the Supplier on the transport and lifting drawing (reference point 9) and approved by Contractor engineering department. Surface areas which may come into contact with slings during lifting are to be covered with wooden hurdles.

The equipment shall be fitted with suitable lifting lugs, or be properly marked as where to place the slings. The Centre of Gravity (CG) shall be indicated by the Supplier**.**

(For cargoes originating from the European Union, all lifting devices supplied, shall be officially Certified by a recognized authority. Subject certificate shall be sent to Contractor Inspection Department before the effective transport date).

3.3.6 Twenty (20) and Forty (40) feet not-Returnable Shippers Owned Containers

The use of ocean freight containers as Packaging (for sea transportation) shall be formally forbidden, except by Contractor's written authorization.

40' metal containers may be used for the consolidation and packaging of equipment. The contents of the containers must be properly blocked and braced in order to prevent any movement inside the container. Weight will be properly distributed in container.

Containers are to be new, or if previously used then they are to be free from dents and perforations and require a marine survey certificate certifying they are wind and water tight and conform to CSC standards. 20' containers are not generally recommended and will only be accepted if the Supplier requests in writing and receives Contractor's authorization to use twenty-foot containers.

The Contractor reserves the right to request also RINA approval.

3.3.7 Bundle and Loose GOODS

Only pipes, steel structures and plates can be packed in bundles or loose.

Each length of pipe of 150 mm or larger diameter shall be treated as an individual package and marked accordingly. Pipe smaller than 150 mm shall be bundled by strapping cleats or cradles of 50 x 100 mm lumber above and below the load. Ends of pipe must be capped if not in crates.

The Packaging detail will be shown in the point 3.4.

3.4 Supply Categories

Main supply categories listed below shall be packed in accordance with the types of Packaging shown in point 3.3.

3.4.1 Machinery (pumps, compressors, turbines, engines, ventilators including blowers, reduction gears, bridge cranes)

The type of Packaging used for machinery will be a wooden case.

In order to protect the machinery, heat-insulated bag must be used and, to maintain the humidity at 35%, dehydrating agents must be placed inside the bag.

All auxiliary threaded connections must always be hermetically sealed by means of threaded metal plug, and greased.

Machine finished surfaces shall be coated for protection against water and humidity for ocean shipment. All unfinished surfaces of machinery are to be given one coat of rust protecting paint.

All unprotected metal surfaces subject to corrosion or deterioration, shall be coated with a soft drying petroleum base preservation compound. Care shall be exercised in applying preservation coatings so as to ensure that items fabricated of leather, mica, rubber and similar materials are not coated with the preservative compound.

All critical working surfaces such as close tolerance shafts, bearings, seals, and spindles, shall be protected from the entrance of dirt and moisture by wrapping with a greaseproof waterproof paper having a neutral pH factor. This wrapping shall be secured firmly in place with pressure sensitive tape or wax coated twine. All openings of electric motors, generators and other electrical equipment shall be sealed with pressure sensitive tape. Brushes and armatures of motors and generators shall be also wrapped with a piece of Grade A greaseproof paper.

VPI, VCI, and Vapour Barrier papers to be utilized where critical moving parts of machinery, are subject to rusting due to condensation. These uses are limited by the various metal content of certain products.

Equipment such as electronics and other instrumentation shall be packed in an interior moisture-vapour-proof barrier with silica gel, or a comparable desiccant, to absorb moisture within the package and marked fragile. Where required equipment will be vacuum packed to ensure materiel is not damaged by elements during transport or storage period in tropical climates.

Openings in electric motors, generators and other electrical equipment shall be sealed with waterproof tape or in some equally efficient manner. A protective paper (Grade A - Greaseproof or equivalent) shall be inserted between the brushes and armature of motors and generators.

Fragile items shall be wrapped in crepe cellulose wadding or some equally efficient cushioning material and/or floated in excelsior. Fragile articles must be packed in substantial wooden cases with special precautions against risk of breakage.

3.4.2 Cables and any Kind of Material Wound on Drum

Drums: Cables and any kind of material wound on drum (flexible tubing i.e. hose, multiple tubing, copper cables and tubes) will normally be supplied on wooden drums (wooden reels).

Sizes must be those specified in the Data Sheet, and the tolerances allowed under the relevant standards must be observed.

Cases: Power and instrument cables and copper tubing wound in skein (small dimensions) should be packed in cases.

3.4.3 Pipes and Tubes

Steel pipes: Pipes of carbon steel, of low-alloy steel, galvanized, in diameter up to ½" (15 mm) and less than 2 mm in thickness will be packed in crates, the gross weight of each crate not to exceed 1,500 kg.

Crates must contain, so far as possible pipes of the same diameter, length, composition and thickness. Pipes are to be wrapped in polyethylene sheet and packed tightly inside the crate.

Pipes over ½" (15 mm) and up to 6" (150 mm) in diameter are to be made up into bundles that can easily be handled and stacked, with fastenings of twisted steel rope (4 strands) of a minimum thickness of 5 mm, positioned 1 m apart.

Internal pipe surfaces must be protected through closure of the two ends by plastic caps secured by adhesive tape. The bundles should contain pipes of the same diameter, thickness, composition and length.

Pipes over 6" (150 mm) in diameter will be despatched loose.

If necessary these pipes can be strengthened to prevent ovalization or deformation. The ends will be protected by pressure caps and taped or bolted to flange

Pipes in stainless steel, copper and aluminium must be packed in cases.

Pipes in PVC and glass fibre must be packed in wooden case protected against deformation during transport or ambient temperatures while stacked in the open.

Tubing for exchangers must be closed at the ends with wooden or plastic plugs, secured in bundles and packed in cases. The equipment must be wrapped in polyethylene sheet and held firmly in position inside the case.

Tubing for instruments will be packed in wooden cases secured by metal bands. Tubing with threaded ends must be provided with metal or plastic plugs to protect the thread.

3.4.4 Fittings

Flanges:

All flanges must be protected against oxidation (corrosion for the stainless steel types) by means of special semi-permanent grease.

Carbon steel flanges of small dimensions up to 6” (150 mm) will by threaded necklace fashion, placed in strong polyethylene or similar bags and packed in wooden cases (not exceed 1,000 kg in weight).

Carbon steel flanges over 6” (150 mm) must be assembled in piles held together by at least tie-bolts, and packed in wooden crates.

Discs of soft material must be interposed between the flanges.

Stainless steel flanges must be pre-packed in the manner described for carbon steel flanges and packed in cases. The flanges will be wrapped in polyethylene sheet inside the cases.

PVC and glass fibre flanges up to 4” (100 mm) will be packed in wooden cases and those of larger dimensions in wooden crates.

General fittings:

All fittings made of carbon steel, drawn, forged and, in particular, threaded, must be protected against oxidation (corrosion for the stainless steel types) by means of special long lasting grease and bevels should be provided of appropriate protections.

Fittings up to 6” (150 mm) will by threaded necklace fashion, placed in strong polyethylene or similar bags and packed in wooden cases (not exceed 1,000 kg in weight). Each bag will contain items of the same type.

Fittings over 6” (150 mm) will be arranged, unassembled, in wooden crates.

All fittings in stainless steel, copper and aluminium alloy pre-packed as described for fittings in carbon steel and packed in wooden cases.

Fittings in PVC and glass fibre, up to 6” (150 mm), will be packed in wooden cases and, those over 6” (150 mm) in wooden crates.

Accessories for tubing: All accessories for tubing (blinds, sealing, steam traps, hoses, spring supports, flow spy-hole, sprayers, etc. will be properly protected against corrosion with the application of a preservative, placed in polyethylene bags and packed in cases

3.4.5 Valves

Steel Valves: All valves must be protected against oxidization by means of special long lasting grease and flanges will be closed with laminated discs and rubber gaskets.

Gate valves will be dispatched in the closed position, but plug cocks must be open.

Valves of up to 4” (100 mm), as well as threaded necklace fashion and placed in polyethylene bags, will be in wooden cases.

Valves of over 4” (100 mm) will be packed in wooden crates after hand wheels and moving parts have been protected by means of polyethylene hoods and cushioning materials. Valves will be packed vertically to prevent damage to hand wheels or the hand wheels can be removed

Stainless steel valves: Stainless steel valves will be protected in the manner prescribed for carbon steel valves and packed in wooden cases.

3.4.6 Gaskets

Gaskets will be grouped by type, material and size.

Metal gaskets and ring-joints will be treated with long-lasting grease and individually wrapped in waxed, passivating crepe paper. Small-diameter gaskets will be placed in ventilated polyethylene bags, duly identified, then in waterproofed boxes and finally packed in wooden cases. Large-diameter gaskets will be attached to wooden frames and packed in wooden cases. The cases must contain instructions regarding unpacking of contents.

3.4.7 Equipment (vessels, columns, boilers, etc.) and Skids (complete plant package).

If the package is transported already assembled there is no need for Packaging as such. It will be sufficient for any projecting of especially vulnerable parts which cannot be dismantled to be protected by means of boxing and binding. All threaded connections must be fitted with plug, greased and bound with tape and flanges must also be closed using steel discs and rubber gaskets bolted to the flanges.

For prefabricated sections consisting solely of metal structures, suitable strengtheners in wood or iron must be provided to prevent permanent warping and/or deformation during the various stages of handling and transport. Stays, beams, crosspieces and lifting hooks must be applied at the most suitable positions for prevention of damage.

Any equipment required for transport and/or to place on board or unload the above packages, such as spreaders, saddles, sized ropes, stiffening structures etc., is included in the supply and the above mentioned equipments will follow the Goods to the final destination.

3.4.8 Steel Structures

Steel structures involving structures over 5 mm thickness will be tied in bundles that can easily be handled and stacked, with fastenings of steel rope of a minimum thickness of 5 mm. Each bundle should be provided with eyebolts for lifting purposes.

Structural work, unless otherwise indicated, must be appropriately grouped, with individual pieces being pre-welded to ensure they are sufficiently robust.

Welding operations must not impair in any way the soundness and usability of the items being dispatched, and not be undertaken for structural items that have been galvanized, treated with preservatives or any other surface preparation.

Structural work of a thickness under 5 mm should be packed in wooden crates.

Small items, such as brackets, tacking plates, rings, hooks, etc., should be packed in wooden cases.

Steps iron will be dispatched as follows: the step elements will be tied into bundles and the safety caging will be assembled at the installation Job-Site, and the calendared elements should be tied into bundles separately from the uprights, which should also be tied in bundles.

3.4.9 Linkage, Nuts and Bolts

Stays, nuts, bolts, metal inserts, etc., unless protected by other stable agents (galvanized, etc.) will be greased, sorted into types, enclosed in polypropylene bags and packed in wooden cases. Items must be identified by means of a label tied onto the outside of the sack, and another label placed inside.

Small sized nuts and bolts should be placed in cartons and packed in wooden cases.

3.4.10 Plates

Raw plate and shell-plate: Plates and shell-plates comprising a single package do not require any special Packaging. Planking or boards should be inserted as spacers between each plate to facilitate hoisting.

In stacking shell-plates, the first plate must rest on saddles or wedges to avoid any deformation.

Plates assembled in bundles must be held together with bands of stainless steel. If plates have no chamfers for welding, it is expedient to weld vertically pieces or straps onto the sides of the bundles to make them more compact. Wooden beams should be interposed between each bundle to facilitate lifting.

Stainless steel plates: Plates of this type must be packaged, secured with stainless steel bands and packed in wooden cases. A sheet of passivity or waxed paper must be laid between the plates.

3.4.11 Electrodes

Electrodes will be packed in wooden cases and pre-packed as follows:

Individual Packaging of electrodes will be marked with the denomination of the electrode they contain and its technical characteristics, wrapped in heat-shrunk polyethylene.

Packaging will then be placed inside heat-sealed bags into which moisture-absorptive agents have first been placed.

3.4.12 Tiles and Cements

Tiles: Ordinary and refractory tiles will be packed in wooden cases in a criss-cross pattern. Tiles will be protected by coverings of polyethylene, which will allow for the circulation of air. Cases must be strapped.

Refractory items in general must be packed in cases.

Cements: Ordinary and refractory cements must be placed in multilayer paper bags and then in a double bag of polyethylene and packed in wooden cases.

The volume of each Packaging should be one (1) m^3 approx.

3.4.13 Air Coolers

Fin surfaces must be protected on both sides with a layer of galvanized sheet, suitably attached to the cleat of the bale. Finned tubes must be suitably separated from one another by spacers to protect them during loading and unloading operations.

The detached parts of refrigerating units, such as hubs, driving shafts, bearings, etc., must be packed in wooden cases. Before being placed in the cases, parts must be carefully greased and wrapped in anti-corrosive waxed paper.

3.4.14 Electrical and Telecommunications Goods (electric motors, transformers, power-battery, telephone equipment, electrical equipment in general).

All Goods should be packed in wooden cases. MIL-B-131-F Foil bags and moisture-absorptive agents will be used in all cases. To prevent the protective bag from being damaged, any sharp edges on the equipment must be padded. In case of vulnerable parts of equipment that cannot be treated with protective substances, self-adhesive waxed paper impregnated with passivity substances can be used.

The main instruments on boards, panels and control desks, which are likely to suffer damage during carriage, handling or storage, should be dismantled and packed in cases. Panel coupling elements for medium and low voltage distribution boards and motor control panels will be packed in separate cases.

Accumulator batteries, appliances and instruments made of brittle materials must be given a form of protection inside the cases.

Switchboards and control panels must be packed as follows:

a) No case should contain more than three coupled panels or boards.

b) Arcing contact parts, if positioned in the contact-breakers and isolators, must be firmly secured; if they are being dispatched separately, each must be packed individually inside the case to avoid breakage of the contact.

Switchboards, control panels and control desks should be packed in wooden cases, together with all their accessories.

Motors will normally be supplied without the couplings. Motors will be firmly bolted down to the bottom of the case, and suitably protected. Junction boxes must be placed with the connection and coupling output channel towards the bottom. The drive shaft of the motor must be greased and protected.

Fluorescent lamps should be packed separate from the frames. They must be protected against possible breakage during loading, unloading, and transport. Frames must be packed in wooden crates separate from the lamps.

Mercury-vapour lamps and incandescent lamps must be provided with protection inside the case by means of spacers of poly-sponge or other suitable material.

Shunt and connection boxes must be packed in cases.

Large transformers must be packed in crates. It must be possible to fasten a sling through the transformer eyebolts even after Packaging. Any dismantled parts must be empty of oil and packed in cases. Measuring and control instruments must be dismantled and packed in wooden cases. The transformer must be bolted down to the base and held securely inside the crate to prevent it from moving.

Small transformers up to 2000 kVA, must bepacked in wooden cases.

3.4.15 Instruments (Control and safety valves, instrument and control panels, analysers, digital indicators, automotive valves, electronic computer systems, instrumentation in general, etc.)

Instruments equipment must be suitably packed in wooden cases.

Individual appliances must be packed in cases and enclosed in MIL-B-131-F Foil Bag. Apparatus must be cushioned before being placed in the bags.

Before the bags are sealed, moisture-absorptive agents must be inserted, and a partial vacuum must be created inside the bag.

Precision instruments must be wrapped in anti-corrosive waxed paper, padded and enclosed in protective bags in which moisture- absorptive agents have been placed; they must then be put inside a Packaging of foamed polystyrene of a suitable shape. The whole will then be placed in a water-resistant carton long-fibre natural craft board. The cartons must all be stowed next to one another inside a wooden case.

The Supplier of Goods is ultimately responsible to adhere to ALL regulatory requirements for Health, Safety and Environmental concerns of the Country of exportation and of importation (GSPLAJ), in regards all Goods used in export Packaging.

3.5 Packaging Inspection

Irrespective of the Delivery Term agreed in the Purchase Order, the preparation for export shipping (including Packaging) may be subject to inspection by Contractor or Contractor’s representative.

The Supplier shall give the Contractor written notice of no less than ten (10) days of the time and place at which the Goods are to be packaged for shipment.

The client or appointed representative may be present at Supplier's shop/factory prior to shipment and at dockside prior to loading aboard ship. Inspection shall not relieve Supplier of any responsibilities or obligations under the terms and conditions of the Purchase Order. Contractor reserves the right to reject the Packaging found not adequate during inspection. In such cases, Contractor will ask Supplier to immediately repack the Goods in acceptable Packaging for account of Supplier. If the Packaging rejection occurs at the port of loading, the repackaging activities must be carried out at dockside in the notified working day and all costs to obtain entry authorization by Port Authorities will be the responsibility of Supplier.

To obtain such authorization Supplier may contact the Contractor's appointed Forwarder.

If any part of the Goods for any reason whatsoever has not been inspected during the fabrication or before Packaging, the Contractor shall have the right to inspect the Goods at the agreed delivery point, provided that Contractor notifies Supplier of its intent to do so by their written order to proceed with the Packaging.

3.6 Packaging & Packaging Waste (European Union only)

All parties involved will comply with the European Packaging & Packaging Waste legislation in force (directive number 94/62/EC of December 20, 1994) or when situated outside the European Union the local legislation in force will apply.

4.0 MARKING INSTRUCTIONS

Each case, bundle, crate or container which is larger than two cubic meters shall be stencilled with indelible ink over coated with clear preservative on two opposite sides other than the side on which it rests or it is intended to be stacked, with the following marks in five centimetres letters and numbers, all in the English language. Packages smaller than two cubic meters may use labels reduced in size, and if necessary, the label may be affixed using a tag.

When an individual shipment consists of multiple cases, skids, crates, containers or other then each shall be individually and sequentially numbered.

All boxes and crates shall bear the following markings:

a) Name of Contractor
b) Project Name, Contract and P.O. numbers
c) Port of Destination
d) Equipment Tag Number (to be specified by the Supplier)
e) Name of Supplier
f) Seller's Ref. Number (to be specified by the Supplier)
* g) Case Number _____ of _____
(Continuous series)
h) Dimensions in meters (width, length, height, to be specified by the Supplier)
i) Volume in Cubic Meters (to be specified by the Supplier)
j) Gross Weight in Kilograms (to be specified by the Supplier)

k) Net Weight in Kilograms (to be specified by the Supplier)
l) Colour Codes, when required (to be specified by the Supplier)

In accordance with the characteristics and different requirements in loading, unloading and shipping different Contract Equipment, the package shall be conspicuously marked with "Handle With Care", "Right Side Up", "Keep Dry", etc., in English and with appropriate international trade practice marks and illustrative marks, such as (Please refer to attachment D):

a) Chains

Indicates the place through which lifting chains are to be passed for loading and unloading. The chain shall be painted red.

b) Cross Sign

Indicates the centre of gravity of the case.

c) Umbrella

Indicates that equipment must be stored in a warehouse with extreme care.

d) Glass Cup

Indicates that the shipment is fragile and should be handled with extreme care.

e) Slinging Points

Seller shall indicate sling points and/or furnish slinging diagram

To facilitate identification of the contents, in case of breakage or deterioration of packaging, the packed equipment or machine should be also marked on one of its sides, and, if this should not be possible, marks shall be stamped on corrosion resistant sheet metal or other suitable corrosion resistant material, which shall be fixed to the equipment in such a way, as to avoid being detached during handling.

In the case of goods which, because of their nature, are customarily supplied and accepted by the Contractor without packaging, marks and indications, shall be stamped on two sides of the equipment as described above.

All unpacked equipment, cases, parcels or bundles weighing more than 4 (four) metric tons, shall bear indications of their center of gravity using international symbol and of the appropriate places though which lifting braces are to be fixed for the adequate handling during loading, transfer and unloading operations.

All cases, crates and bundles weighing a metric ton or more shall have a mark, indicating the maximum load that can be placed on top of them.

One set of packing lists shall be in a waterproof bag affixed to the case, bundle, crate, or container and covered with a metal plate. This metal plate must be placed in the left top quarter of one of the largest surfaces and firmly affixed. One additional copy of the packing list shall be included inside the case, crate, or container.

International symbols are to be stencilled using indelible red ink over coated with clear preservative to prevent erosion. Any crate(s) identified as containing dangerous goods are to be prepared as a shipment separate from the main consignment and shall contain a separate set of packing lists. Appropriate markings identifying the contents, the product identification numbers, and any other markings required for the transport of dangerous goods shall be clearly affixed to or stencilled on the crate(s) on the two opposite sides other than the side on which the crate rests or is intended to be stacked. On cylinders the safety marks must appear on shoulder.

The colour to be used shall contrast with the package surface (never use yellow or red paint).

Black or white paint are recommended.

Packages/equipment of five tons or more must be marked with slinging points and also clearly show on all sides the centre of gravity (CG). This is of paramount importance for Pressure Vessels and Heat Exchangers.

Packages containing Hazardous Material / Dangerous Goods are to be marked on at least two sides with appropriate labels in conformity with IMDG/IATA regulations. Chemicals/ Dangerous Goods shall be identified on a separate invoice, packing list and Bill of Lading. All hazardous Goods shall be identified by appropriate hazard class and technical/proper shipping name (Refer to attachment F).

All spare parts orders must be clearly marked as spares and shall not be included with main equipment.

Shipping marks must appear on all packages and all shipping documents such as packing lists, invoices.

Bundles and loose items which are not suitable for application of shipping marks directly onto bundles or pieces, must be supplied with at least 2 (two) indestructible labels, 1 (one) at each end, bearing shipping marks. Labels are tied firmly to bundles with pieces of steel wire.

Metal or other weatherproof tags shall be clearly legible and must invariably be affixed to bundles and single units at both ends. Do not use linen, paper or light cardboard tags.

Hand lettering with felt tip markers is not acceptable.

Precautionary statements will be stencilled on each package to indicate proper handling and storage.

MINIMUM REQUIREMENTS

----------60 cms x 40 cms----------

Marks:

Consignee	:	AAAA
Project Number	:	Job No. XXXX
Final Destination	:	BBBB
P.O. No.	:	
Supplier's Name	:	
Country of Origin	:	
Item No.	:	
Description of Material	:	
Package No.	:	1 of ..., 2 of ..., etc.
Gross Weight	:	Kg
Net Weight	:	Kg
Dimensions	:	cms (L x W x H)
Volume	:	CBM

Storage Recommendations:

Cargo Handling Symbol:
(Identify / describe)

Special Instructions:

Stencil on two sides and one end in clear characters at least 5 centimetres high (where case size permits, otherwise use optimum size for each package dimension).

For the identification of Goods subject to special handling, the following international symbols shall be used to ensure proper handling and warehousing (see Attachment 0):

Symbol	Description	Remarks (symbols to be shown on)
1	THIS SIDE UP	All Top corners
2	FRAGILE GOODS – HANDLE WITH CARE	All Top corners
3	KEEP DRY	All Top corners
4	PROTECT FROM SOLAR RADIATION	All Top corners
5	USE NO HOOKS	All sides
6	CENTRE OF GRAVITY	Two sides of packages over 2,000 kg
7	SLING HERE	All slinging points

Special remarks: symbols 15 cm high to be painted in black, on bright surface.

All boxes and crates are to be marked clearly on all four sides:

"HANDLE WITH CARE"
"RIGHT SIDE UP" and
"KEEP DRY"

5.0 PACKING LIST GENERAL REQUIREMENTS

The Supplier will not ship Goods and materials from the point of origin, regardless of the delivery terms included in the Purchase Order, until the final release for shipment is issued to the Supplier by the Contractor's Representative.

90 (Ninety) days prior to the Contractual shipping date, Supplier must supply the Contractor with 4 (four) copies of shipping drawings for each large piece exceeding 10,000 kilograms or 12.2m L x 3m W x 2.7m H meters.

The shipping drawing must show at least the following information;

- Purchase Order No.
- Item No.
- Overall Dimensions (length x width x height)
- Total Weight
- Centre of Gravity
- Lift Points
- Any Special Lifting Requirements (i.e., use of lifting beam)

Supplier must submit a “provisional packing list” (provisional packing list is to include estimated weight and dimensions of all packages) 30 days prior to scheduled shipping date which must include the following information:

- Confirmation of Purchase Order shipping date.
- Quantity
- Description
- Reference Tag Number (where applicable)
- Supplier’s reference part number and serial number if applicable.
- Estimated gross weight (kilograms) of each shipping item (crate, skid)
- Length, width and height (meters) of each shipping item (crate, skid)

30 (Thirty) days prior to the Contractual shipping date, Supplier must furnish Contractor a copy of safety information for all easily combustible Goods, dangerous Goods and poisonous Goods.

These safety instructions must include the following information:

- Name of Goods
- Nature of Goods
- Measure of protection
- Emergency treatment
- Material Safety Data Sheets
- IMCO Code
- UN Product Code

30 (Thirty) days prior to the Purchase Order shipping date Supplier must furnish Contractor with a description of the "special precautions" to be taken for the equipment/material with special requirements for temperature, shock, etc., during the transportation and storage.

Upon the receipt of the release for shipment from the Contractor Inspection group, the Supplier will be obligated to submit the final packing list (c/w weight and dimensions) to the Contractor.

Any shipment that proceeds without an authorized order (release for shipment) will be subjected to charges not exceeding the freight charges.

Item numbers shall be listed accurately on the packing list to allow proper identification.

The packing list shall indicate details of the items packed, piece by piece, accessory by accessory (Purchase Order line item level). Indication of sets, lots or the like is not allowed.

Whenever packages are stuffed into containers, details of their contents shall be listed.

Monetary value shall never be indicated on any packing list.

One copy of the packing list shall be placed inside the box and two copies of it shall be fixed to the outside of the packing in a waterproof envelope protected by a plastic or aluminium cover, marked “packing list”.

6.0 STORAGE RECOMMENDATIONS

The Supplier’s storage recommendations shall be marked on each Package and indicated on the packing list.

The symbols for the type of storage are:

- X or “A” = storage in heated/ventilated warehouse and with special precautions (air conditioning)
- XX or “B” = storage in closed warehouse
- XXX or “C” = storage in open shed
- XXXX or “D” = storage in open air (covered by tarpaulins)

If for any reason, Contractor is unable to accept dispatch of the Goods at the time when the Goods are due and ready for dispatch, Contractor shall so inform Supplier in writing and Supplier shall store the Goods, safeguard it, and take all steps to prevent its deterioration during such storage and Contractor shall be liable to Seller:

a) if applicable, for that instalment of the Contract Price that would have been paid in accordance with the Contract had the Goods been dispatched and

b) for the reasonable justified costs, including insurance of so doing, after a period of grace of 2 (two) months free storage (unless otherwise specifically provided).

7.0 OCEAN FREIGHT TRANSPORTATION

7.1 Ocean Containers

Contractor will position the Shipping Company containers c/o Supplier’s shop/factory and all costs for containerization of the Goods (stowing, securing, stuffing, etc.) will be for account of Supplier.

The material to be loaded into containers must be packed according to point 3.3.6.

Container inspection, loading, securing and limitations will be in accordance with International Standards and Maritime Law & Regulations, regardless of the country of export.

Material is to be bundled, boxed or crated restricting weight to a gross maximum of 4 metric tons. After cleaning and preserving, all equipment shall be packed in waterproof paper lined export type shipping containers.

Large pumps, compressors, and other heavy machinery that will not be damaged by water or exposure may be packed in open crates or semi-boxed. All openings of pipe,

large valves, and machinery must be protected by wooden or PVC covers or plugs, and the machined threads must be covered by caps or wrapping to protect against damage in transit.

Up to 225 kg

Boxes for weight of contents up to 225 kg shall be constructed with minimum 2.54 centimetres cleats and of nominal 2.54 centimetres lumber or equivalent plywood, and shall be strapped with two 1.90 centimetres unannealed flat steel strapping secured with crimped steel seals.

225 kg to 500 kg

Boxes for weight over 225 kg to 500 kg shall be constructed of nominal 2.54 centimetres lumber or equivalent and be modified to include a skid base of nominal 2.54 centimetres deck, nominal 5 centimetres x 10 centimetres lumber skids and minimum 5 centimetres x 10 centimetres frame members. Boxes shall be strapped with a minimum of two x 3 centimetres unannealed flat steel strapping secured with crimped steel seals.

501 kg to 4000 kg

Boxes for weight in excess of 500 kg shall have skid type bases. These skids shall be minimum nominal 7.5 centimetres x 10 centimetres or 10 centimetres x 10 centimetres lumber secured to headers with 1.25 centimetres machine bolts. The deck shall be of nominal 2.54 centimetres lumber or heavier. Framing members of the sides and ends shall be of nominal 5 centimetres x 7.5 centimetres or heavier. The sheathing shall be of nominal 2.54 centimetres lumber or plywood equivalent.

Top construction shall be of nominal 2.54 centimetres lumber with waterproof paper liner supported by minimum 5 centimetres x 10 centimetres lumber joists on edge, where the width of the case so requires, and cleared to the sides. The corners of prefabricated panels shall be reinforced by the addition of 3 centimetres steel straps where necessary.

Over 4000 kg

Where the weight exceeds 4000 Kilos, all construction will be in accordance with above specification however material used is to be altered as the weight is increased.

Ventilation shall be provided in all shipping containers to permit free circulation of air by spacing of floor boards 0.63 centimetres to 0.48 centimetres apart and by drilling a cluster of holes in the sides of large cases upward from the outside at 45°. These should be a minimum of five such holes 1.25 centimetres in diameter.

Heavy machinery shall be mounted and bolted to the skid which shall be of sufficient strength to provide support and to prevent distortion.

TABLE OF SKID SIZES

Gross load Weight (kg)	Max. skid Length (m)	Runner size (centimetres)
225-450	2.44	5 x 10
451-1,000	4.88	7.5 x 10
1,001-5,000	6.10	10 x 10
5,001-10,000	9.15	10 x 15.25
10,001-15,000	9.15	15.25 x 15.25
15,001-25,000	9.15	15.25 x 20
25,001-36,000	10.67	20 x 20
36,001-45,500	10.67	20 x 25

All skids will be spaced no greater than 1.22 metre apart, centre to centre. The headers will be the same size as the skid runners and shall be bolted into each skid runner. The deck of the skid shall be a minimum of 5 centimetres lumber. All internal frame work shall be a minimum of 10 centimetres lumber and shall have diagonal bracing.

If the length exceeds the limit shown in the table above the next larger size is to be used.

7.2 Break-Bulk Cargo (Conventional)

In general, break-bulk cargo is any ocean cargo which is not containerized, exceeds the inside dimensions and weight limitations set for specific types of containers or otherwise designated as such, as per the delivery requirements specific to the project.

8.0 AIR FREIGHT

Cardboard Containers

Cardboard containers may only be used for airfreight, if they meet IATA packaging requirements. Otherwise, any material packaged in cardboard containers must be repackaged or enclosed in another crate or bundle.

Machinery Boxes

Material is to be bundled, boxed or crated restricting weight to a gross maximum of 2,720 kg. All openings of pipe, large valves, and machinery must be protected by wooden or PVC covers or plugs, and the machined threads must be covered by caps or wrapping to protect against damage in transit. Maximum size for boxes or crates is not to exceed 152.4 cm D x 274.3 cm W x 152.4 cm H.

Up to 225 kg

Boxes for weight of contents up to 225 kg shall be constructed with minimum 2.54 cm cleats and of nominal 2.54 cm lumber or equivalent plywood, and shall be strapped with two 1.9 cm unannealed flat steel strapping secured with crimped steel seals.

225 kg to 500 kg

Boxes for weight over 225 kg to 500 kg shall be constructed of nominal 2.54 cm lumber or equivalent and be modified to include a skid base of nominal 2.54 cm deck, nominal 5.08 cm x 10.16 cm lumber skids and minimum 5.08 cm x 10.16 cm frame members. Boxes shall be strapped with a minimum of two – 3.18 cm unannealed flat steel strapping secured with crimped steel seals.

501 kg to 2,720 kg

Boxes for weight in excess of 500 kg shall have skid type base. These skids shall be minimum nominal 7.5 centimetres x 10 centimetres lumber secured to headers with 1.25 centimetres machine bots. The deck shall be of nominal 2.54 centimetres lumber or heavier.

Framing members of the sides and ends shall be of nominal 5 centimetres x 7.54 centimetres or heavier. The sheathing shall be of nominal 2.54 centimetres lumber or plywood equivalent.

Top construction shall be of nominal 2.54 centimetres lumber supported by minimum 5 centimetres x 10 centimetres joists on edge, where the width of the case so requires, and cleated to the sides. The corners of prefabricated panels shall be reinforced by the addition of 3 centimetres steel straps where necessary.

SKIDS

Heavy machinery shall be mounted and bolted to a skid which shall be of sufficient strength to provide support and to prevent distortion.

TABLE OF SKID SIZES

Gross load Weight (kg)	Max. skid Length (m)	Runner size (centimetres)
225-500	12.70 x 24.13	5 x 10
501-2,720	12.70 x 24.13	7.54 x 10

All skids will be spaced no greater than 1.22 metre apart, centre to centre. The headers will be the same size as the skid runners and shall be bolted into each skid runner.

The deck of the skid shall be a minimum of 2.54 centimetres lumber. All internal frameworks shall be a minimum of 5 centimetres lumber and shall have diagonal bracing.

Contoured Structural Container / Igloo

Contoured containers/Igloos shall be constructed as described below:

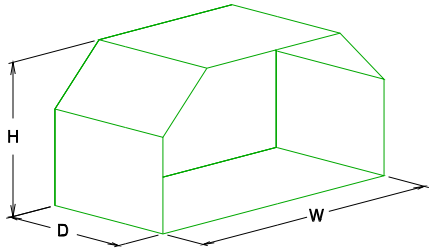


Figure 1: AWS type container

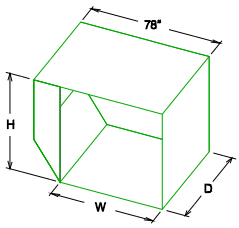

Figure 2: AVE type container

Class	Size	IATA Description
AWS	Full	Maximum gross weight (including tare) 2,720kg 1.55 m L x 3.17 m W x 1.62 m H Vol: 7 cubic meters
AVE	Half	Maximum gross weight (including tare) 1,590kg. 1.55 m L x 1.58 m W x 1.63 m H Vol: 4 cubic meters

Containers shall have skid type bases. These skids shall be a minimum nominal of 7.54 centimetres x 10 centimetres lumber secured to headers with 1.25 centimetres machine bolts. The deck shall be of nominal 2.54 centimetres lumber or heavier. Framing members of the sides and ends shall be of nominal 5 centimetres x 7.54 centimetres or heavier. The sheathing shall be of nominal 2.54 centimetres lumber or plywood equivalent. Top construction shall be of nominal 2.54 centimetres lumber supported by minimum 5 centimetres x 10 centimetres joists on edge and cleared to the sides. The corners of prefabricated panels shall be reinforced by the addition of 3.17 centimetres steel straps where necessary.

9.0 HAZARDOUS MATERIALS & DANGEROUS GOODS

Transportation of these good must comply with all International, Federal, Provincial, State and municipal regulations.

For any materials or residues which are deemed by the appropriate transport regulatory authorities to the hazardous or regulated cargo for transportation, the Supplier must provide the Contractor in writing, with advance notice, the following safety instructions:

i. Name of goods
ii. Nature of goods
iii. Measure of protection
iv. Emergency treatment
v. UN Number
vi. IMCO code
vii. Safety Data Sheets
viii. Spreader Bar details c/w Certified Calculations

All hazardous goods must be packaged in accordance with appropriate transportation mode rules and regulations. Supplier must ensure all shipping units comply with the packing/packaging provisions of the International Maritime Dangerous Goods (IMDG) or International Air Transport Association (IATA) code, as appropriate to the mode of transportation. Supplier must ensure that hazardous materials, especially liquids, are in suitable containers that will allow use without spillage and can be satisfactorily resealed after a portion of the material has been extracted. (Re-closed containers should allow normal handling and transport without significant escape of liquids or vapours. Containers of 5 liters or more of hazardous, low-viscosity liquids such as paint thinners, chlorinated solvents, and insecticides should have a retractable metal or plastic spout or a similar design that will meet the stated objective).

Ensure all packages are properly and adequately marked and labelled in compliance with provisions of the IMDG or IATA code and properly display safety marks, product identification number(s), and any other information required by the regulations governing the transport of dangerous goods.

The Supplier must assist the Contractor in obtaining all necessary certificates and permits.

These requirements also affect the transport of solvents, pre-mixed paint, equipment with batteries, oil filled equipment, magnetized materials, pressurized equipment or containers, etc. The specific mode of transport being employed and the quantities involved may determine if the cargo is classified as dangerous or not.

Thirty (30) days before the consignment is due to be dispatched, the Supplier must send to the Contractor the following documents for each product:

- Multimodal dangerous Goods form for sea freight transport correctly completed and signed
- Shipper's declaration for airfreight transport correctly completed and signed
- Material safety data sheet

Hazardous material shall be identified on a **separate invoice and packing list** to those for non-hazardous material. All hazardous material shall be identified by the appropriate hazard class and technical or proper shipping name. All invoices and packing lists for hazardous material shall contain the following statement:

"*This is to certify that the above-named material is properly classified, described, packaged, marked and labelled, and is in proper condition for transportation according to the appropriate Government or International Transport regulations.*"

NAME	COMPANY NAME
TITLE	SIGNATURE
HAZARD CLASS NO	TECHNICAL SHIPPING NAME

The Supplier shall produce any necessary hazardous cargo certificates, in accordance with the appropriate Government and International Transportation regulations for all shipments.

10.0 Heavy Lifts / Oversized Cargoes (Abnormal Loads)

Goods exceeding one of the following dimensions and/or weight are to be considered to be heavy lifts and/or oversized cargoes.

Loads

Length : 12 meter
Width : 2.50 meter
Height : 2.50 meter
Weight : 25 Tons

If the above-mentioned figures will be exceeded, Supplier must give advance notice to Contractor and shall present to Contractor transport and lifting drawing(s).

Plus showing, other information below:

- Purchase Order/Tag number.
- Weight and dimensions of each piece.
- Centre of Gravity (CG).
- Lifting lugs and/or sling locations.
- Size of lugs.
- Saddle locations (incl. width, height and weight).
- Any specific transport requirements.

Drawing packages are to be provided by Supplier (numbers to be determined on a case-by-case basis by the Contractor), a minimum of 90 (ninety) days prior to "Ready for Shipment" date.

Heavy-lifts and/or over-sized Goods shall be accompanied with "spreader bars" whenever required by the Contractor or the Job-Site. The Supplier will specify each item with lifting and sling points that will distribute the load equally and keep the item in a stable, horizontal position when lifted by one hook. All items up to 125 tons are to be designated for a single point lifting method.

11.0 Domestic Packaged Shipments

10 (Ten) days prior to the contractual shipping date, Supplier must provide (via Courier Express or email) two copies of the shipping documents to the Contractor addressed as follows:

- Contractor (As agents or as representatives for – when applicable)
- Contractor's Buyer, (project office address)

Attention: Document Controller, Project: (project number and project name).

At time of shipment, a final packing list shall be prepared by Supplier for each package, showing the equipment / material description and appropriate tag number where applicable. **1** (**One) copy** of the packing list shall be placed inside the shipping container / crate affixed to the equipment / material, **1** (**One) copy** shall be secured in a weatherproof pouch firmly attached to the outside of each crate/pallet etc.

12.0 INTERNATIONAL SHIPMENTS

12.1 For shipments destined to Canada:

a) 2 (Two) original copies of a Commercial Invoice with Harmonized System code per item,

b) 1 (One) original copy of the NAFTA Certificate with HS code per item,

c) If a NAFTA certificate is not available or not applicable, then two (2) original copies of a Certificate of Origin (if applicable)

d) Packing List and/or a separate packing list for each shipment (in this latter case the Commercial Invoice must indicate 'partial shipment' and be issued for each individual shipment, the total of which must equal the total shipment quantity/value).

e) Copy of truck bill, airway bill or bill of lading.

f) 1 (One) copy of each of the above to be sent to the Logistics Lead of the project or to the Buyer at the given address via email or courier, if no Logistics Lead is assigned to the project.

The 'Importer of Record' should clearly show: **********

It is the responsibility of the equipment Supplier to define and supply the HS Code description on the Commercial invoice and on the NAFTA Certificate. If the Supplier is unable to supply or is unsure of the HS code to be used, they must then contact the Project appointed Customs Broker for assistance.

In order to comply with Canada Customs Non-Compliance regulations, the Commercial invoice must imperatively show the following elements:

- Supplier name and details.
- Invoicing address.
- Purchaser / Consignee's name and details (XXX location purchasing the Goods).
- Delivery address, if different from consignee's address.
- Other references such as invoice and purchase order numbers.
- Country of Origin (a blanket certificate of origin or an affidavit might be asked upon request to prove the origin of the Goods). The terms "Manufactured in" and "Made in" are the only acceptable terms.
- Mode of transportation.
- Currency of settlement.
- Number of packages
- Specification of commodities (kind of package, marks and numbers, general description and characteristics such as proper identifying description in commercial terms).
- Unit and total price paid or payable in the currency of settlement.
- Invoice total
- Total weight
- Originator: name of the person completing the invoice.
- Customs Broker details and contact

12.2 For other International shipments

The following minimum documentation will be required for the clearance of all commercial shipments irrespective of the mode of shipment. This documentation is to be prepared and supplied by the SUPPLIER:

a) Commercial Invoice

1 (One) original and 2 (two) copies destined to Customs Broker.
1 (One)) copy destined to Contractor's Representative.

b) Certificate of Origin

1 (One) original and 2 (two) copies destined to Customs Broker.
1 (One) copy to Contractor's Representative

These documents must be sent to the following parties' indicating the Project name and Project number:

- Contractor (As agents or as representatives for – when applicable)
- Contractor's Buyer, (project office address)
- Document Controller
- Contractor's appointed Freight Forwarder

All documents must be received by the Customs Broker and Contractor Representative 15 (fifteen) days prior to the schedule date of arrival of the shipment. All documentation shall be addressed according to instructions issued by the Contractor.

Documentation for international shipments will vary depending on the importing Country requirements and existence of special trade arrangements between Country Nations.

Specific or additional documentation needs and completion instructions will be provided to the Supplier prior to any shipment being agreed upon and will be included as part of the Purchase Order (Special) Terms and Conditions.

In order to ensure that the above documents are verified properly in time for shipment, the original copies should be couriered. If the documents are not correctly completed the Supplier will be advised that new documents are needed. Shipments will not be expedited until all Import related documents are completed and in good order.

13.0 Export permits

The following requirements on Export Permits are applicable to all Projects where goods are being purchased.

The Supplier must advise the Contractor of all Export Permits required for the export of the Goods covered by the Purchase Order.

This is a condition of the validity of the Purchase Order that the required Export Permits for the Goods be issued in time for the scheduled delivery, failing which the Purchase Order shall irrevocably be deemed null and void, and Contractor shall in such event not be liable to the Supplier for any damages nor compensation.

The Supplier shall at its own cost obtain the required Export Permits.

Should the Contractor be the Exporter of Record, the Supplier shall, at its own cost, assist the Contractor in all aspects in preparing applications for the export permits and in obtaining the required approvals. Where, under the delivery term, the Supplier is responsible for obtaining the required export permits, the Supplier shall do so at its own cost.

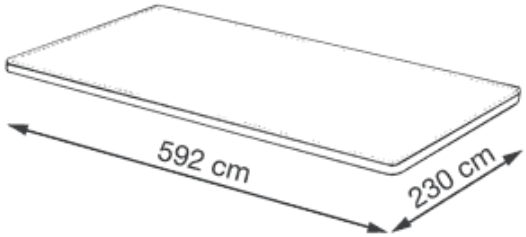
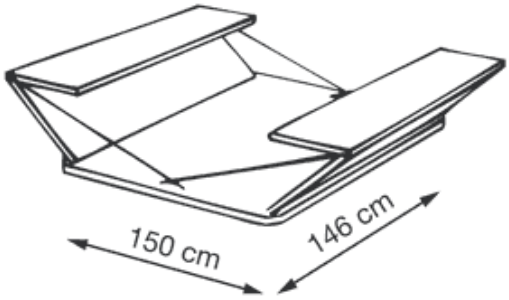
Type:	20-ft-Pallet
Code:	P7E, PGE
Base Dimensions:	606 x 244 cm
Internal Dimensions:	592 x 230 cm
Loadable in:	B747-200 Combi, B747-400 Combi, B747-200 SF, B747-200 F



A320/A321 Pallet

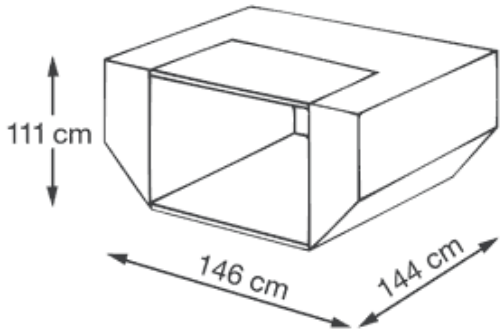
Type:	A320/A321 Pallet
Code:	PKC
Base Dimensions:	156 x 153 cm
Internal Dimensions:	150 x 146 cm
Loadable in:	A320/200, A321/100



Aircraft Container Sizes:

A320/A321 Container

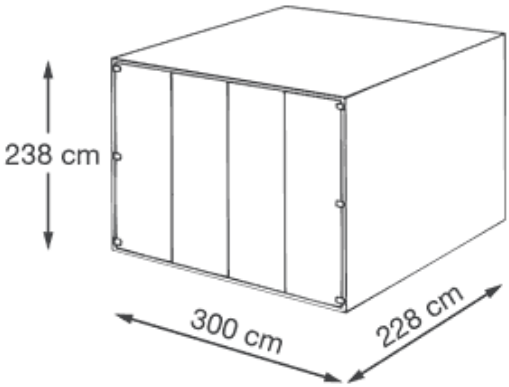
Type:	A320/A321 Container
Code:	AKH
Base Dimensions:	156 x 153 cm
Height:	114 cm
Volume:	3.5 cbm
Internal Dimensions:	146 x 144 x 111 cm
Loadable in:	A320-200, Airbus A321-100



10 ft Container

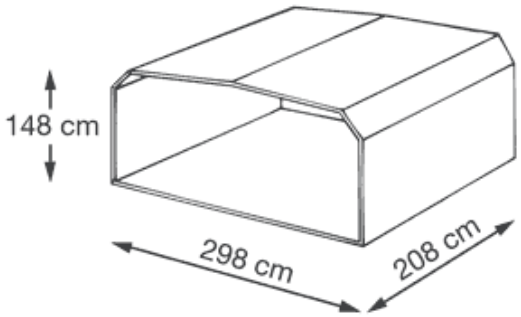
Type:	10 ft Container*
Code:	AQ6, AMA, AQA, AMG
Base Dimensions:	318 x 244 cm
Height:	244 cm
Volume:	17 cbm
Internal Dimensions:	300 x 228 x 238 cm
Loadable in:	B747-200 Combi, B747-400 Combi, B747-200 SF, B747-200 F

* Flexible doors/solid doors



AAN Container

Type:	AAN Container
Code:	AAN
Base Dimensions:	318 x 224 cm
Height:	156 cm
Volume:	9 cbm
Internal Dimensions:	298 x 208 x 148 cm
Loadable in:	A310-300, A300-600, A340-200, A340-300, B747-200, B747-400, B747-200 Combi, B747-400 Combi, B747-200 SF, B747-200 F, B737-300 F, DC8-73 F



AMF Container

Type:	AMF Container
Code:	AMF
Base Dimensions:	318 x 244 cm
Height:	163 cm
Volume:	13 cbm
Internal Dimensions:	398 x 234 x 146 cm
Loadable in:	A310-300, A300-600, A340-200, A340-300, B747-200, B747-400, B747-200 Combi, B747-400 Combi, B747-200 SF, B747-200 F

TABLE of CONTENTS

Executive Summary

Nalcor Energy is committed to develop the Lower Churchill Project (LCP or the Project) with complete dedication to minimizing the risks of injury or ill health to personnel and damage to property or the environment as low as reasonably practicable. Nalcor Energy believes that safety and health performance is fundamental to the achievement of project success, as well as its overall business and project objectives. It is therefore the Project Delivery Team's expectation and requirement that all personnel associated with the Project will play an integral role in the implementation of its occupational safety and health strategy, performing at the highest possible levels and fostering continuous improvement in the areas of safety and health.

This Safety and Health Plan provides guidance on how the Lower Churchill Project work scope can be safely executed. This Plan is focused for all levels of LCP management and specifically identifies the strategies and practices that project personnel will employ to ensure that health and safety performance excellence is achieved. Individual responsibility and total commitment to a strong safety culture are well defined and established elements for achieving Incident and Injury-Free performance on the Project are in place.

Nalcor believes sound health and safety performance is fundamental to successful business performance. It is therefore the requirement and expectation of the Project Delivery Team that all personnel associated with the Project shall play an integral part in the full implementation of the health and safety management strategy, performing at the highest possible levels and fostering a focus on continuous improvement in health and safety. Eliminating all work related injuries, while effectively managing and executing the project, is what ultimately defines us, as well as the overall success of the project.

Nalcor believes that achieving its safety commitment of "Zero Harm- Nobody Gets Hurt" requires a proactive health and safety management system is in place at the work-face level for all contractors and suppliers. The Health and Safety Management vision of the Lower Churchill Project is the ***"Relentless pursuit of an injury and illness free workplace where nobody gets hurt."*** Project excellence is not achievable without performance excellence in safety.

Key Focus Areas:

Nalcor recognizes that the following focus areas of the health and safety program are the key to the success of its Health and Safety effort. All Health and Safety Plans associated with the Project should include the following key focus areas and the intent of the initiatives:

- Management Commitment: Management must convince the workplace that safety is a core value by actively and visibly participating in the health and safety effort and by providing adequate resources.
- Workplace Participation: All personnel must actively participate in the health and safety effort to promote understanding, ownership and commitment.
- Effective Communication: Open and honest communication across all levels of personnel, supervision and management must be achieved. The safety process must reinforce and foster mutual feedback and respect.
- Positive Reinforcement: Positive reinforcement and constructive feedback must be promoted to ensure that desired worksite behaviors occur frequently.
- Performance Measurement: Leading indicators must be captured, analyzed and communicated to indicate how the workplace is proactively committed to the achievement of an injury/incident free working environment.
- Caring about the Worker: Focus must be placed on the worker as an individual. A work environment, which is safe and maintains a high level of employee morale and positive attitude must be created and maintained.
- Empowerment: Personnel must be empowered to immediately stop any unsafe behaviors or conditions that they find during the course of their work. Personnel must correct these unsafe behaviors or conditions as soon as practicable.
- Accountability: All personnel must understand that each individual is responsible for his or her own safety. First line supervision must understand that they are accountable for the safety of their direct reports and that they must undertake the coaching role.
- Competency: All personnel must be fully competent to perform their daily work activities in a safe and productive manner.
- Pro-activity: A pro-active approach to the health and safety effort must be emphasized and practiced. This will allow unsafe workplace behaviors and conditions to be addressed before they turn into incidents.
- Risk Management: A process to identify and mitigate hazards must be implemented. When hazards are identified, steps must be taken to eliminate or reduce exposure by designing in safety, changing work procedures, requiring additional PPE or raising safety awareness.

- Systemic Approach: Ensure that all systems are designed to include a clear description of scope and objectives; processes and procedures used in the work activity, identify workers and management responsible for the execution of the processes and procedures, a measurement and verification process and a feedback system that analyses measurement and verification information for continuous improvement.
- Partnership: Learn from others to evaluate and implement the best possible health and safety practices used for implementation.

Key Strategies for Achieving the Project's Safety Management Vision

1. *Ensuring clear accountability for safety performance with line management. This may be accomplished through:*

- Clearly defined roles and responsibilities within the job description of each member of line management;
- The establishment of Safety performance targets for each member of line management;
- Periodic performance reviews (at least annually) shall be carried out to assess overall safety performance and accountability of line management; and
- Line management health and safety performance initiatives, creativity and timely achievement of established targets will be recognized/rewarded, as appropriate. Poor overall performance will be noted and discussed with individual with an action plan to enhance overall performance.

2. *Implementing a formal leadership training program for all levels of management and supervision. This strategy will be accomplished by ensuring that:*

- All project management and supervisory personnel attend and actively participate in the SLI safety leadership training program as soon as practicable.
- Project management and supervisors are encouraged to attend follow-up training sessions as and when provided.
- All Leadership Training Program attendees are encouraged to implement lessons learned from the training into the work environment, as well as engaging others in working discussions with Health and Safety as the issue.
- Leadership is encouraged to interact with other leaders/managers to discuss lessons learned and implementation strategies.

3. *Demonstrating tangible commitment and involvement by Senior Management towards the "relentless pursuit" of safety performance excellence is essential. This will be realized by:*

- Providing the appropriate level of resources, equipment and personnel to execute each work task safely.
- Actively participate in FELT Leadership, which includes strong, visible management commitment; recognizing management's role of being a teacher, trainer and coach; always maintaining effective communications; and undertaking timely and meaningful auditing and re-evaluation processes.
- Establishing and maintaining Health and Safety as our core value through continually safeguarding the well-being of project personnel, the general public, and the environment through safe and environmentally responsible work practices associated with the design, construction, transportation and commissioning. Health and Safety must not be prioritized along with other business priorities.
- Continually striving to maintain an accident and incident free working environment at all project and contractor work sites, and ensuring total compliance with all Health and Safety applicable regulations.
- Always challenge and correct wherever possible any Unsafe Acts, Conditions or Procedures in a timely manner;
- Be actively involved in the SWOP process.

4. *Selecting competent contractors for executing the work, while coaching and guiding them in the delivery of the Project in order to achieve our Vision. This is best accomplished by the following:*

- The Project Delivery Team, through line management will ensure that contractor Health and Safety performance is monitored and unsatisfactory Health and Safety performance and mitigating action are addressed in contract terms and conditions and duly executed as and when appropriate.
- The Project Delivery Team will ensure an effective and workable procedure is in place to evaluate and select third party services by: Ensuring that prior to commitment the risks are appropriately reviewed, mitigating measures identified/addressed;
- The Project Delivery Team will define third party performance expectations, communicate and monitor contractor performance requirements that:

- Establish and execute contracts and agreements that clearly incorporate Health and Safety requirements;
- Become actively involved in monitoring, mentoring and coaching Contractors, Ensure Contractors' roles and responsibilities are clearly defined;
- Establish Health and Safety performance targets, metrics and measures; Ensure Health and Safety performance with contractors are regularly reviewed and communicated and Integrate appropriate actions/performance enhancement plans to improve overall contractor performance.
- The Project Delivery Team and Line Management will periodically coordinate and/or conduct internal and external Health and Safety audits on contractors and third party performance.

5. *Involve all workers in safety management. This will be initiated by the following:*

- Ensuring that all employees and contractor understand that they have a stake in the overall success of the project --- Health and Safety is everyone's responsibility.
- Actively encourage employee involvement by holding them accountable and ensuring everyone does their part through periodic monitoring, inspections, assessment and audits.
- Encouraging participation into the Joint Occupational Health and Safety Committee (JOHS).
- Incorporating daily safety inspections as part of the employee/contractor job task.
- Ensuring employees and contractors are informed about safety inspections, injury and illness statistics, and other safety-related issues.
- Management and line supervisors should assign meaningful tasks to employees and contractors that support safety.
- Management and line supervisors should place value in employee/contractors input and feedback with regard to improving the safety and health program, as they often know more about safety problems and solutions than managers do.
- Holding employees accountable by:
  - Including safety and health responsibilities in job descriptions; including compliance with safe work practices a part of performance evaluation;
  - Setting and measuring achievements toward meeting safety targets;
  - Ensuring employees/contractors with reckless or unsafe behaviours are appropriately disciplined and recognizing employees and contractors who contribute to keeping the workplace safe.

6. *Utilizing safe work practices/behaviors to avoid accidents. This is best accomplished utilizing the following practices:*

- Site Health and Safety Orientations must be carried out prior to work commencement at the construction site. The Health and Safety orientation is the most important communication tool that management has to clearly convey the safety expectations and responsibilities of the job task and working environment. To ensure everyone knows how hazards will be effectively identified, communicated and controlled.
- Ensure safe work practices are clearly defined, documented and communicated to employees and contractors.
- Utilize SWOP *(Safe Workplace Observation Program)* as a means of not only recognizing unsafe work practices and behaviours, but recognizing the application of safe work practices and behaviours. *Please refer to Appendix "C", page 76 for additional information about the SWOP.*
- Incorporate and communicate Lessons Learned from incidents and near misses. Encourage reporting and investigating near-miss incidents and gleaning lessons learned and communicating them to other potentially affected personnel.
- Target safe work practices and procedures with the primary goal of eliminating incidents and injuries in the workplace.
- Employ frequent opportunities for reminders of established safe work practices and behaviors to employees and contractors.
- Solicit feedback and input from employees and contractors regarding enhancement of safe work practices/behaviours for tasks they are frequently involved with executing. Ensure that this feedback is heard, evaluated, addressed and timely feedback is provided in all cases.
- Review safe work practices periodically (at least annually) to ensure they are effective, meet regulatory requirements.

7. *Risk management and control practices can best be incorporated in daily work activities utilizing the following practices:*

- A TBRA (task-based risk assessment) is a risk management tool that should be used to evaluate risk prior to a new or complex work activity. The TBRA identifies personnel interaction with the work activity, the tasks to be performed, and the hazards associated with those tasks. The TBRA identifies known and potential hazards and emphasizes risk reduction.

- Step Back 5X5 is a process that that encourages workers to identify hazards associated with all tasks before starting a job. It helps to promote a hazard management culture through continual self-evaluation. It is based on the principle of "engaging the mind before engaging hands" by: Stepping back 5 paces from the job; Investing 5 minutes (nominal) to step through the job mentally and identify plans to control hazards before starting the job. It is an informal personal planning process and essentially a mental JHA applied before starting all jobs.
- Systematically listen to those personnel that understand the risks of a particular task not only when a crisis occurs, but as the right way to manage activities on the project.
- Develop safe working rules, practices and procedures based on risk experience, safety knowledge and competent work direction.
- Assess all anticipated known risks prior to starting a new activity or one that is conducted very rarely.
- Ensure employees and contractors are effectively trained in risk management practices and procedures, as well as actual application of risk management in actual practice. This includes processes, methods and tools available.
- Stimulate and maintain the desire and commitment of line management, contractors and employees to perform risk management practices in daily work activities.

8. *Establishing strong functional expertise in health and safety management who are fully engaged in both strategic direction-setting and day-to-day project delivery activities. This can be accomplished by the following:*

- Selecting trained, capable, educated and experienced health and safety personnel to provide appropriate guidance and direction for the overall health and safety management effort strategically and on a daily basis.
- Providing strong functional and technical expertise to support the execution and implementation of health and safety practices, policies, and processes relative to contractor and employee safety.
- Focusing function and technical support on effective contractor Health and Safety management throughout the course of the project.
- Preparing and reviewing project safety and security management plans.
- Supporting the project level execution of contractor qualification and performance assessment processes.
- Supporting and contributing to the health and safety performance reporting processes.
- Supporting and facilitating construction, contractor and employee Health and Safety training.

- Monitoring regulatory developments, evolving issues and industry best practices, and proactively facilitates the continuous improvement of the Major Projects health and safety management system.
- Providing coaching and mentoring to applicable Project Management to enhance Major Project's Health and Safety objectives.

9. *Focus on measuring leading indicators (e.g., field observations, interventions and worksite inspections. This can be achieved through due consideration of the following:*

- Project Management actively supports the concept of utilizing leading indicators as a measure for proactively controlling loss/damage.
- A 'balanced scorecard' providing information on a range of Health and Safety activities will be utilized for the project rather than a single performance measure.
- Measurement of leading indicators provides information on how the Health and Safety Management System operates in practice, and identifies areas where remedial action is required and provides a basis for continuous improvement and provides a mechanism for feedback and consequential motivation.
- Employees and Contractors must clearly understand exactly what proactive/leading indicators are being measured and what significance the use of the measurement will have on producing the desired performance result.
- Leading indicators are to be utilized as a means of publicizing data with the project workforce which focuses attention on a particular program area and is by doing so will lead to safety improvements in a short period.
- Key Project activities in the Health and Safety Management System that need to be promoted, reinforced and visibly drive the culture will be selected and measured, wherever possible.

10. *Development of an incident management and emergency response management plan/program that reflects the uniqueness/specifics of the work and associated work locations. This can be achieved with consideration of the following:*

- Identifying all reasonable/probable risk events/scenarios specific to the Lower Churchill Project that may require incident management and/or emergency response. Examples for the LCP will include (but not limited to): fire, explosion, flooding, civil unrest, equipment failure, vehicle/transportation incidents (including helicopter incidents), extreme weather, missing or lost personnel.

- Ensuring adequate resources are available at the site location or, where possible, mutual aid agreements are established which would allow appropriate resources to be moved to the site in the event they are required.
- Identifying Key Incident/Emergency Response Personnel, Communications Links, Roles and Responsibilities, Emergency Support Services, Logistics coordination, Alert/Emergency Criteria. Current contact numbers must be continuously updated/maintained.
- Ensuring key communications links are established, communicated, maintained and tested via drills on a frequent basis.
- Developing procedures which provide clear instructions to Emergency Response Team with a focus of minimizing and/or containing damage and risk to others.
- Ensuring external agencies such as the RCMP, RNC are contacted as and when appropriate and stipulated in the incident/emergency management procedures.
- Business Recovery measures are identified and implemented after the incident/emergency is stabilized and under control.
- Fully investigate all emergency response incidents (and other incidents as appropriate) to identify lessons learned and communicate these to affected personnel.

1.0 Purpose

The purpose of this document is to outline the overall Health and Safety Management Plan for the management of Occupational Health and Safety on the Project. This *LCP* Health and Safety Management Plan defines the LCP expectations for health and safety planning and performance and describes how the Project will establish the Health and Safety Management System and implement the associated initiatives. It serves to provide the guidance, framework, and details of how the Safety Credo will be embedded with the LCP.

This Health and Safety Management Plan has been developed in full alignment with the Safety and Health Management System and all applicable Nalcor Energy Resources safety and health policies. The Safety and Health Management System and applicable processes and procedures will be utilized throughout the Project. In the event that any contract/subcontract company or functional group has control mechanisms, safety work practices than are identified in the plan, the more rigorous of the two will be implemented.

This Health and Safety Management Plan will help ensure that work conducted at all stages of the LCP complies with the intentions of the overall Health and Safety Management System, Health and Safety Policy and the Safety Credo.

The Project Delivery Team must fully understand and effectively apply the LCP Health and Safety Management Plan, as well as supporting documents, policies, programs and procedures, to all phases of design, construction, commissioning and full power. The ultimate objective to ensure that all risks are minimized to as low and reasonably practicable (ALARP) and a relentless pursuit of an incident free working environment is maintained at all times.

The LCP Health and Safety Management Plan must be utilized effectively by all Lower Churchill Project Delivery Team Members. Contractors and subcontractors must have Health and Safety Plans that align with this plan. For the Strait of Belle Isle Crossing (SOBI), the Contractor executing the work will bridge to this Health and Safety Plan via coordination mechanisms.

2.0 Scope

The Project Delivery Team provides the overall project management for the planning and execution of the LCP, will fully utilize this Health and Safety Management Plan. It is intended that this Health and Safety Management Plan be applied to all parties associated with the LCP, including Nalcor Energy LCP Employees, Contractors, Suppliers, and Consultants. It is a key functional component of the overall LCP Project Management System. Nalcor Energy LCP will require each of its contractors to have an effective and functional health, safety and environment management system in place which is reviewed during the contract bidding evaluation phases of all planned and executed contract activity. Consistency of the contractor Health and Safety Management System with the Nalcor Energy LCP Health and Safety Plan shall be addressed through a bridging document. Periodic due diligence audits will be conducted by Nalcor Energy LCP Health and Safety personnel to ensure all objectives, programs and practices monitored are maintained and achieved.

The LCP Health and Safety Management Plan is applicable for all phases of the Lower Churchill Project, including Planning, Design (Preliminary and Detailed), Procurement, Construction, Over-site, Completion and Ready for Operations. This includes the following Sub-Projects of the LCP, Phase I:

- Muskrat Falls Generation
- Labrador-Island Transmission Link
- Labrador Transmission Assets

This Health and Safety Management Plan is intended to incorporate all applicable Nalcor Health and Safety Practices, Policies, Procedures and Programs as well as achieve compliance with applicable legislation and regulations, which includes the Newfoundland-Labrador OHS Act and Applicable Regulations. Variations in the standards must be communicated to all LCP Personnel, which includes all Contractors and Sub-contractors.. As such, this Plan will function as an overarching document and focal point standard by which the SLI Health and Safety documents and subcontractor documents must bridge and adhere to.

3.0 Definitions

Hazard
The potential to cause harm, including ill health and injury, damage to property plant, products or the environment, production losses or increased liabilities.

Integrated Management System (IMS)
A framework of “coordinated” and “controlled” functional management resources, processes, procedures and tools that organize and direct the LCP with regards to established “project success criteria”, as defined in the LCP Project Charter.

Project Delivery Team
The Project Delivery Team includes managers who functionally report up to the LCP Project Director.

Management System (functional)
This system identifies management resources, processes, procedures and tools necessary to facilitate the achievement of the accountabilities/responsibilities of a functional group. The LCP functional groups correspond to the various functional responsibilities such as Health and Safety, Environmental, Quality, Engineering, Commercial Services, Project Services, etc., as identified in the Project Charter.

4.0 Abbreviations and Acronyms

A/I	Accident/Incident
ALARP	As Low as Reasonable Practicable
ATV	All-Terrain Vehicle
CoF	Certificate of Fitness
CSA	Canadian Standards Association
DnV	Det Norske Veritas

FMEA	Failure Modes and Effects Analysis
FTA	Fault Tree Analysis
H&S	Health and Safety
HAZID	Hazard Identification Review
HAZOP	Hazard Operability Review
HSE	Health, Safety and Environment
ER	Emergency Response
ISO	International Organization for Standardization
PDT	Project Delivery Team
JOHS	Joint Occupational Health and Safety
LCP	Lower Churchill Project
LITL	Labrador Island Transmission Link
LMS	Learning Management System
LTA	Labrador Transmission Assets
MF	Muskrat Falls
MOC	Management of Change
MSDS	Material Safety Data Sheet
NE	Nalcor Energy
OHSAS	Occupational Health and Safety Assessment Standard
PMT	Project Management Team
PPE	Personal Protective Equipment
PTW	Permit to Work
QRA	Quantitative Risk Assessment
RCMP	Royal Canadian Mounted Police
RFO	Ready for Operations
RNC	Royal Newfoundland Constabulary
SCAT	System Causation Analysis Technique
SLI	SNC Lavalin, Inc
SOBI	Strait of Belle Isle
SWOP	Safe Workplace Observation Program
TDG	Transportation of Dangerous Goods
TBRA	Task Based Risk Assessment
TLV	Threshold Limit Value
TSA	Task Safety Analysis
WHMIS	Workplace Hazardous Material Information Sheet

5.0 Managing Health and Safety on the Lower Churchill Project

Nalcor bears ultimate responsibility for Health and Safety Management and performance within the Lower Churchill Project. In terms of practical implementation of Health and Safety arrangements described in this Plan, the LCP Vice President expects his Management Team to take the lead in ensuring that all applicable arrangements are implemented within their areas of authority.

Nalcor Energy's Safety and Health Internal Responsibility System (IRS) is the cornerstone on which the Safety and Health Program is based. It is also a set of legal obligations for managing occupational health and safety. The defining principle of the IRS is that everybody within the organization from members of the Board of Directors to a temporary front line employee has a role and responsibility for safety and health. A second, and equally important, principle is that solutions to safety and health issues in the workplace come from employees themselves i.e. internal to the organization. While it is recognized that external assistance may sometimes be required, e.g. OH&S Branch of Government, it should be the exception rather than the rule.

An IRS works when:

- There is an unbroken chain of responsibility for safety and health flowing down through the organization and accountability for fulfilling safety and health obligations flows upward through the organization;

- Each employee takes the initiative on safety and health issues and works to solve problems and make improvements on an ongoing basis; and

- Depending on their position within the organization, their qualifications and authority, each employee accepts responsibility and accountability for their defined role.

Figure 1.0: Nalcor's IRS

The Health and Safety function exists to provide the necessary support, advice and guidance to assist personnel discharge their health and safety obligations. The Health and Safety function also audits the Lower Churchill Project systems and activities to provide assurance that our Health and Safety implementation is compliant with applicable legislation or other relevant standards and improvement opportunities are identified and acted upon.

This Plan is built on the following Nalcor Energy commitments:

- The Nalcor Energy "Safety Credo" (Section 7)
- The Nalcor Energy "Guiding Principles" (Section 7)
- The Nalcor Energy "Core Elements" (Section 7)

The following chart represents the overall hierarchy for Lower Churchill Project Health and Safety Management Documents, Plans, Policies and Procedures.

5.1 Health and Safety Management Interface

For MF, LTA and LITL, LCP Site Personnel will interface via daily, weekly and monthly meetings and stewardship sessions with the Project Delivery Team to ensure that:

- Safety and health goals and objectives and scope are fully understood and discussed by all management positions responsible for safety and health.
- The Project Delivery Team and all LCP personnel must clearly understand their roles and responsibilities for all project activities.
- All Management personnel on the project must clearly understand the processes and procedures linked to their areas of responsibilities.
- Joint construction and facility inspections must be conducted in an atmosphere of mutual cooperation to promote visible participation and endorsement of safety and health plan objectives whenever possible.
- The interface process must be reviewed on a periodic basis; continuous improvement plans are formatted and implemented as and when required.

For the Strait of Belle Isle (SOBI) Marine Crossing, the Contractor(s) executing the work will interface via daily, weekly and monthly meetings and stewardship sessions as warranted with the Project Delivery Team. The objectives of these interface sessions are as follows:

- Safety and health goals and objectives, as well as work scope are fully understood and discussed by all management positions for safety and health.

- The Contractor(s) management personnel must clearly understand their roles and responsibilities for all project activities, as well as the processes/procedures linked to their areas of responsibilities.
- Site inspections must be conducted periodically in an atmosphere of mutual cooperation to promote visible participation and an endorsement of safety and health plan objectives whenever possible.
- Plans for continuous improvement must be developed, implemented and progress tracked periodically.

Upon completion of principal Construction, The critical phases of commissioning and RFO (Ready for Operations) will require that additional Health and Safety Roles and Responsibilities must be carried out to ensure safe transition from Construction to Operations. These include, but are not limited to, the following:

- Health and Safety Management Plan for RFO developed and communicated in advance of RFO Activities.
- Risk Assessments/Task Analysis are executed during commissioning phases.
- Emergency Response Planning and Drills (Training and Establishing Roles and Responsibilities with Operations during Transition Period)
- Develop Health and Safety Procedure for Handover to Operations Personnel with roles and responsibilities clearly defined.
- Ensure appropriate Health and Safety Resources are in place to provide adequate oversight.
- Communications procedures must be developed, clearly defined and communicated to all affected parties.
- Ownership of process procedures must be clearly defined in a procedure
- Post Testing Debriefs must be carried out, fully documented and maintained on file.
- Health and Safety Equipment for RFO must be clearly defined, purchased and available on site in adequate timeframe to ensure coverage is 100% at minimum.

The following chart depicts how Health and Safety will interface with the Lower Churchill Project during three distinctive project phases engineering/ design/procurement; early works phase construction; and construction phase. Health and Safety Management Plans for the Lower Churchill Falls Operation will be developed, communicated and implemented prior to project handover/operations.

Health and Safety Focus Areas during Principle Construction Phases		
Engineering/ Design/ Procurement	**Early Works Phase Construction**	**Construction Phase**
• Health and Safety Planning Documents (Safety, Medical, Security, ERP)	• Early Works- Health and Safety Plan – Site Plans	• Construction Phase - Health and Safety Plan – Site Plan
• Constructability Reviews (per Component)	• Risk Assessments	• Logistics/Transportation Oversight
• Contract Evaluations/Input/ Procurement	• Task Safety Analysis (TSA's)	• Task Safety Analysis (TSA'S)
• Design Reviews	• Emergency Response Planning/Training/Drills	• Emergency Response Planning/Training/Drills.
• Risk Assessment Reviews- Confirm all Health and Safety Hazards/Risks are identified and mitigations are to be in place.	• Oversight Audits and Inspections (worksites, security, medical, regulatory compliance)	• Oversight Audits and Inspections
• Contract Work Scope Development	• Health and Safety Training (Energy Isolation –Lock-out/Tag-Out; Confined Space; Step Back)	• Critical Lifts- Planning, Analysis, Execution
• Risk Register	• Health and Safety Kick-off Meetings and Orientations	• Document Management
• Training Plan	• Ensure all operations are meeting Nalcor LCP Standards	• Coaching
• Equipment Selection and Procurement	• Logistics/Transportation Oversight.	• Health and Safety Training (Confined Space, Energy Isolation, Step-Back)
• Establish High Level Health and Safety Performance Standards	• Establish High Level Health and Safety Performance Standards	• Establish High Level Health and Safety Performance Standards
• Define Vulnerabilities in Design, Construction, Procedures and Mitigations	• Track incident trends and implement mitigation measures.	• Track incident trends and implement mitigation measures.

5.2 Lower Churchill Project Requirements- Health and Safety Integration

Health and Safety has been identified as a cornerstone of the overall Lower Churchill Project Requirements. It must be fully integrated into all phases of the project. Nalcor has elected to adopt the OHSAS 18000 (an internationally recognized ISO formatted standard for Occupational Health and Safety) as its standard for health and safety policies, procedures and programs for the corporation and the Lower Churchill Project.

The OHSAS methodology and requirements require full integration of Health and Safety into in all stages and aspects of the Lower Churchill Project. The Newfoundland and Labrador Occupational Health and Safety Act and associated regulations must always be considered as one of the documents to be consulted in support of the integration.

Effective planning for health and safety is essential if the LCP is to be delivered on schedule, without cost overrun, and without experiencing incidents or damaging the health of site personnel. A focus on continuous review, oversight and improvement must be undertaken and maintained to ensure the flawless execution of this project. The following chart reflects how health and safety will be integrated into the Lower Churchill Project:

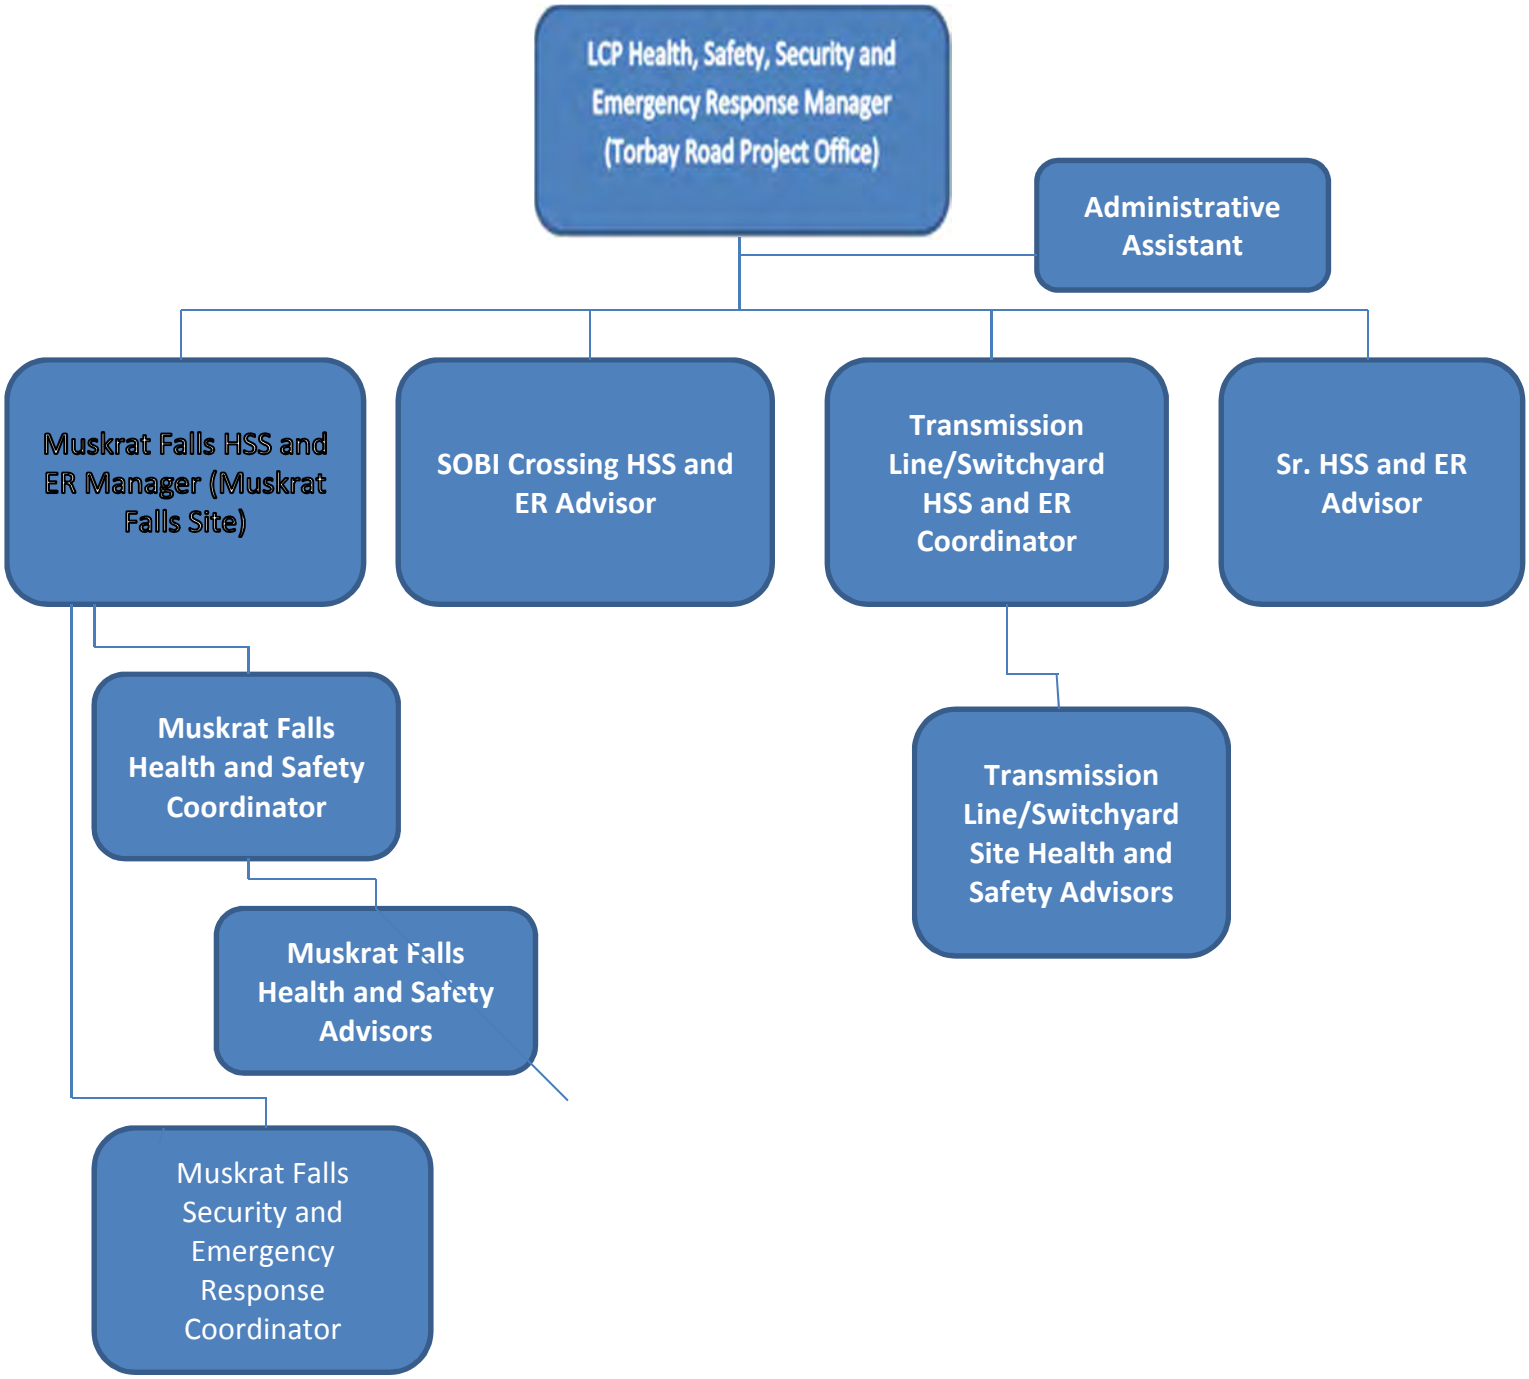
Figure 3.0: Integrating Health and Safety with Lower Churchill Project Requirements:

5.3 Health and Safety Organization – Lower Churchill Project

The Health and Safety Organization within the Lower Churchill Project will be provided with the appropriate level of support throughout the course of the project. The overall responsibility for safety performance on the project will be the responsibility of Nalcor Energy Corporation. However, Health and Safety support will engage the resources of all personnel to fully support through total buy in to the project standards, programs, policies and procedures.

As noted on the organizational chart on the next page, the Health and Safety Organization will include health and safety professionals from Nalcor, SLI and sub-contractors. The Health and Safety Organization is made up of the following support functions and organizations:

- The Project Delivery Team will have project oversight in terms of establishing governing corporate policies, procedures and programs. Corporate support includes oversight/auditing, policy and procedure development, safety and health initiatives and functional/directional support.
- The **Health, Safety, Security and Emergency Response Manager for the Lower Churchill Project,** located in St. Johns Torbay Road Office, will be providing functional support and expertise to the project as well as monitor and manage the overall health and safety direction of the Lower Churchill Project. Ensures consistency in direction, competencies, regulatory compliance, as well as implementation and application of Health and Safety policies, programs, procedures and strategies. The **LCP Senior HSS and ER Advisor** will report directly to the LCP HSS and ER Manager and provide technical HSS and ER Support for the LCP, as and when required.
- The **Muskrat Falls Health, Safety, Security and Emergency Response Manager** (located at the Muskrat Falls Site) will report directly the Muskrat Falls Site Manager with a functional reporting to the LCP HES, Safety, Security and Emergency Response Manager. **The Muskrat Falls Health and Safety Coordinator** will be responsible for monitoring, tracking and reporting day to day activities at the Muskrat Falls Site and will have **Health and Safety Advisors** reporting to this position. The Muskrat Falls Security and Emergency Response Manager will report to the Muskrat Falls HSS and ER Manager and providing support to Transmission Line/Switchyard Activities and Operations as well.
- The **SOBI Crossing HSS and ER Advisor** will report directly to the SOBI Crossing Project Manager with functional support from the LCP HSS and ER Manager.
- The **Transmission Line/Switchyard HSS and ER Coordinator** will report to Component #3 and #4 Site Managers with functional support from the LCP HSS and ER Manager. This position will also manage and direct activities of the **Transmission/Switchyard Health and Safety Advisors**, who will provide on-site Health and Safety Support.



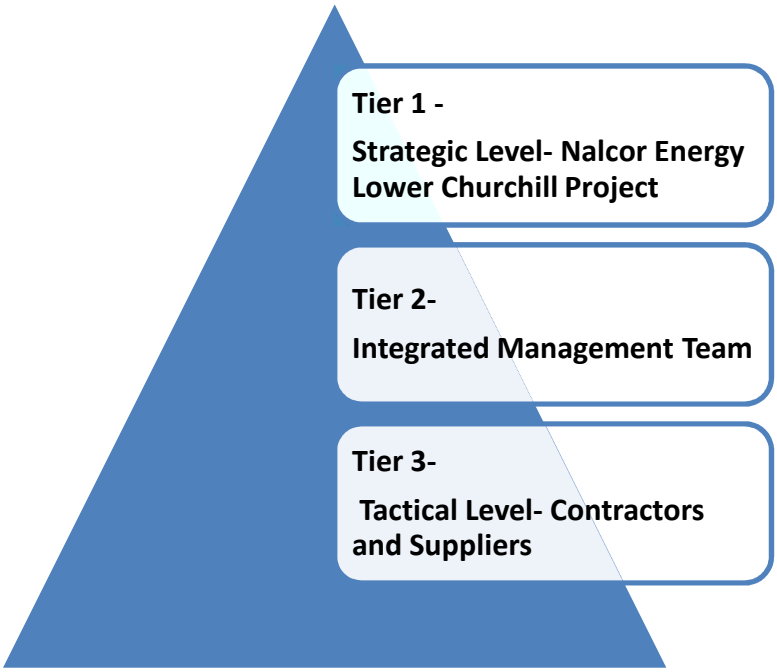
Lower Churchill Project
Health, Safety, Security and Emergency Response (HSS&ER)
Functional Organization Chart

6.0 Roles and Responsibilities:

This section denotes specific roles and responsibilities for key positions within the project team. If each individual filling these positions effectively executes these roles/responsibilities, the building of an effective health and safety culture will be assured.

The following chart (along with the explanation below it) identifies the three distinctive tiers with respect to how Occupational Health and Safety is typically managed in an Integrated Management Model and will be managed for the Lower Churchill Project. The Tiers identify the level of involvement for Nalcor Energy, the Project Delivery Team, as well as Contractors and suppliers- with each taking on a broader role. The chart also clearly defines roles and responsibilities within each tier level.

Figure 4.O: Occupational Health and Safety Management Roles and Relationships for Project Delivery Team Scope- Lower Churchill Project



Tier 1: Strategic Level

- Communicates and demonstrates Zero Harm- Nobody Gets Hurt Commitment.
- Establish LCP Safety Management System and Strategic Management Plan
- Establish expectations of Consultant's Health /Safety Plan through Coordination Procedures
- Review and Approve Health and Safety Plan and Site Plans

- Chair Project Level Health and Safety Steering Committee.
- Monitors Performance and coaches Consultants, Contractors and Suppliers to achieve desired outcomes.

Tier 2: Project Delivery Team

- Responsible for scope level management of work.
- Develops a LCP Health and Safety Management Plan based upon Nalcor's Health and Safety Management Plan
- Develops Site Specific Health and Safety Plan for all work sites.
- Establishes the necessary plan enablers (people, processes and tools)
- Selects subcontractors and suppliers who are able to execute their work scope safely.
- Demonstrates Zero Harm- Nobody gets hurt commitment.
- Reviews and approves sub-contractors Health and Safety Management Plans
- Charters and Chairs site Health and Safety steering committee.
- Monitors performance and coaches sub-contractors to achieve desired outcomes.

Tier 3 Tactical Level

- Develops a Project Health and Management Plan based on its company Health and Safety Management Plan
- Develops Site Specific Health and Safety Plan(s) for its work site
- Utilizes its people, processes, and tools to manage work-face safety.
- Focuses on Task Based Hazard Management and Work Competency
- Participates in Health and Safety Steering Committees
- Proactively engage the worker to promote a "Zero Harm- Nobody Gets Hurt" mindset.

6.1 Project Director

The Project Director is responsible for ensuring the Lower Churchill Project – Health and Safety Management Plan is fully implemented and effective, providing input on strategy development for each project deliverable, sanctioning the manpower and resources necessary for implementation of the LCP Health and Safety Management Plan and holding personnel accountable for its implementation and continued maintenance. The Project Director communicates and coordinates with Nalcor Corporate Staff, as well as Project Staff on a daily basis.

The Project Director's responsibilities from a Health and Safety perspective include (but are not limited to) the following:

- Clearly communicate health and safety expectations for the project.
- Demonstrate tangible commitment and involvement toward the relentless pursuit of safety performance excellence.
- Provide leadership for full implementation of safety and health policies, management systems and safety requirements to achieve health and safety objectives.
- Ensuring compliance with all applicable regulatory requirements is achieved and maintained.
- Be responsible for safety and health of personnel.
- Be a good role model for others to follow. Continually promote a high level of health and safety awareness.
- Periodically audit the health and safety programs effectiveness with the target for continuous improvement.
- Ensure all incidents are reported and investigated as required and corrective action taken to prevent recurrence.
- Ensure all core competencies and training needs are identified and training objectives outlined and achieved.
- Take all reasonable measures to prevent injuries to all personnel on the site (including visitors), who are exposed to hazards on the worksites under their control.
- Actively participate in safety plan activities
- Recognize significant safety achievements/accomplishments
- Reinforce health and safety as integral core values.
- Enhance workplace morale and attitudes

6.2 Project Managers

The Project Manager is responsible for ensuring the Lower Churchill Project – Health and Safety Management Plan is fully implemented and effective, providing input on strategy development for each project deliverable, sanctioning the manpower and resources necessary for implementation of the LCP-Health and Safety Management Plan and holding personnel accountable for its implementation and continued maintenance. The Project Manager communicates and coordinates with the Project Staff on a daily basis.

The Project Manager's responsibilities from a Health and Safety perspective include (but are not limited to) the following:

- Clearly communicate health and safety expectations to the respective Project Management Team.
- Provide effective leadership and guidance at the Project Management Level for full implementation of safety and health policies, management systems and safety requirements to achieve health and safety objectives.
- Demonstrate tangible commitment and involvement toward the relentless pursuit of safety performance excellence.
- Ensuring compliance with all applicable regulatory requirements is achieved and maintained during project planning, design, construction and overall execution of the project.
- Support and attend (where possible) the formal health and safety leadership training periodically.
- Be responsible for safety and health of all project personnel.
- Be an engaged role model for others to follow. Continually promote a high level of health and safety awareness.
- Assist the Project Director, as well as the Safety and Health Manager, to audit the health and safety programs effectiveness with the target for continuous improvement.
- Ensure all incidents are reported and investigated as required and corrective action(s) taken to prevent recurrence and communicated to others to prevent recurrence.
- Ensure all core competencies and training needs are identified and training objectives outlined and achieved within the Project Management Team.
- Take all reasonable measures to prevent injuries to all personnel on the site (including visitors), who are exposed to hazards on the worksites under their control.
- Actively participate in safety plan activities as well as periodic reviews.
- Recognize significant safety achievements/accomplishments
- Reinforce health and safety as integral core values.
- Enhance workplace morale and attitudes through effective communications, recognizing accomplishments and outstanding safety and health performance.

6.3 LCP Health, Safety, Security and Emergency Response Manager

The Nalcor Energy LCP Health and Safety Manager is responsible for ensuring the LCP-Health and Safety Management Plan is developed in conjunction with those developed by Nalcor Energy Corporate policies and best practices, regulatory guide lines, major contractors, and

communicated to the Project Director, as well as all Nalcor Energy LCP managers, supervisors and employees, contractors, subcontractors and consultants.

The LCP Health and Safety Manager's responsibilities include (but are not limited to) the following:

- Clearly communicate safety and health expectations for the project.
- Be responsible for promoting safety and health practices, policies and procedures for all personnel.
- Be responsible for establishing strong functional expertise in health and safety management, who are fully engaged in strategic-direction setting and day-to-day project delivery activities with Area/Scope Managers and Construction Managers.
- Provide technical expertise and guidance pertaining to safety and health related issues, conditions, incidents and actions.
- Take all reasonable measures to prevent injuries to all personnel on the site (including visitors), who are exposed to recognized hazards on the worksites under their control.
- Demonstrate tangible commitment and involvement toward the relentless pursuit of safety performance excellence.
- Coach Management and Supervisory Staff on effectively incorporating safety and health practices, policies and procedures as and when necessary
- Provide safety feedback to workers, supervisors, and managers
- Be a visible and effective role model for others to follow. Continually promote a high level of safety and health awareness.
- Actively participate in safety planning activities
- Coordinate formal Health and Safety leadership training for all levels of management and supervision.
- Recognize significant safety achievements/accomplishments in a timely manner
- Continually reinforce safety and health as integral core values.
- Enhance workplace morale and attitudes through effective interaction.
- Periodically audit the health and safety programs effectiveness with a target of continuous improvement and establish key performance indicators.
- Ensure all incidents are reported and investigated as required and corrective actions are taken to prevent recurrence. Communicate lessons learned from incidents and near misses to potentially affected personnel to better prevent recurrence.
- Ensure all core competencies and training needs are identified and training objectives achieved.

- Monitor effectiveness of hazard evaluation and reporting process.
- Actively participate in the audit/assessment process, providing guidance, support and professional expertise.

6.4 LCP Health and Safety Management Team

The LCP Health, Safety, Security and Emergency Response Management Team responsibilities from a Safety and Health perspective include (but are not limited to) the following:

- Ensuring that supervisors, leaders and employees comply with the requirements of the LCP-Health and Safety Management Plan to the extent applicable to their respective mandates.
- Attend and participate in formal Health and Safety Leadership Training targeted at all levels of management and supervision.
- Ensuring that health and safety programs comply with contractual and regulatory requirements.
- Reinforcing that workers are informed of site specific hazards and conditions and are adequately trained in safe work practices and procedures.

6.5 Supervisors, Leaders and Employees

Supervisors, Leaders and Employees are responsible for:

- Fully understanding the LCP-Health and Safety Management Plan and communicating the specific requirements applicable to their team members and contractors ensuring that deliverables are met within the stipulated timeframes.
- Line Management will be held accountable for the Safety and Health Performance of their subordinates and contractors.
- Communicating health and safety expectations to your subordinates and always being a good role model and example.
- Actively participate in Health and Safety Plan activities.
- Ensuring compliance with all corporate policies, procedures and practices included in this Management Plan and applicable regulatory requirements.
- Confirming that all workers are suitably trained and adequately qualified and have sufficient knowledge and experience to perform their work safely.
- Participation in hazard assessments carried out at the work sites.

- Promptly report high potential health and safety near-misses and incidents.
- Monitor the worksite and correct any unsafe conditions or unsafe worker behaviors promptly.
- Attend and participate in formal Health and Safety Leadership Training targeted at all levels of management and supervision.
- Ensure recognized hazards are eliminated to the extent practicable and ensuring any remaining identified hazards are adequately controlled/communicated to affected personnel. Identify and correct unsafe behaviors and conditions as soon as practicable.
- Always provide constructive feedback to subordinates.
- Continually assess leading and lagging performance indicators for trending to define and implement continuous improvement opportunities.
- Ensure appropriate personal protective equipment is readily available at the worksite, correctly used, stored and maintained and replaced when necessary.
- Be a safety resource and informal trainer/coach.
- Understand the capabilities and limitations of subordinates.
- Make every effort to enhance workforce morale and attitudes.

6.6 Project Delivery Team, Employees, Consultants and Staff

Project Delivery Team, Employees, Consultants and Staff are responsible for ensuring the LCP Health and Safety Management Plan is maintained and followed and identifying areas for continuous improvement to their respective managers and supervisors. Additionally, they are responsible for the following:

- Acquaint themselves with the recognized hazards that may exist in the activity they will be undertaking or the locations they will be working and the appropriate mitigating measures.
- Be a good role model to co-workers.
- Actively participate in Safety Plan Activities.
- Refuse to undertake unsafe work or utilize unsafe equipment believed to be unsafe.
- Perform all tasks with due regard to safety, as well as health and safety of co-workers, the public and the environment. Pre-plan safety as an integral core value.
- Participate in safety orientations, training sessions, programs and meetings and make positive suggestions to improve worker safety (utilize the SWOP program)
- Comply with all applicable safety policies, procedures, programs and regulatory requirements.
- Always use the required personal protective equipment and clothing.

- Report all safety, health and environmental incidents, as well as near-misses to your supervisor.
- Continually evaluate your own competency and make every effort to enhance your skills and capabilities.
- Know your co-worker's abilities and limitations, as applicable.
- Always use the appropriate safety and personal protective equipment required for the job.
- Report all unsafe conditions, imminent danger and potential hazards to your supervisor immediately.

6.7 Contractors and Sub-contractors

Contractors are responsible for familiarizing themselves with the LCP-Health and Safety Management Plan and workers are orientated to the safety plan to ensure that health, safety and environmental objectives are achieved and maintained. All Contractors and Sub-contractors providing a service or support to the LCP-Health and Safety Management Plan are required to work in accordance with the provisions of this Plan.

Additionally, they are responsible for the following:

- Acquaint themselves with the hazards that may exist in the activity they will be undertaking or the locations they will be working as well as appropriate mitigating measures.
- Refuse to undertake unsafe work or utilize unsafe equipment believed to be unsafe.
- Perform all tasks with due regard to safety, as well as health and safety of co-workers, the public and the environment.
- Participate in safety orientations, training sessions, programs and meetings and make positive suggestions to improve worker safety.
- Comply with all safety policies, procedures, programs and regulatory requirements.
- Always use the required personal protective equipment and clothing.
- Report all safety, health and environmental incidents, as well as near-misses to your supervisor.
- Report all unsafe conditions, imminent danger and potential hazards to your supervisor immediately.

NOTE: All personnel related to the project are responsible for their own safety, the safety of their fellow workers and for applying these LCP-Health and Safety Management Plan principles to their work task each day.

Utilizing a well-defined bid and selection process; Nalcor Energy-Lower Churchill Project Contractors are responsible for providing fully certified equipment onshore and offshore (where applicable) that meets its class designation including the equipment, crews, and Health and Safety management systems. The contractor also operates and maintains the right to the obligations defined in the Contractor's Health and Safety Policies and Procedures to ensure that health safety and environmental management is integrated into all of its business activities, all contractors will:

- Advise each manager, supervisor, employee and contractor of his/her Health and Safety Roles and responsibilities prior to job commencement;
- Comply fully with all applicable Health and Safety laws and regulations;
- Provide safe working rules, practices and procedures based on risk experience, safety knowledge and competent work direction;
- Assess all anticipated known risks prior to starting a new activity or one that is conducted very rarely;
- Ensure employees are qualified and trained to perform the tasks they are assigned;
- Make every effort to eliminate or minimize potential damage to equipment, vessel or environment;
- Investigate all incidents/accidents and take corrective action as appropriate;
- Ensure an immediate and effective response to emergencies is established and maintained and that all personnel understand their roles and responsibilities;
- Provide competent and trained professional staff to support Health and Safety activities;
- Monitor and report Health and Safety performance with a focus on continuous improvement; and
- Establish a strong Health, Safety and Environmental culture within all working groups/teams and contractor for The Lower Churchill Project.

Every employee of the main contractor has the responsibility to:

- Promptly report all hazards, incidents and near miss occurrences;
- Practice good "common sense" safety principles;
- Provide constructive ideas and concerns so as safety efforts and initiatives might be further strengthened;
- Become actively involved in the Health and Safety Program; and
- Comply with all federal, provincial and local regulations directly related to health, safety and environmental.

The above objectives will be accomplished by implementing the Health and Safety Plan in conjunction with the Lower Churchill Project and Contractor Health and Safety Policies and Procedures, as well as the Newfoundland and Labrador OHS Act and associated regulations. ***NOTE: In the event of a conflict within this plan and the contractor's plans, the most stringent requirement will always take precedence.***

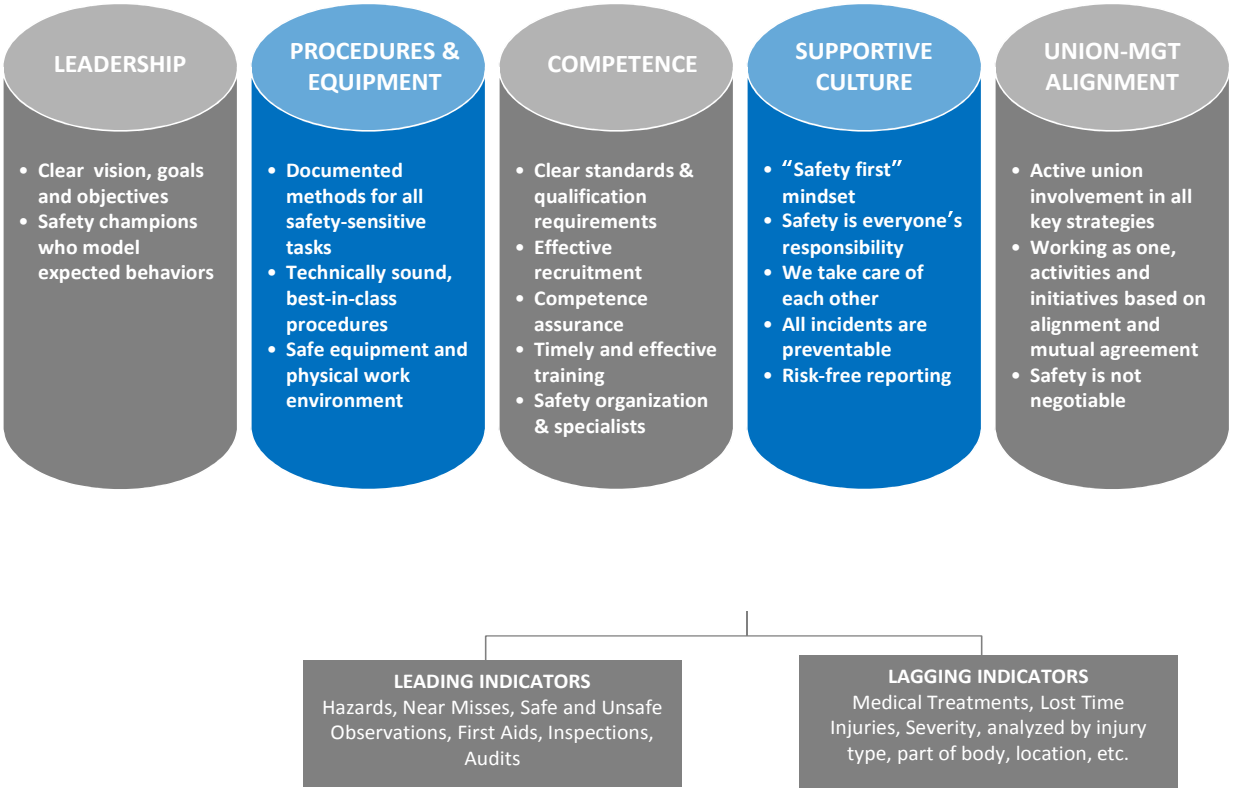
6.8 Accountability

All Personnel working on the Lower Churchill project are accountable for:

- Establishing and maintaining Occupational Health and Safety through continually safeguarding the well-being of project personnel, the general public, and the environment through safe and environmentally responsible work practices associated with the design, construction and transportation of the Nalcor Energy-Lower Churchill Project structures and equipment;
- Continually striving to maintain an accident and incident free "Zero Harm – Nobody Gets Hurt" working environment at Nalcor Energy-Lower Churchill Project and its contractors work sites and
- Ensuring total compliance with all Health and Safety applicable regulations.
- All Personnel involved in the Nalcor Energy-Lower Churchill Project are accountable for keeping to the following Safety Rules:
- Ensure Health and Safety always remain core values within all aspects of the project and are not prioritized along with other business priorities;
- Always follow established Safe Practices and Procedures – if they are not safe, advise your Supervisor and have them changed or modified;
- Always challenge and correct wherever possible any Unsafe Acts, Conditions or Procedures that you observer or otherwise come to your attention;
- Report all Safety Observations and Undesired/Near Miss Events and use your Safe Workplace Observation Program (SWOP) cards; (see it – fix it – report it)
- Only start on a task when you have all the authorizations and permits in place; and
- Always STOP/Intervene a task if you are not satisfied that it is safe to continue or it presents a risk to others.

7.0 Health and Safety Management System Framework

Figure 5.0: Health and Safety Management System Framework



The foundation of the Health and Safety Functional Management System Framework has been established and implemented based on the following:

- Safety Credo (Section 7.1- Figure 6.0))
- Health and Safety Policy, (Sections 7.2 and 7.3)
- Guiding Principles and Performance Objectives, (Section 7.4)
- Occupational Health and Safety Management Plan (A Management Plan that describes in detail of how the specific guiding principles and objectives will be achieved using specific enablers.),
- Enablers (People, Practices, Procedures and Tools that enable the implementation of the Plan.),
- Roles and Responsibilities (Section 8)
- Individual Behaviors and Actions. (Engaging personnel to act in a manner so as to minimize risk to the individual, the environment and stakeholders.).

7.1 Safety Credo

Our approach to managing safety on the Lower Churchill Project is rooted within the Safety Credo. Every member of the Lower Churchill Project is expected to work in accordance to the Safety Credo (Section 9.0) and to utilize the available tools and procedures that are required to complete their job safely.

The safety of our employees, contractors, visitors and the public is our first and most important priority. Our goal is a workplace where nobody gets hurt -- zero harm -- and a working environment where each and every employee is always concerned for their own safety and the safety of others. Everyone on the Lower Churchill Project is personally committed to these basic safety values as the foundation for our success as a safety leader.

The Safety Credo has three (3) basic rules to live by:

- I always follow safety requirements and best practices
- I always take time to complete my work safely
- I always take action when I see unsafe acts or conditions

Figure 6.0: Safety Credo

7.2 Health and Safety Policy

A written general policy statement can effectively reflect corporate management's positive attitudes and acceptance of overall responsibility for health, safety and environmental protection. It demonstrates to NE-LCP managers, supervisors, employees, contractors, subcontractors, consultants and visitors that the health and safety of workers and the preservation of the natural environment is a priority and takes precedence over expediency and shortcuts.

The LCP Health and Safety Policy reflects the Project Delivery Team's commitment to Health and Safety and forms the basis upon which the Health and Safety Management Plan, and as well as the LCP Health and Safety Management Plans of all Contractors, Suppliers, and Consultants working on the LCP is based.

This Policy and the goals embodied within it outline management's commitment to maintaining a safety culture within our organization, in the organizations of our contractors and subcontractors and in all project activities. It mandates the tangible demonstration of this commitment through compliance with the Health and Safety Policy and by making continual improvement an integral part of activities.

7.3 Nalcor Energy Corporate Occupational Health and Safety Policy

Nalcor Energy
Occupational Health and Safety Policy

The safety of our employees, contractors, visitors and the public is our first and most important priority. Our goal is a workplace where nobody gets hurt -- zero harm -- and a working environment where each and every employee is always concerned for their own safety and the safety of others. In support of this goal, Nalcor Energy and its employees are committed to the following guiding principles

1) Employees will govern their actions in accordance with Nalcor Energy's Internal Responsibility System for safety. This includes adherence to the principles of employee and role related responsibilities for their personal safety and the safety of their co-workers, contractors, visitors, and members of the public.

2) Nalcor Energy shall establish and maintain an Occupational Health & Safety Management System (HSMS) which:
   a. meets or exceeds legislated requirements and is compliance with accepted industry standards and practice; and
   b. documents health and safety objectives for Nalcor Energy; and
   c. contains a mechanism for performance measurement and continuous improvement; and
   d. facilitates both the formal and informal involvement of employees in the development, maintenance, and improvement of occupational health and safety within the organization.

President and CEO
Nalcor Energy

Rev: 02
June 8, 2009

7.4 Guiding Principles

The guiding principle upon which this Health and Safety Management Plan is built includes the following:

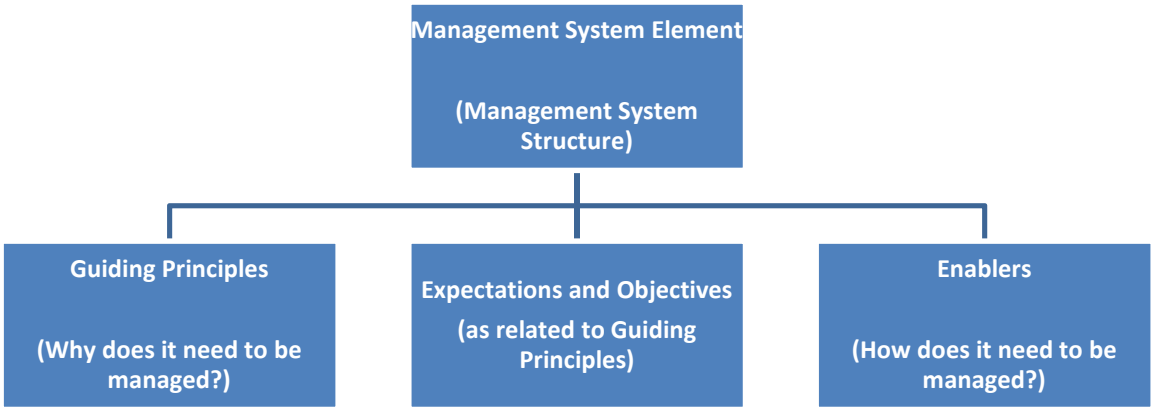
- All incidents are preventable.
- Ownership by senior management and on-site supervision is mandatory through direct involvement, a review of Health and Safety programs and efforts, and a focus on continuous improvement. Management must lead by example.
- Ensure appropriate resources and personnel are provided and available to execute the work safely and without adverse impact to health.
- Safety is a line organization function and cannot be delegated.
- As reasonable and practicable, Project Delivery Team has an obligation to eliminate or mitigate all known hazards and to ensure workers are fully competent and are supervised by a competent individual in the tasks to be performed.
- Management must understand and incorporate various safety practices and processes within the LCP and recognize when work activities, practices and procedures come in conflict with one another and instituting measures for mitigation.
- All Project Delivery Team personnel and contractor personnel associated with the work have the right to be aware of the hazards, the right to participate, and the obligation to stop unsafe work without retribution.
- All personnel associated with the work are empowered to contribute to the Health and safety efforts.
- Safety performance requires establishing procedures and programs, conducting training, contractor employee involvement, routine self-evaluation, and continuous improvement.
- Prospective contractors must clearly understand that past health and safety performance will be part of the criteria used to select contractors to perform work for the LCP.
- When necessary, a contractor is expected to improve or implement processes where gaps exist between their programs and the LCP's expectations.
- Continuous improvement must be a permanent objective for the LCP. Opportunities for improvement must be identified, evaluated and applied systematically and logically.

7.5 Health and Safety Management Plan Format

The LCP Health and Safety Management Plan is structured in accordance with the OHSAS 18001 Plan-Do-Check-Act Model for continuous improvement. It also incorporates the seven core elements of Health and Safety Management as noted below:

Figure 7.0: Seven Core Elements of Health and Safety Management

The Health and Safety Management Plan is structured to be both user-friendly and a useable resource. The basic format of the Plan includes a listing of sub-elements, guiding principles and enablers as defined below:



7.5.1 Element 1: Leadership (Commitment, Personal Behavior, Accountability):

The Project Delivery Team is responsible for supporting the development, implementation and assessment of safety and health initiatives and control mechanisms addressing emerging issues and providing feedback as and when appropriate. The Project Management Team must establish the overall tone of Health and Safety Management and its foundation of the project's overall culture.

Leadership Expectations: It is expected that all members of the Project Delivery Team will:

- Ensure that a positive Health and Safety Culture and Management System are established, implemented, communicated and supported at every level of the organization
- Communicate health and safety performance expectations to others.
- Visibly demonstrate their commitment to the achievement of the Project's Health and Safety goals and objectives.
- Be interested, visible and active in promoting Health and Safety processes and initiatives.
- Deal promptly and appropriately with Health and Safety improvement actions and suggestions within their area of control.
- Give appropriate consideration of Health and Safety performance as a key indicator of overall performance requiring equivalent management effort.
- Establish and maintain the standard for acceptable Health and Safety behaviors within the project by setting a model example themselves.

- Nominate Health and Safety Management Representative responsible for the overall coordination of the Management System and ensure the representative is trained in each of the Management Elements, expectations and roles responsibilities.
- Allocate appropriate resources to achieve our health and safety priorities and objectives.
- Where applicable, a clear Zero Tolerance policy is communicated to all employees (Examples include Drug and Alcohol Policy, Workplace Violence/Horseplay, etc.)
- A clearly defined disciplinary program must be communicated to all employees and applied fairly and uniformly.
- A clearly defined substance abuse prevention policy is posted and included in orientation literature
- Business Code of Conduct is posted and in place

Demonstrating Health and Safety Leadership: The Project Management Team can demonstrate Health and Safety Leadership by the following:

- Carry out site visits with the principle objective to review, discuss or promote Health and Safety issues.
- Establish, Manage and Track Project and Individual Health and Safety performance toward established goals and objectives. Promote overall Health and Safety Performance Awareness.
- Make health and safety a key agenda item at Management Meetings.
- Taking a proactive approach to the prevention of incidents as an integral part of our operations overall.
- Become actively involved in Health and Safety Coordination and Steering Committee (JOHS).
- Strive to achieve all aspects of personal health and safety performance contract.
- Include health and safety roles, responsibilities and accountabilities in manager's job descriptions.
- Include health and safety performance as an integral part of the performance appraisal process.
- Include the nominated health and safety Management Representatives on the organization chart.
- Ensure effective health and safety Orientation Programs are in place covering Safety Standards, Policies, Procedures and Core Values.
- Enable Supervisor health and safety Responsibility to be provided periodically.
- Provide Behavior based health and safety Training Programs periodically.
- Ensure Behavioral observations are performed.

- Encourage health and safety Surveys be performed, analyzed and used to establish corrective actions, as appropriate.

Taking Personal Responsibility: The Project Delivery Team, as well as personnel at all levels, must take personal responsibility for Occupational Safety and Health. To accomplish this, all personnel should exhibit the following:

- Sincere caring for others, their safety and their well-being.
- Be aware of their influence as a role model at work and during their spare time.
- Sound health and safety behavior on and off the job.
- Intervene constructively with at-risk behaviors and conditions
- Are attentive to others behavioral changes, and respond appropriately
- Follow defined Health and Safety policies, procedures, rules and standards.

Understanding Accountabilities: Everyone associated with the Lower Churchill Project, its operations and activities is accountable for their actions. Deviations from standards of acceptable behavior are dealt with in a fair and consistent manner. Personnel at all levels of the organization must:

- Understand what is expected and are held accountable for their actions and inactions.
- Use their authority and responsibility to react to all observed or known at risk behaviors or unsafe conditions.
- Respond in an open and fair manner to incidents reported and issues raised.
- Practice tolerance for mistakes but are aware of and accept consequences for reckless behaviors.
- Must be open and receptive to constructive feedback from others.

7.5.2 Element 2: Communications (processes, information and documentation)

Effective and open communications are essential to the success of any project. Successful internal communication is crucial to the development of an informed and motivated workforce. Efficient external communications preserves Nalcor's reputation and enhances our business standing and credibility.

Communications Expectations: For effective communications, arrangements must be made which ensure that Managers can:

- Identify, develop and maintain systems for the control of information necessary for working safely and assure regulatory compliance with health and safety issues.

- Ensure that personnel are properly informed of health and safety risks and control measures.
- Encourage employees at all levels to raise health and safety concerns without reprimand and shall respond to these concerns in a timely and appropriate manner.
- Fully support consultation on health and safety matters to explore opportunities for influencing issues.
- Ensure health and safety campaigns and initiatives receive adequate publicity.
- Support health and safety representatives and committees to contribute to the Project's health and safety performance.
- Establish an effective channel between management, employees, third parties and clients concerning existing, new or evolving health and safety issues.
- Encourage Personnel at all levels to give feedback, propose improvements, share information and best practice.
- Support proper liaison with clients, contractors, sub-contractors and external bodies on health and safety issues occurs.
- Ensure that the LCP is represented on industry bodies and positioned to influence and shape Health and Safety policy and regulatory matters.
- Health and Safety achievements are given due publicity and recognition.

Establishing Effective Health and Safety Communications: Effective communications can be achieved through effective training, interaction, forums, policies, programs and health and safety meetings. The following Health and Safety Communication tools have been put in place to enable effective communications:

- Periodic health and safety meetings/daily toolbox talks carried out at the worksite.
- Health and Safety Representatives committee meetings (JOHS Committee)
- New Employee Orientation Sessions
- Periodic Project newsletters
- Health and Safety bulletins and alerts (Communicating Lessons Learned)
- Industry forum representation and participation
- Management site visits with focus on Health and Safety
- Meetings with clients, contractors/subcontractors on health and safety issues.
- Emphasize and promote health and safety publicity campaigns
- Effective communication channels are in place without filtering mechanisms
- Forward communications which outline changes to health and safety practices, policies and procedures

- Training programs reviews carried out periodically to ensure current technology, applicable risks and regulatory requirements are addressed
- Employees suggestion program
- Encourage use of a Safety slogan/theme program
- Participate and support Safe Work Observation Program (SWOP)
- Track leading and lagging indicators

Expectations concerning Information and Documentation Management: The availability of accurate, relevant and current information and documentation is a key contributor to successful health and safety performance. Processes for capturing and sharing knowledge are in place to deliver the best available health and safety practice to our operations. Effective information and documentation management systems are in place such that:

- Drawings and other pertinent documentation necessary for health and safety compliant operations are identified, current and readily accessible.
- All applicable regulations, codes and standards are identified, current and readily accessible.
- Document retention and archiving requirements are established and satisfied.
- The currency of the system and procedures is ensured.
- Roles and responsibilities in relation to information and documentation management are clearly understood.
- Appropriate use is made of electronic information management systems.

Effective Information and Documentation Management Mechanisms: The following mechanisms and management systems can be utilized to effectively store, research, retrieve and retain Project Information and Documentation:

- Integrated Management System
- Document management system
- Health and Safety plans and interface documents
- Health and Safety library and databases
- Internet
- Communicating Health and Safety Regulatory Changes and Interpretations
- Document Retention Procedures/Programs.
- Document Disaster Recovery Procedures

- Periodic Assessment/Audits of Informational Systems for Effectiveness, Compliance with Policies and Procedures.
- Regulatory Compliance Plan in place.
- Lessons learned capture and implementation process.

7.5.3 Element 3: Organization (competence, personal development, roles/ responsibilities):

The success of Health, Safety and business performance within the Lower Churchill Project is largely influenced by the competency of employees, contractors and sub-contractors. While the maintenance of a stable, competent and motivated workforce is also a critical factor. In order to ensure competency and personal development, Managers will assure that:

- Effective recruitment, selection and placement processes are in place and fully functional.
- Health and Safety competence requirements are identified, gaps analyzed and training programs are in place to close the gaps.
- A health and safety mindset and competence requirements are applied in recruiting, selection, succession planning and promotion at all levels.
- Personal appraisal/performance and development reviews are undertaken for employees.
- LCP employees are encouraged and supported in their career development.
- To the extent practicable, succession planning is in place.
- Ensure that a comprehensive training program is in place for all individuals to ensure the correct level of competence and health and safety awareness is attained prior to any change in their job duties.
- Health and safety training is provided by competent personnel and its effectiveness is properly reviewed.

Means to Accomplish Workforce Competency and Personnel Development: Occupational Health and Safety must be included as a part of overall:

- Recruitment, selection and placement procedures.
- Resource forecasting and allocation.
- Project site inductions.
- Position/role descriptions including competency requirements.
- Succession planning.
- Competency Assurance Systems/Testing and Verification.
- Personal appraisal and development programs, including a review of overall health and safety performance

- Training need analysis
- Training matrices / plans
- Program effectiveness evaluation including review of assigned tasks and targets with respect to health and safety roles.
- Competence training in health and safety policies and procedures, hazards awareness and required certifications

Understanding Roles and Responsibilities within the Organization: The defining and understanding of individual roles and responsibilities are key to the achievement of our project health and safety objectives. It is very important that the appropriate level of resources is allocated and responsibilities are clearly defined and communicated. To do so, arrangements must be in place to ensure that:

- Health and Safety roles and responsibilities are a clearly defined and integrated part of all job task roles, and are clearly communicated and understood.
- Appropriate resources are allocated to enable Project Delivery Team to reach its Health and Safety objectives.
- Appropriate health and safety resources are allocated in relation to project execution.
- A health and safety function is in place to support the organization, is identified on organization charts, and reports at the highest appropriate level within the organization.
- Health and Safety committees and representatives are appointed, their roles are defined and they are involved in health and safety processes at all levels

Policies, Procedures and Programs for Assuring Competency/Personal Development: The following policies, procedures and programs are in place within the Lower Churchill Project to assure competency and personal development:

- Recruitment, selection and placement procedures.
- Resource forecasting and allocations.
- Position descriptions which include clearly defined health and safety competency requirements.
- Orientation/ Induction training program focusing on these expectations given to all employees
- People surveys and interviews.
- Site health and safety procedures.

- Health and Safety resources included in budgets.
- Health and Safety function identified on organization chart and participates in business management meetings as appropriate.

7.5.4 Element 4: Management of Risk/Emergency Preparedness/Health (risk assessment, emergency preparedness, occupational health, MOC)

The Lower Churchill Project must ensure that Occupational Health and Safety Risks arising from, or associated with its activities are identified, addressed and effectively managed, so as to eliminate or reduce them to a level that is as low as reasonably practicable (ALARP). An effective means of risk management must be in place and fully functional and ensure the following:

- Health and Safety risks are identified and their consequences and probabilities properly assessed to ensure that risks, so far as reasonably practicable, are assessed based on probability of occurrence, risk, severity, consequences to personnel and the environment and are controlled utilizing the following hierarchy (preferred actions to least desirable actions): a) Risk Elimination, b) Engineering Design to Mitigate Risk, c) Incorporate Safety Devices for Risks that cannot be mitigated, d) Provide Warning Devices or e) Personal Protective Equipment.
- Appropriate risk reduction or mitigation measures are identified and implemented and managed to completion.
- Risk assessments are facilitated and undertaken by competent personnel including, where necessary, expertise external to the Project.
- Risk assessments are subjected to an appropriate review and validation process.
- Risk assessments are properly documented and action items closed in a timely manner.
- Affected personnel are made aware of, and understand risk assessment results and recommendations relating to their activity.

Enabling Measures to the Risk Assessment/Mitigation Process: The following processes can assist with the execution of an effective risk assessment/mitigation task:

- Risk Policy is in-place and supporting risk management program which includes the assessment of Health and Safety related risks.
- Ensure identified risks are addressed at the appropriate level within the project organization, given the nature and magnitude of the risk.

- Ensure adequate risk control equipment/practices are included as part of design, construction and operations.
- Risk register and risk mitigation / control plan are in-place and updated periodically.
- Risk mitigation /control measures are effectively communicated to all affected personnel.
- Throughout the project execution phases perform various health and safety specific risk assessment / management activities.
- Conduct risk/hazard assessments, including the following techniques: HAZID (Hazard Identification), HAZOP (Hazards Operability Analysis), QRA (Quantitative Risk Assessment), FTA (Fault Tree Analysis), FMEA (Failure Modes and Effects Analysis).
- Conduct constructability assessments with due consideration of Health and Safety Factors/Issues.
- Conduct Task Based Risk Assessments (TBRA- Refer to Section 13.1))
- Implement Step Back 5 x 5 (Utilizing the 5x5 Risk Matrix to evaluate a particular work tasks)
- Implement WHMIS
- Conduct Manual and Equipment handling risk assessments (Refer to Section 13.1)
- Conduct ergonomic assessments
- Conduct fire risk assessments
- Implement hazard recognition and reduction methods included in training

Changes in operations, organization, facilities, systems and procedures must be properly evaluated and managed in such a way as to minimize any potentially adverse Health and Safety impacts. Best Practices should be captured during the transitional phase. For changes of this nature, the following measures must be in place to allow for proper assessment and control:

- Organization, staffing, roles and responsibilities for change management
- Management systems, processes and procedures
- Facilities, plant, process and equipment
- Work scope/tasks include change management documentation requirements.
- Regulations, procedures and standards
- Changes are appropriately documented, reviewed, approved, communicated and authorized prior to execution
- Change implemented is periodically monitored and reviewed and any action items resulting from the review are addressed in a timely manner prior to change closure

Enabling measures for Managing Risk as a result of Changes to Organization, Facilities, Systems and Procedures:

- Management of change process
- Personnel transfer/promotion processes
- Change control processes and procedures
- Levels of authority for change approval
- Monitoring, audit and review processes
- Change item action tracking
- Document/Communicate Changes
- Review/Approval Process
- Work scope changes
- Matrix of compliance related to authority rules and regulations.
- Monitoring, audits and review process
- Revision controlled technical documents

Emergency Preparedness is essential in order to protect personnel, the environment and assets. Emergency Response Plans are in place to allow us to respond effectively and efficiently in the event of an actual emergency. In order to effectively respond to an emergency, the following systems, plans, procedures and training must be in place:

- Emergency response plans are based on an assessment of potential incidents and threats, and are documented and well understood by all affected parties
- Emergency response management plans/programs must reflect the uniqueness/specifics of the work and associated work locations.
- Personnel with emergency response roles and responsibilities are fully trained and competent
- Appropriate emergency response facilities and equipment are provided and maintained in fully operable condition.
- Personnel security is assessed and included in emergency response plans.
- Interface arrangements with contractors, subcontractors and the community include well defined emergency response responsibilities.
- External communication roles concerning emergency responses are documented and understood by all parties.
- Emergency response drills and exercises are undertaken regularly.
- The competency of those involved in ER is assessed on an ongoing basis.

Emergency Response Plan Effectiveness/Efficiency: To best ensure the effectiveness and efficiency of the Emergency Response Plan, the following will be implemented at the Project Office and/or Field Construction Sites:

- Coordination procedures and documents clearly defining Emergency Response roles and responsibilities with contractor interface.
- Emergency Response procedures and plans have been established and organization will be fully trained
- New employee / visitor orientation includes Emergency Response overview and discussion of specific roles and responsibilities.
- Periodic Emergency Response drills and exercises will be carried out with the target of continuous improvement.
- Emergency Response training conducted including hands-on and simulated exercises, as appropriate.
- Duty rosters established and maintained current insuring that all key positions will be fully manned.
- Emergency Response facilities on site established and maintained in fully operable condition (e.g. first aid equipment, firefighting equipment, and emergency phone numbers posted at conspicuous locations).
- Evacuation plans prepared and in place and known to appropriate personnel.
- Equipment inspection records established and maintained current.
- Media interface training for emergency situations.

Occupational Health: The Lower Churchill Project will actively monitor its activities to ensure that appropriate measures and programs are in place to protect our employees from harm as a result of occupational health hazards. To accomplish this, Managers will ensure that:

- Prevent occupational illness or injury to the Project Team and field workforce by managing medical, public health and occupational health risks.
- Minimize the seriousness of injuries and illnesses by ensuring access to quality primary and emergency medical care.
- Ensure that well planned, well documented and drilled procedures are in place for responding to remote medical incidents requiring significant medical attention and/or evacuation.
- Verify that all National, Provincial and Local Health Regulations are incorporated in Project plans and facility designs.

- Ensure satisfactory health management of Project sites through Health inspections and surveillance.
- All employees are encouraged to raise occupational health issues and concerns as they arise.
- Establish expectations that construction and installation contractors implement procedures and programs for ensuring healthy working conditions for personnel during the course of the project.
- Ensure communication of known health related hazards and remedial measures to all affected personnel.
- Ensure that project activities do not inadvertently affect the health of project personnel or local communities.
- Appropriate corrective/ preventative measures are implemented in a timely manner.
- Follow-up actions are taken to ensure appropriate provisions are adopted and fully implemented.
- Identify and implement regulatory and best practice medical practices, procedures and programs.

Implementing Health Measures and Programs: Methods for Implementing Measures and Programs designed to protect all personnel from harm as a result of Occupational Health Hazards include the following:

- Employee Health Questionnaires
- Food Services Contractor Health Plans must be prepared and periodically reviewed/updated which include organization charts, medical emergency response, worker immunizations/medical evaluations, known health risks, training requirements and health inspections, food handling, preparation and storage requirements.
- Ensure all personnel are fully trained and prepared for working conditions in Newfoundland and Labrador.
- Applicable periodic physicals
- Health communications through bulletins, e-mails, programs, training and procedures.
- Follow-up medical examinations, as identified and applicable.
- Medical evaluations for known and specified regulated activities
- Health Risk Assessments
- Worksite Health Assessments
- Worksite Health Inspections
- Health Awareness Training

- Health Related Awareness Bulletins
- Budget for medical and health assessments related to remote project locations, during planning phase.

7.5.5 Element 5: Third Party Relations (Clients/Partners, Contractors/Suppliers, Community)

Establishing and Maintaining Effective Client/Partner Relationships: Effective Client and Partner interfaces and working relationships are critical for the Lower Churchill Project and for our common Health and Safety Performance. We work closely with clients and partners to manage our roles and align expectations and goals. Arrangements must be in place to ensure that:

- Health and Safety expectations, objectives, responsibilities, roles and interfaces are clearly defined, documented and agreed between the involved parties.
- An open dialogue on Health and Safety issues is retained at appropriate levels within the organization.

Client/Partner Interface Processes: Processes that enable more effective Client/Partner Interfaces include the following:

- Health and Safety meetings (or segments of meetings)
- Bridging documentations
- Audit plans
- Reporting processes
- Role and responsibility definitions.

Third Party Contractors and Suppliers: The risk presented by third parties (contractors/sub-contractors and suppliers) can have a significant impact on the Project's health and safety performance and reputation. Such risks need to be properly managed to minimize potentially adverse effects. Third party health and safety performance is reflected in the overall LCP performance. To maximize Health and Safety Performance, the following must be considered and implemented:

- Third parties are selected based in part on consideration of their Health and Safety performance, planning, programs, policies and procedures.

- Health and Safety programs and overall compatibility with the Project's Management Systems.
- Third parties Health and Safety standards must be broadly similar to those of the Project and are appropriate to the risk criticality of the services and products provided.
- Suppliers and sub-contractors are involved at an early stage to allow risks to be identified and properly managed.
- The Project requirements with respect of Health and Safety Responsibilities and performance are defined and communicated to third parties.
- Third parties have clearly defined roles and responsibilities for their individual managers.
- Interfaces between the Project and third parties is clearly defined and effectively managed.
- Monitoring of third party performance includes Health and Safety and deficiencies are identified and corrected and preventative measures are put in place.
- Contractors/subcontractors and suppliers understand that consequence for poor Health and Safety performance, or lack of agreed improvements, can be up to and including stop work orders and in extreme cases termination of work
- Lessons learned from third parties are captured and openly shared within the Project Delivery Team.

Effective Selection Processes: Processes that enable the effective selection of contractors and suppliers include the following:

- Selection strategy documentation for major and minor package suppliers
- Contractor pre-qualification and selection process
- Pre-bid Meeting reviewing Health and Safety Expectations with bidders
- Pre-contract award Health and Safety assessment
- Safety performance terms and conditions included in contacts
- Health and Safety Coordination Procedures contained in all contracts
- Health and Safety development program/improvement plan
- Regular meetings with all contractors
- Site visits to Contractor/Supplier Worksites
- Interface documentation review
- Performance monitoring plans and strategies
- Periodic Performance Audit and associated follow-up
- Contract and/or project close-out reports
- Contractor Health and Safety Plan prepared to address the specific scope of work

Relationships with Neighboring Communities: Keeping good community relations are crucial for our long term success. In the course of the Lower Churchill Project, we must be focused on being a good neighbor and seek to find opportunities to contribute to the well-being of communities in which we operate. Effective means of ensuring good relationships are maintained with Neighboring Communities include ensuring the following:

- Risks to the communities associated with the Lower Churchill Project are openly communicated to the appropriate parties in a timely manner.
- Our project contributes in a positive manner to the communities where we operate.
- We cooperate with authorities, non-government organizations and industry organizations on health and safety matters.

Maintaining Effective Relationships: Good relationships with the Neighboring Communities of the Lower Churchill Project worksites are very important to the overall success of the project. Effective means of maintaining Community relationships include the following:

- Emergency response plans (including the focus on the neighboring community)
- Open facility and family days with health and safety focus, as and when appropriate.
- Health and safety initiatives with local schools, and voluntary groups
- Stakeholder management plans that include consideration for health and safety issues through all phases of the project.

7.5.6 Element 6: Product Realization:
(Equipment and Materials)

Interfaces and relationships with clients and partners are critical for the Lower Churchill Project overall Health and Safety performance. The Project Delivery Team will work closely to manage our roles and align expectations and goals. To accomplish this, the following arrangements must be in place:

- Proper selection and specification of the facility, equipment and materials take place.
- Effective procurement processes and quality control systems are in place to minimize risk importation.
- Facility, equipment and materials provided are safe, compatible, of good quality and fit for their intended service and are renewable/recyclable (whenever possible).

- Fully compliant with equipment inspection, certification, quality assurance and maintenance requirements.
- Appropriate information, instruction and training on the safe use, handling storage and environmentally sound methods of disposal of plant, equipment and materials are made available to affected personnel.

Ensuring Project Facility, Equipment and Materials meet Project Expectations: Ever effort will be made to ensure that applicable standards, standard industry practices and regulatory requirements utilizing the following processes:

- Specification and procurement processes are in place and reviewed periodically.
- Operating, inspection and maintenance procedures including health and safety stipulations.
- WHMIS assessments/product data sheets.
- Certification plans are in place and reviewed periodically.
- Information, instruction and training are current, available and reviewed.

7.5.7 Element 7: Continuous Improvement (Incident Investigation and Analysis, Audits, Measurement Review and Improvement Initiatives):

A continuous improvement mechanism must be implemented to consistently evaluate the mechanisms and controls being utilized to achieve the key safety elements. The following are effective means of evaluating the key safety elements:

Audits and Assessments: Audits/assessments are often utilized as a prudent means to monitor compliance and help elevate continuous improvement. On the LCP, Project and Regulatory requirements will be audited periodically to ensure effective management. Audits, assessments, and performance review activities and systems are various means to assure compliance with both internally and externally imposed standards within the project. Arrangements for audits and assessments will include the following:

- Audit programs that specifically address Health and Safety practices, policies and procedures that are in place and ensure they are followed.
- Audit scopes and frequencies are risk based.
- Audits are conducted by competent persons.
- Findings and actions are agreed with auditors and well documented.
- Audit results are communicated to the appropriate level of management.

- Lessons learned are shared with appropriate parties.
- Audits will be carried out to regularly access compliance with the elements of the Health and Safety Management Plan.
- Periodically, access compliance with health and safety regulatory requirements will be evaluated.
- Audits may also be performed by personnel outside the project, having health and safety expertise and auditing expertise.
- Auditors are identified, notified and involved in the planning and process to the appropriate level.
- Findings are properly communicated to auditors and to an appropriate level of Project management, along with any trends noted.
- Findings resulting from an audit are assessed, documented, prioritized and monitored until satisfactorily resolved.
- Audit entitlement/expectation is agreed with clients and documented in contract and interface documents.
- Properly constituted management reviews will be undertaken periodically.
- Effective health and safety audit procedures are in place to evaluate compliance with work procedures, work rules and permits for critical tasks/activities

Audit Effectiveness: To ensure overall audit effectiveness, the following procedures, programs and follow-up must be in place:

- Documented Audit programs and defined schedules
- Auditing procedures and well defined protocols
- Auditor training program
- Timely Audit reports, Responsible Individuals Assigned Actions (as appropriate), Target Dates for Completion and Follow-up
- Internal and external audits are conducted
- Periodic Review of Audits, Audit Trending and Communicating Trends to Management.
- Interface documents
- Multi-faceted/disciplined teams to perform the audit.

Measurement and Review: Interfaces and relationships with clients and partners are critical for our overall health and safety performance. We will work closely with clients and partners to manage our roles and align expectations and goals. This will be further enhanced using the following:

- Leading and lagging health and safety indicators are measured, reviewed and used as input to generate improvement initiatives.
- Health and Safety feedback from all parties is used as input to improvement plans.
- Health and Safety driven management reviews are conducted periodically.
- Improvement plans include data from all available and applicable sources.
- Processes exist to manage health and safety improvement actions to completion.
- Health and Safety improvement plans are considered in the Project strategy process.

8.0 Contractor Management

For onshore and offshore (where applicable for the SOBI work) construction, exploration and development operations the work activities will be performed using contracted equipment and personnel. The competency and behavior of the contractors along with their integration into the operation as a whole can have a major impact on health, safety and environmental performance. Where applicable, LCP will ensure union management on health and safety are working cooperatively in the achievement of its vision. The Nalcor Energy-Lower Churchill Project will strive to engage reputable and fully qualified contractors who have demonstrated an ability to conduct their activities in a manner consistent with the Nalcor Energy Health and Safety core elements as outlined above. The Lower Churchill Project has established certain minimum requirements and expectations that will ensure contractors conduct their activities in a safe and environmentally sound manner. These requirements form the basis of the Nalcor Energy guidelines and are conveyed to prospective contractors during the bid process.

8.1 Contractor Selection Criteria

All contractors are formally evaluated on their health, safety and environmental performance prior to awarding of a contract. To assist Nalcor Energy LCP in evaluating the quality and effectiveness of contractors' health and safety management systems, each prospective contractor will complete and submit, in support of the bid proposal, Nalcor Energy LCP Bid Evaluation Questionnaire that provides an overview of the contractors Health and Safety management system in terms of the following:

- Health and Safety Policy and commitment
- Management Involvement and Leadership
- Hazard Assessment and Risk Control
- Appropriate Safe Practices, Procedures and Rules

- Training Program including Orientation and Competency
- Communications/Health and Safety Meetings
- Incident Reporting, Investigation Policy and Analysis
- Regulatory Requirements/Compliance Plan
- Personal Protective Equipment (PPE) Policy and Program
- Environmental
- Emergency Preparedness
- Accident Statistics and Records
- Modified Work Programs/ Early Return to Work
- Maintenance Policy and Programs
- Substance Abuse and Testing and Accommodation Programs
- Subcontractor Management and Control Programs.

8.2 Contractor Health and Safety Performance Measurement

Details and frequencies of any monitoring, audits and review of health and safety performance are contained in the Contractor's overall Performance Reporting Procedures and the contractor's management systems.

Health and Safety statistics are prepared on a monthly basis by the Health and Safety Coordinator and forwarded to the Project Delivery Team for review. Additionally, a monthly update will be provided to the project management team including the contractor's workforce to provide feedback on Health and Safety performance and facilitate opportunities for continuous improvement.

The Lower Churchill Project will ensure the timely follow-up and completion of corrective actions identified through field inspections, audits, incident investigation and safety meetings. It is the responsibility of the Senior Manager on a work site or marine vessel to ensure that all corrective actions are implemented and closed out in a timely basis. It is the responsibility of the Contractor Health and Safety Manager to ensure that actions items are traced for verification of close out. As and when necessary, the Project Delivery Team will coach and guide the contractor in the delivery of the Project in order to achieve its Vision.

9.0 Appendices:

Appendix "A"-Rights and Responsibilities of Employees

Appendix "B": Health and Safety Training

Appendix "C": Hazard Identification and Evaluation

Appendix "D": Changes/Modifications to Procedures/Equipment

Appendix "E": Work Standards, Practices and Procedures

Appendix "F": Personal Protective Equipment

Appendix "G": Working in Cold Environments

Appendix "H": WHMIS

Appendix "I": Transportation

Appendix "J": Work Site Hazards (Wildlife Management

Appendix "K": Workplace Security

Appendix "L": Nalcor Corporate Safety and Health Standards

Appendix "M": Electrical Safety

Appendix "N": Nalcor Corporate Safety and Health Programs

Section 9.0 – Appendix "A"

Rights and Responsibilities of Employees

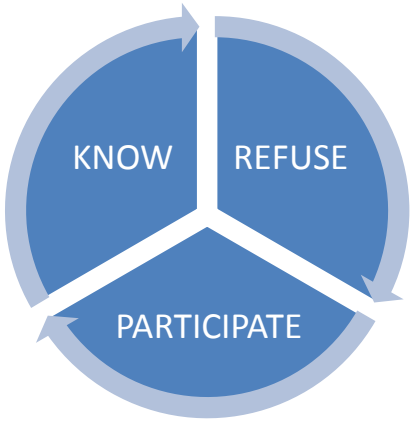
Appendix "A"-Rights and Responsibilities of Employees

Each and every employee has certain rights under provincial Occupational Health and Safety law, including:

- Right to Know about the hazards within their workplace - All persons have the right to know of any working condition that may in any way pose a health safety and environmental hazard or risk within the workplace; (e.g. WHMIS).

- Right to Refuse hazardous work - All personnel have the right to refuse work when they have reasonable grounds to believe that the work may be hazardous to them, to their fellow worker and to the facility/vessel.

- Right to Participate in the development, implementation and improvement of environmental health, and safety programs - All persons have the right to participate in identification and management of Health and Safety issues; e.g. JOHS Committee



Right to Know

The Nalcor Energy-Lower Churchill Project, in cooperation with its major contractors, will use a variety of processes to ensure all employees, including contractors, sub-contracted employees and following consultants are informed of any hazards that may be present in the workplace. These programs include the following:

- Employee Training and Orientations
- Occupational Safety & Health Committees/Representatives

- Group Safety Meetings
- Task Based Job Safety Analyses
- Permit to Work System
- Onsite Emergency Drills
- Signage and Placards
- Safety Alerts and Bulletins

Additionally, applicable Health and Safety documents and relevant legislation including the Contractor Safety Plan will be made readily available to all personnel.

Right to Refuse

As per section (45) of the Newfoundland and Labrador Occupational Health and Safety Act – Chapter O-3 (1992):

1. A worker may refuse to do work that the worker has reasonable grounds to believe is dangerous to his or her health or safety, or the health and safety of another person at the workplace:

    a. Until remedial action has been taken by the employer to the worker's satisfaction;
    b. Until the committee or worker health and safety representative has investigated the matter and advised the worker to return to work; or
    c. Until an officer has investigated the matter and has advised the worker to return to work.

2. Where a worker refuses to do work under subsection (1) his or her employer may reassign the worker to other work that is reasonably equivalent to the work he or she normally performs and the worker shall accept the reassignment until he or she is able to return to work under subsection (1).

3. Where a worker is reassigned to other work under subsection (2) the employer shall pay the worker the same wages or salary and grant him or her same benefits the worker would have received had the worker continued in his or her normal work.

4. Where a worker has reasonably refused to work under subsection (1) and has not been reassigned to other work under subsection (2) the employer shall pay the worker the same wages or salary and grant the worker the same benefits the worker would have received had the worker continued to work, until he or she is able to return to work under subsection (1).

5. A reassignment of work under subsection (2) is not discriminatory action under section

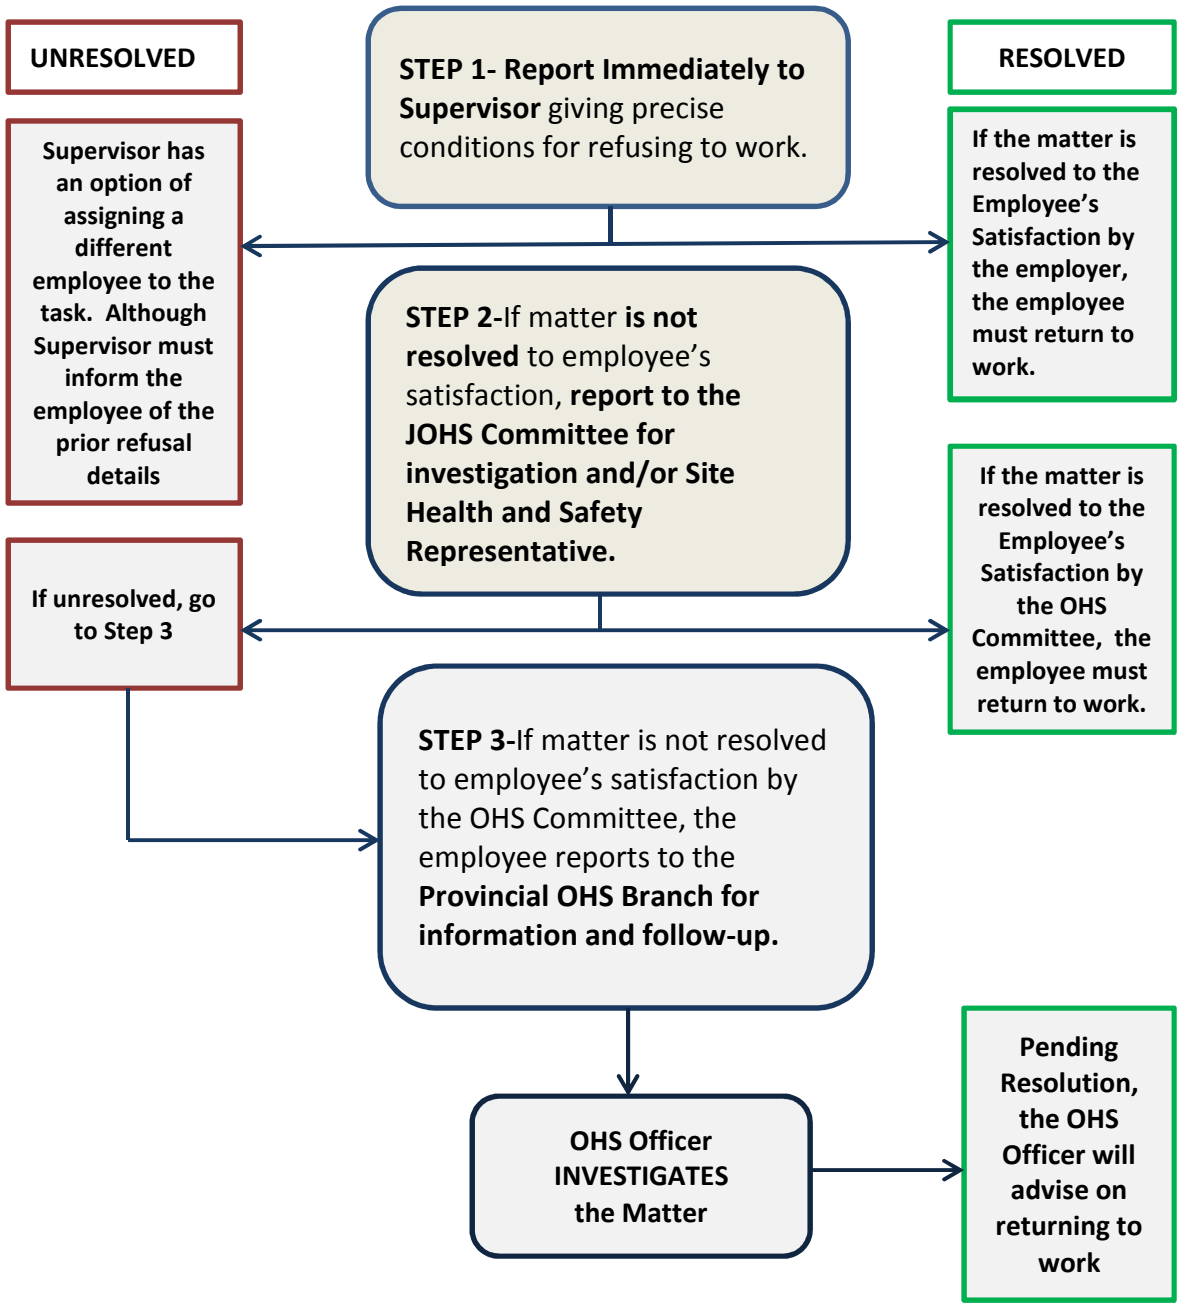
Discriminatory Action Prohibited

Section 49 of the Health and Safety Act of Newfoundland and Labrador states that an employer or union shall not take a discriminatory action against a worker by dismissing him or her or by deducting wages, salary or other benefits, or by taking other disciplinary action against him or her:

- Because of the worker's participation in or association with the committee, worker health and safety representative or workplace health and safety designate at the workplace, or because the worker is a worker health and safety representative or workplace health and safety designate;
- Because the worker has testified or is about to testify in a proceeding or inquiry under this Act or regulations;
- Because the worker has given information to the Workplace, Health, Safety and Compensation Commission, an officer or another person concerned with the administration of the Act or the regulations concerning the health, safety and welfare of workers at his or her workplace; or

- Because the worker has reasonably refused to work under his or her right to do so.

Right to Refuse- Three Step Process For Resolution (as per OHS Act):



Right to Participate (JOHS Committee)

Under PART IV of the OCCUPATIONAL HEALTH AND SAFETY ACT - COMMITTEES, REPRESENTATIVES AND DESIGNATES section (25) of the act identifies the Operations of committees, representatives and designates;

An employer shall ensure that:

- An occupational health and safety committee is established;
- a worker health and safety representative is appointed; or
- a workplace health and safety designate is designated; and
- a copy of the Act/ regulations under the Act are easily accessible.

Minutes of all regular meetings and special committee meetings shall be recorded in the form prescribed by the commission and one copy shall be kept on file with the committee, one copy shall be filed with the commission, one copy shall be posted in a prominent place in the workplace and one copy shall be forwarded to Nalcor Energy-Lower Churchill Project Health and Safety Group.

A worker health and safety representative or a workplace health and safety designate shall report to the commission in the form required by the commission.

An occupational health and safety committee shall:

- Meet within 2 weeks of its establishment;
- Elect co-chairpersons as required by subsection 38(6) of the Act;
- And notify the commission of the elected co-chairs.

Health and Safety (JOHS) Committee

It is the policy of the Nalcor Energy-Lower Churchill Project as well, as a regulatory requirement,` to ensure that all personnel are provided an opportunity to be involved in EHS development and improvement efforts. Formal Health and Safety Committees provide leadership and direction for the company and its business units and allow for participation and input at all levels. The Health and Safety Committee structure is designed to establish positive,

two-way communication throughout the organization and facility. The organization and function of the Health and Safety Committee shall be designed to meet the intent of applicable Newfoundland and Labrador legislation. The Committee shall:

- Consist of at least equal worker and management representation; Conduct meetings on a regular monthly basis or (every 3 weeks for rotational crews where applicable);
- Prepare Committee meeting minutes and post minutes on the vessel or in onshore office bulletin boards for worker review and submit signed copies of these minutes to the Operator and the regulator; and
- Shall seek to identify aspects of the workplace that may be unhealthy and/or unsafe.

In addition, as required under the Occupational Health and Safety Regulations, the Committee shall

- Be notified and consulted where there is a likelihood that the safety or health of an employee is, or may be, endangered by exposure to a hazardous substance;
- Be informed of all injuries and other “Hazardous Occurrences”; and
- Participate in incident investigations.
- Have the right to accompany an officer of the division when health and safety inspections are being conducted.

NOTE: During the Nalcor Energy-Lower Churchill Project all Safety Committees shall hold meetings on a monthly basis. If there are worker crews who change shift (e.g. every 3 weeks for rotational crews where applicable) each crew will have in place a safety committee.

Section 9.0 – Appendix "B"

Health and Safety Training

Appendix "B": Health and Safety Training

The following Health and Safety Training Opportunities will be provided to Employees, Consultants and Contractors to ensure core competencies are established and maintained.

Health and Safety Induction/Orientation

Prior to mobilization to any of the Lower Churchill Project work sites an Health and Safety Inductions/Orientations will be conducted for all LCP senior management personnel, employees, contractors, subcontractor, visitors and consultants. The Induction/Orientation shall provide an overview of the LCP and Contractor Health and Safety Programs and the Induction/Orientation will include the following:

- Project Overview
- Health and Safety Goals and Objectives
- Health and Safety Responsibilities
- Alcohol and Drug Policy
- Communications
- Training & Competency
- Hazard Identification and Reporting
- Personal Protective Equipment
- Site Specific Safety Policies
- Inspections and Audits
- Incident Reporting and Investigation
- Environmental Protection and Waste Management
- Emergency Preparedness
- Site Security

Informal Communications and Promotion

In addition to the induction and orientation, communication of Health and Safety Performance related information:

- Monthly Health and Safety Performance Updated
- Notices and Bulletins

- Safety Alerts
- Posters

Personnel Qualifications Competency and Training

The Lower Churchill Project will ensure all project personnel are suitably qualified and trained as per the Contractor's "Training Matrix". The company training matrix will identify the training requirements for each position within the contractor's organization and will comply with Provincial and Federal legislative requirements and guidelines. Internal controls will be established by the Lower Churchill Project to ensure all appropriate personnel comply with the requirements and contractual arrangements and will require all contractors to cooperate in this effort.

Contractor's formal and in-house competency and training programs must consider the level of training required for the position and responsibilities of the personnel involved. The aim of their training programs is to provide an understanding of their procedures, equipment, risks and potential hazards that may occur. Details respecting Contractor's Competency and Training process shall be guided by the following:

- Selection and Control of Contractor Personnel;
- Competence Assessment and Records;
- Training;
- Induction Programs.

Health and Safety Training Matrix

Contractors will maintain independent training matrices which identifies the training requirements for each position in their respective organizations. The training matrix will be maintained up to date to ensure that personnel onshore/offshore have received the required regulatory and job specific training.

Service companies will be required to maintain a training matrix to ensure that all personnel who are working onshore/offshore on vessel are trained and competent in their positions. Training Matrices must be made available on work vessels (as appropriate) and at the worksites onshore/offshore.

Section 9.0 – Appendix “C”

Hazard Identification and Evaluation

Appendix "C": Hazard Identification and Evaluation

Job tasks will be reviewed and assessed for hazards/risks and risk management will be applied and utilized to reduce the risk as low as practicable. The following Nalcor risk methods and programs will be utilized on the Lower Churchill Project:

Be Safe Program

BeSafe is a behavior-based safety program designed to develop skills in employees so that they can have respectful safety discussions with others. It is part of Nalcor's second phase of a safety culture initiative aimed at strengthening personal responsibility for safety. It provides a standard conversational structure with which respectful discussions can occur around positive safety behaviours or potentially unsafe behaviors.

It allows employees to: Clearly and respectfully communicate safety concerns or observations, reinforce positive safety behaviours and engage in a collaborative problem solving approach to identify options to overcome potentially unsafe behaviours.

The objectives of the *BeSafe* program are to: understand key components of Nalcor's Safety Culture including Personal Responsibility for Safety. understand what ***BeSafe*** is and why it is needed and practice ***BeSafe*** discussions

BeSafe is a 3-step process that provides guidance on safety conversations.

1. Say Something	**B** **E** **S**	Behaviour is the focus Express your observations Safety is the motivation
2. Discuss Options	**A** **F**	Acknowledge the other person's view Form an agreement
3. Express thanks	**E**	Express gratitude

Task Based Risk Assessment (TBRA)

The "Task Based Risk Assessment (TBRA)" will provide LCP personnel with guidance and information with respect to the assessment of risk associated with hazards that will be present in the activities of the Lower Churchill Project. A TBRA will be conducted and/or reviewed when the following circumstances apply:

- When a job is being undertaken for the first time and the risks are unknown
- For non-routine jobs or new jobs where experience is limited
- Any job that is intuitively deemed to be a high risk
- IF IN DOUBT- CARRY OUT A JOB SAFETY ASSESSMENT (TBRA)

During the planning and preparation phase, TBRA, including hazard identification and hazard analysis, will be conducted by a multi-discipline team that brings expertise and knowledge in Construction, Drilling, Engineering, Operations and Health and Safety. All contractors involved in Task Based Risk Assessments will follow their own Risk Matrix System if compatible and acceptable to the Lower Churchill and Nalcor Energy corporate "Tasked Based Risk Assessment" procedure. The identification of occupational work hazards will be conducted utilizing but not limited to the following guidelines;

- Hazard Identification
- Specific Hazard Assessment
- Identify Hazard Effect and who may be affected
- Identify Risk Rating
- Identify Controls
- Review Residual Risk After Controls Are Applied
- Document and Record
- Approval to Proceed

- Permit to Work Systems
- Regular Site Inspections by the Contractor Health and Safety Personnel and
- Audit of compliance and effectiveness to Safety Management Systems periodically assisted or conducted by Lower Churchill Project Health and Safety Personnel.

The need for continual monitoring and identification of hazards both at the operations and management levels is recognized as important by Lower Churchill Project and Contractors. These systems are in place to ensure that all incidents are reported, the causes investigated and any necessary amendments made to operating practices or training of personnel are detailed in the Health and Safety Management Systems.

All Health and Safety risks, including risks associated with change, must be identified and effectively managed. Task Based Risk Assessment identification includes evaluating and prioritizing risks utilizing the Lower Churchill Project Risk (or contracted company) matrix to establish a definitive overall risk characterization and then eliminating or controlling the risks. These systems confirm that there is a two-way flow of communication/ information between all project personnel.

In addition to pre-tour meetings, toolbox/tailgate meetings, work permits, etc., a TBRA gives the crew performing a particular job the opportunity to formally identify the dangers and hazards associated with that job and also what potential injuries and/or damage could result from them. Further, it allows the crew performing that job to clearly communicate what is to be done in order to eliminate or isolate those dangers and hazards so the work can be completed safely. Wherever possible, an alternative means of accomplishing the activity that removes the risk entirely shall be sought.

Inspections and Audits

Lower Churchill Project Inspections and Audits shall be conducted on the contractors to identify potential health and safety issues. The purpose of the inspection and audit process is to:

- Identify and correct actual or potential hazards;
- Ensure continued compliance with regulations and company standards;

The following is a summary of potential inspections/audits for the marine vessels and equipment:

- Transport Canada Inspections;
- Classifications Survey;
- Nalcor Energy-Lower Churchill Project Inspections and Audits.

A Health and Safety Inspection Checklist is included in Appendix "O"

Behavioral Based Safety Program

A Behavioral Based Safety Program is a tool used to continuously improve safety performance through the identification, observation and reduction of at-risk behaviors and the elimination of incidents. Contractors who have these programs in place will use their programs to enhance overall safety performance in the work place (e.g. STOP, etc.). These programs shall be similar to the Lower Churchill Project and Nalcor Energy Corporate "Safe Workplace Observation Program (SWOP) (see it – fix it – report it)". This tool is for all employees to use when identifying or observing hazards in the work place. The workers shall immediately correct and/or report potential hazards to their immediate supervisors and shall use the Nalcor Energy-Lower Churchill Project SWOP program or the contractor's similar booklet to record the hazard observation and actions taken to mitigate such hazards.

The Lower Churchill Project has a goal of becoming a safety leader. One of the key components in achieving "best in class" safety performance is a well developed system for the reporting, review, and analysis of sub standard conditions and practices (acts) as well as loss and "near miss" incidents.

The Safe Workplace Observation Program (SWOP) has been designed with a simple concept in mind: If an individual sees something that does not appear to be safe, if appropriate, they must

take immediate action to correct it and then report the situation to their Supervisor for follow-up.

By reporting your "Observations" an individual will be helping to ensure that the conditions, practices (acts), or situations that create hazards in the workplace are identified, analyzed, and corrected before a significant loss can occur.

Since it is also important to recognize when something is done well, SWOP also has a commendation component to recognize the importance of celebrating successful safety performance.

Permit to Work (PTW)

Nalcor Energy-Lower Churchill Project takes into consideration that contractors will operate their business aspects at the work site and will require contractors to employ a permit to work system.

A "Permit to Work" system is a formal written system which provides a means of managing non-routine and higher risk tasks and activities. The permit to work procedures provide a method for supervisors and crew members to follow when undertaking certain types of tasks recognized to generate particular exposures to personnel or the site. The PTW system also furnishes management a formal method to administratively coordinate and control work that may adversely impact other concurrent work, impair safety systems or otherwise endanger personnel at the work site. The permit to work also provides a means of formal communications between personnel involved with the permitted job and those personnel that may be affected by it, and supervisors who have influence on how, when and where the work is done. The PTW system shall:

- Limit the scope of the task;
- Ensure supervisors and crew members follow procedures, are well informed, understand and follow the applicable safety precautions and recognize the need for and use of required safety equipment; (E.g. Personal Protective Equipment)
- Control the work within specified time limits;
- Encourage pre-task planning in order to minimize risk to personnel at the work site, and reducing the inconvenience and interference to other operations/activities as well as reduce any adverse impact;

- Enhance awareness of personnel responsible for overall safety by providing documented details of any known risks, of potentially hazardous activities in progress and appropriate mitigating measures;
- Provide a continuous control and record of ongoing work activities, detailing the nature of the work, required precautions/safeguards, and the responsible competent person in charge, this control and recording will be identified in a detailed "Permit to Work" system/process;
- Ensure that upon completion of work, equipment and site are left in a fully operable state, as well as a tidy and safe condition; and
- Provide formal notification of completion of all work to the Person in Charge (PIC). This notification is a part of a "Permit to Work" system/process.

The issue of a permit to work does not, by itself, make a job safe. A permit to work is not simply permission to carry out a potentially hazardous task, but a critical communications and training tool for all affected personnel. It is part of a clearly defined system which assists in determining how a job can be performed safely; precautions that may need to be taken; specific procedures to safely perform the task; and ways to reduce the risk and hazards related to specific tasks. In accordance with Health and Safety Procedures, the use

of permits is mandatory for certain operations; these include but are not limited to the following:

- Pressurized systems where there is a possibility of pressure release;
- Any marine vessel work performing over the side work;
- Hot/Cold work;
- Entry into confined space;
- Working on or isolating mechanical, pneumatic or electrical equipment;
- Any diving activities;
- Work involving handling of dangerous materials such as explosives etc.; and
- Heavy lifts.

All new personnel shall receive induction and awareness training on the PTW and contractor JRS where applicable or the Lower Churchill Project TRSA process if required.

Incident Investigation and Reporting

The Lower Churchill Project is committed to providing a safe and healthy workplace for its employees, contractor personnel, subcontractor personnel, vendors and the general public. Safety is our No. 1 priority and it is one of the company's seven core values. Nalcor is committed to ***Zero Harm – Nobody Gets Hurt***. We believe this is both achievable and sustainable, while we each have a personal responsibility for safety. The incident management plan must reflect the uniqueness/specifics of the work to be carried out and associated work locations.

Every Accident/Incident is a combination of causes. The Lower Churchill Project through the application of our Health and Safety Management system will endeavor to prevent incidents from occurring. The Lower Churchill Project encourages a culture where accidents/incidents are reported without prejudice. The Lower Churchill Project's Health and Safety Management system will be used to identify and report all accidents/incidents that occur in the workplace. In the event that an accident/incident does occur it will be investigated to the extent required to determine the basic and root cause and to effect appropriate corrective actions.

Accident/Incident investigations will be initiated as promptly as possible. The findings of the investigations will be documented and appropriate recommendation(s) will be developed and communicated to prevent recurrence of similar or other incidents. The appropriate ensuring

recommendations will be assigned to an individual/position and implemented. All decisions and actions will be communicated.

Any accident/incident that could have resulted in significant injury or property damage (near miss) and all incidents that result in injury or property damage (including spills) will be investigated.

Accidents/Incidents (A/I) Investigations

Accidents and Incidents that must be investigated include the following:

- Fatalities
- Lost Time
- Medical Aid
- Vehicle Accidents/Incidents
- Fires and Explosions
- Chemical and Pollutant Spills
- High Potential Near Miss incident

All employees are required to report any and all accidents/incidents/near miss incidents/spill hazard to their immediate Supervisor immediately. The supervisor will discuss the occurrence with the reporter in order to determine corrective actions. The Supervisor will immediately report the accident/incident/near miss incident/spill hazard to his Manager who will in turn report to the Lower Churchill Project representative on site immediately or within a 24 hour period of being notified of the incident. A final written A/I report shall be forwarded to the Lower Churchill Project representative no later than 14 days after the initial report was made. The A/I report shall identify the basic and root causes, recommendations and responsible person to ensure that recommendations and actions are completed and closed. The Contractors/sub-Contractors shall ensure that mitigations are taken and ensure that such incidents may never re-occur.

Accident/Incident Regulatory Reporting Requirements

Under section 54 of the Newfoundland and Labrador Health and Safety Acts and Regulations requirements:

1. Where an accident takes place at a workplace:

- That results in serious injury to a person or results in the death of a person; or
- That had, or continues to have, the reasonable potential of causing serious injury to or the death of a person

The employer, or principal contractor shall immediately notify the Assistant Deputy Minister of the accident by reporting through the 24 Hour Accident Reporting Line (709) 729-4444.

2. Where an accident is reported under subsection (1), notification shall immediately be given to the committee, the worker health and safety representative or the workplace health and safety designate.

Section 9.0 – Appendix "D"

Changes and Modifications to Procedures and Equipment

Appendix "D": Changes and Modifications to Procedures and Equipment

Modification of Contractors Procedures and or Personnel

Changes and modification applies to changes to programs, procedures, equipment and organizational structure, which may impact the health, safety, environment and financial wellbeing of the project. To better manage and control significant and/or major changes to or within the organization or contracted companies may require a more formal approach to accomplish the desired changes efficiently (e.g. Change Management). Such changes shall be reviewed through the Task Based Risk Assessment process, as any significant and critical changes should be subjected to an analysis, assessment and communication process.

Contractor Equipment Modification

Where significant modification are intended, it is the responsibility of the contractor to ensure that changes process is followed and a formal approval process is initiated for any significant equipment modifications. Depending upon the degree of modification requested a certifying authority's approval may be required.

Equipment Fitness for Purpose

Any equipment used within the Lower Churchill Project, where applicable, shall have a Certificate of Fitness (CoF) for the area of operations. The contractor shall ensure that equipment complies with any regulatory requirements and industry standards and maintained. For example if a marine vessel is to be used on the Lower Churchill Project it shall meet all Transport Canada classification requirements, either costal trade or ocean going. Any equipment on the vessel that is not under the jurisdiction of Transport Canada may be certified by a certifying company (e.g. DnV). All certificates for vessels/equipment must be made available on the vessel or equipment used onshore must have a current safety inspection certificate and be made available for review.

The Lower Churchill Project will ensure that all Contractor equipment is fit for purpose. Only appropriately certified equipment will be used. If proper certification does not arrive with the equipment, the equipment will not be put into service until such time as verification can be made.

Any additional HS critical equipment requires appropriate certification prior to use (e.g. pressure vessels, materials handling equipment and lifting gear). It is the responsibility of the

Contractor to ensure that any such additional equipment is fit for purpose and safe to use prior to commencing service.

All lifting equipment (e.g. lifting slings, shackles, pad-eyes, etc.) is visually inspected by a competent person from the contractor prior to use and certified by a qualified 3rd party at least semi-annually. Certification certificates must be at the work site for review by the Lower Churchill Project personnel. A color coding system shall be in place for the purpose of identifying dates for inspection and/or testing. All Kevlar slings must be kept stowed in a secure area of the Tool Room and shall be used for specific uses only and visually inspected prior to each use and again before returning to the Tool Room.

The Lower Churchill Project will foster recognition and agreement from all contractors that reliance on the certification process alone is not sufficient to reduce operational risk of equipment design and construction to “As Low As Reasonably Practicable” (ALARP), and that this requires the personal, active, and visible involvement and participation of all workers and management at all levels.

Section 9.0 – Appendix "E"

Work Standards, Practices and Procedures

Appendix "E": Work Standards, Practices and Procedures

The work standards, practices and procedures described in this section are designed to reduce the likelihood of accidents/incidents in the workplace and are consistent with the Lower Churchill Project safety policies and procedures, safety management principles and legislative requirements. This section does not, however, cover all aspects of safety and special circumstances that may arise which will require professional judgment and common sense.

Occupational Health Hazards

The health hazards most commonly encountered in worksite operations include the following:

- **Chemical Hazards** - Hazards resulting from harmful exposure to hazardous chemicals stored, handled or used in the workplace.

- **Illumination Hazards** - Hazards resulting from prolonged exposure to inadequate levels of lighting.

- **Radiation Hazards** - These are hazards resulting from exposure to harmful levels of ionizing and non-ionizing radiation.

- **Biological Hazards** - These are hazards resulting from exposure to living organisms such as viruses, bacteria, fungi and parasites.

Control of Occupational Hazards

The following engineering and administrative controls, safe work practices and personal protective equipment will be used to control exposure to occupational health hazards:

Chemical Hazards

As per the Canadian Federal requirements all worker working in a work place that will be exposed to or working in close proximity to Chemicals and Controlled products will have completed training in Workplace Hazardous Materials Information System (WHMIS), or equivalent training.

Noise Hazards

Where sound levels in a space exceed 85 dB, the entrance(s) to that space will be fitted with a sign identifying it as a “High Noise Area”. The maximum time exposure of a worker in that space will not exceed the limits prescribed the American Conference of Governmental Industrial Hygienists Threshold Level Booklet. Where it is not reasonable or practicable to maintain the prescribed limits, appropriate hearing protection will be used.

Illumination Hazards

All lighting systems, including emergency lighting, will be properly maintained.

Radiation Hazards

Storage, handling and use of radioactive substances will be licensed by the Canadian Nuclear Safety Commission. The amount of radioactive substances will be kept at a minimum stock necessary to carry out operations, and will be stored away from accommodation areas and passageways in a steel weather-proof container that is properly labeled.

Biological Hazards

Hygiene inspections will be conducted of accommodation areas, including food storage and preparation areas where applicable.

Section 9.0 – Appendix “F”

Personal Protective Equipment

Appendix "F": Personal Protective Equipment

All persons working on the LCP including visitors, will be required to use personal protective equipment (PPE) that is appropriate for the work being performed and the nature of the hazards involved. No person will be permitted to enter an area, or perform any work, where personal protection is required unless that person is correctly attired with the necessary protective clothing or equipment.

All personnel on site will be required to wear standard PPE (i.e, hard hat (with side impact protection), safety boots, high-visibility safety vest, and safety glasses meeting requirements noted below). With respect to the requirements for additional PPE, a risk assessment will be carried out prior to work commencement to determine additional PPE requirements considering site conditions, the nature of the work activity and associated safety risks.

Nalcor Energy requires contractors to ensure that their personnel are instructed in the proper use and care of that equipment.

Cold Temperature Clothing

Clothing must be suitable for the working conditions and must provide protection for low temperatures, high wind velocities and the resulting wind chill factors. The following chart is for determining wind chill factors:

Wind Speed (km/hr)	Air Temperature (Celsius)																
	0	-1	-2	-3	-4	-5	-10	-15	-20	-25	-30	-35	-40	-45	-50	-55	-60
6	-2	-3	-4	-5	-7	-8	-14	-19	-25	-31	-37	-42	-48	-54	-60	-65	-71
8	-3	-4	-5	-6	-7	-9	-14	-20	-26	-32	-38	-44	-50	-56	-61	-67	-73
10	-3	-5	-6	-7	-8	-9	-15	-21	-27	-33	-39	-45	-51	-57	-63	-69	-75
15	-4	-6	-7	-8	-9	-11	-17	-23	-29	-35	-41	-49	-54	-60	-66	-72	-78
20	-5	-7	-8	-9	-10	-12	-18	-24	-30	-37	-43	-49	-56	-62	-68	-75	-81
25	-6	-7	-8	-10	-11	-12	-19	-25	-32	-38	-44	-51	-57	-64	-70	-77	-83
30	-6	-8	-9	-10	-12	-13	-20	-26	-33	-39	-46	-52	-59	-65	-72	-78	-85
35	-7	-8	-10	-11	-12	-14	-20	-27	-33	-40	-47	-53	-60	-66	-73	-80	-86
40	-7	-9	-10	-11	-13	-14	-21	-27	-34	-41	-48	-54	-61	-68	-74	-81	-88
45	-8	-9	-10	-12	-13	-15	-21	-28	-35	-42	-48	-55	-62	-69	-75	-82	-89
50	-8	-10	-11	-12	-14	-15	-22	-29	-35	-42	-49	-56	-63	-69	-76	-83	-90
55	-8	-10	-11	-13	-14	-15	-22	-29	-36	-43	-50	-57	-63	-70	-77	-84	-91
60	-9	-10	-12	-13	-14	-16	-23	-30	-36	-43	-50	-57	-64	-71	-78	-85	-92
65	-9	-10	-12	-13	-15	-16	-23	-30	-37	-44	-51	-58	-65	-72	-79	-86	-93
70	-9	-11	-12	-14	-15	-16	-23	-30	-37	-44	-51	-58	-65	-72	-80	-87	-94
75	-10	-11	-12	-14	-15	-17	-24	-31	-38	-45	-52	-59	-66	-73	-80	-87	-94
80	-10	-11	-13	-14	-15	-17	-24	-31	-38	-45	-52	-60	-67	-74	-81	-88	-95
85	-10	-11	-13	-14	-16	-17	-24	-31	-39	-46	-53	-60	-67	-74	-81	-89	-96
90	-10	-12	-13	-15	-16	-17	-25	-32	-39	-46	-53	-61	-68	-75	-82	-89	-96
95	-10	-12	-13	-15	-16	-18	-25	-32	-39	-47	-54	-61	-68	-75	-83	-90	-97
100	-11	-12	-14	-15	-16	-18	-25	-32	-40	-47	-54	-61	-69	-76	-83	-90	-98
105	-11	-12	-14	-15	-17	-18	-25	-33	-40	-47	-55	-62	-69	-76	-84	-91	-98
110	-11	-12	-14	-15	-17	-18	-26	-33	-40	-48	-55	-62	-70	-77	-84	-91	-99
	0 to -10 Low			-10 to -25 Moderate			-25 to - 45 Cold			-45 to -59 Extreme			-60 Plus very Extreme				

High Visibility Vests, Coats, Shirts, Jackets on the work site must be compliant with the most current CSA Z96.1 standard.

All personnel working near "energized" electrical equipment or transmissions lines shall wear Fire Retardant Coveralls (Nomex or equivalent). All coveralls must be equipped with high visibility materials/reflective stripping as per the latest CSA Z-96.1 standard.
When construction site personnel are exposed to the hazard of moving vehicles or heavy equipment, they shall wear distinguishing apparel containing highly visible material suitable for daytime or night time use. Work Vests, Coveralls or Jackets must be equipped high visibility, reflective striping as per CSA Standard- Z 96.1, "Guideline on the Selection, Care and use of High-Visibility Safety Apparel (HVSA)."

Protective Headwear

Protective hard hats are designed to protect the wearers' head from impact (including side impact) and penetration of falling objects. All personnel will ensure that their industrial protective headwear meets the design standards set out in CSA Standard CAN/CSA Z94.1-92 will be worn when outside offices and other exempt areas. Hardhat liners or other apparel suitable to protect the neck and head from cold injury must be worn with the hardhat in extreme cold. All hard hats must be provided with side impact protection.

Protective Footwear

Protective footwear that meets the design standards set out in CSA Standard CAN/CSA Z195-02 (Green Triangle) will be worn when outside offices and other exempt areas. Safety boots must have Grade 1 Toe Protection. Those personnel working in and around electrical power generation and transmission links must wear electrically resistive safety boots (Orange Omega Symbol) In terrain conditions where there is a risk of ankle injury or falls, footwear with ankle support (between 6 and 8 inches boot height) and aggressive treads must be worn on the site.

Eye and Face Protection

Eye and face protective equipment that meets the design standards set out in CSA Standard CAN/CSA Z94.3.1 will be worn where there is a potential for an injury to the eyes, face, ears or front of the neck. Industrial safety glasses with permanent side shields will be worn when outside offices and other exempt areas. Plastic Lenses must be treated to block UV rays. Safety glasses must have non-conductive frames. CSA approved safety eyewear is required at all times on work sites, except in vehicles and camp facilities.

The minimum standard for eye protection is CSA approved safety glasses with fixed side shields. Full-face shields, mono goggles or other types of eye protection must be worn when safety glasses are not adequate to protect from impacts (i.e. grinding, abrasive blasting etc.).

Contact lenses should not be worn in areas where dust is common or strong chemicals are used. Where there is a potential for chemical or particulate exposure to the eyes, ensure an appropriate portable eye-wash system, capable of delivering approximately 0.4 gallons per minute for at least 15 minutes, is readily available. Safety goggles face shields or glasses with

side shields are also required to be worn to protect from splashes or particle projectiles. Contact lenses should always be removed to adequately flush foreign substances from the eyes. Prescription vision correcting eyeglasses must be CSA approved safety glasses with rigid side shields or worn under approved safety glasses.

Hearing Protection

Hearing protection that meet the design standards set out in CSA Standard Z94.2-02 will be used where sound levels exceed 85 decibel. CSA Standard Z94.2 94 hearing protectors such as earmuffs or earplugs will be available and worn in high noise areas (above 85 dB (A) or whenever there is a risk of hearing impairment. Workers should be made aware of their reduced ability to hear warnings and noises when wearing ear protection.

A contractor whose workers will be exposed to noise levels at or in excess of 85 dB(A) must have a noise management plan. The plan will address how workers will be monitored and protected from excess noises.

Hand Protection

Gloves suited for the work will be worn to protect against cuts, burns, electricity, chemicals and exposure (heat or cold) to the elements. In most cases, cotton work gloves suitable for visitors/inspectors to the work site. For material and equipment handling tasks, leather palmed gloves must be worn to provide adequate hand protection. For handling chemicals or hydrocarbon products, chemical resistant gloves must be worn. For any question regarding types of gloves for a particular task, the supervisor or safety representative should be contacted.

Skin Protection

An apron, full-face shield and rubber gauntlet-style gloves will be provided to every person required to handle caustic soda, acids or other corrosive products. Barrier creams or lotions will be provided to workers who may experience a rash on their skin from chemical irritants.

Fall Protection

Every person who works from an unguarded structure that is more than 2.4 m above the nearest permanent safe level, or is above an open pit, hopper, moving machinery parts or water, will use fall protection equipment that meets the design standards set out in CSA Standards Z259.2.1-98 (CAN/CSA-Z259.10-06 - Full Body Harnesses). Fall protection systems may include barricades, guard rails, work platforms and scaffolding. Contractors must use fall protection to protect themselves from falling. In addition, personal fall restraint and arrest systems will be used where necessary.

- Ensure that systems are designed and constructed as per regulatory requirements.
- Ensure temporary structures are inspected prior to use, regularly during use and when transferred.
- Ensure all fall arrest systems, devices and procedures comply with regulatory requirements.
- Ensure workers who will use fall protection systems are competent and adequately trained in fall protection systems (i.e. hazards, use, limitations, inspections etc.).The Newfoundland OHS Regulations require that all workers required to utilize fall protection equipment must complete a training program on fall protection as prescribed by the WHSCC.
- Ensure workers have reviewed the fall protection rescue plan and signed off to ensure they understand it.
- Fall restraint systems must be used when working above, over moving machinery or over water where, due to temperature or depth, or current movement, self-rescue is difficult or impossible.
- Ensure lifelines optimize connection points for workers' personal fall-arrest devices.
- Ensure workers connect lanyards so that the maximum free fall is restricted to 1.2m or otherwise prescribed in current regulatory requirements. Position personnel to prevent pendulum swing falls
- Part of the harness system is a shock absorbing lanyard with locking snaps. Ensure the shock-absorber end is always connected to the safety harness. It is recommended that a full body harness with two shock absorbing lanyards attached to the back "D" ring is worn. NOTE: Fall arrest systems may have various applications during the course of the project and their configurations could be different from what is recommended above. Any deviations to the system noted above should be approved by the LCP Muskrat Falls Health and Safety Manager or LCP Muskrat Falls Health and Safety Coordinator.
- Ensure anchoring points meet the health and safety requirements
- A subcontractor whose workers are exposed to the risk of falling must have a fall protection plan for the work. The plan must assess the fall hazards, fall protection and maintenance of fall protection equipment and the plan must be communicated with all workers at the job site.

Drowning Protection

All personnel working near or over the water are required to wear a personal flotation device meeting CAN/CGSB – 65-CCP-14M. Additionally, all personnel who work over-the-side of a marine vessel or in an area where there is a danger of falling overboard will be required to use a life jacket or personal floatation device that meets the design standards set by the Canadian General Standards Board and the Canadian Shipping Act and Regulations. The floatation device must meet the CGSB Standard CAN/CGSB 65.11-M88 or equivalent.

Respiratory Protection

In areas or spaces where there is a hazard of an airborne hazardous substance or an oxygen deficient atmosphere, respiratory protection equipment that is listed in the NIOSH Certified Equipment List will be required. Training will be provided specific to the equipment to be used

prior to actual usage. Respiratory Protection must be CSA approved and meet the requirements of CSA Z94.4. (Selection, Use and Care of Respirators)

Section 9.0 – Appendix “G”

Working in Cold Environments

Appendix "G": Working in Cold Environments

The ability of workers to function and work normally in cold environments is affected by the degree and extent of exposure to sub-zero conditions. Additional precautions must be considered with regard to using lifting equipment in extreme cold temperatures.

Contractors must be adequately prepared to ensure personnel are not put at risk due to exposure to cold conditions. The following standards must be followed when personnel are required to work in cold conditions. The changes to human performance under such conditions are due to two main factors:

1. The environmental temperature
2. The clothing required to maintain a safe core body temperature and to fully function in the environment in the execution of an assigned task.

Cold Safe Work Standards

Rest breaks must be planned for and utilized to allow workers to warm up particularly their extremities. These breaks should not be less than 10 minutes in length and should be taken in a heated area. Outer clothing should be removed to prevent overheating and sweating when in the heated area. Returning to cold work while damp or sweaty may result in rapid chilling. The following recommended work practices should be followed:

Under conditions of continuous work in the cold:

- Heated warming shelters (i.e. bus, vehicles) should be provided. Workers should be encouraged to use these at regular intervals, the frequency of use depending on the severity of environmental exposure.

- When entering the heated shelter, outer and middle clothing layers (as necessary) should be removed to prevent overheating and to permit dampness to evaporate. A change of dry clothing may be necessary.

- Warm fluids should be consumed at the work site to provide energy, warmth, and replace fluids lost during work. Significant fluid loss can occur in the cold due to sensible and insensible sweating, breathing, and the extra energy requirements of working in the cold. Dehydration in the cold is a serious concern, increasing a worker's susceptibility to hypothermia.

- The onset of severe shivering, the feeling of excessive fatigue, drowsiness, irritability or euphoria are indications for immediate return to the shelter.

Warm up Schedule for Cold Temperatures

AIR TEMPERATURE SUNNY SKY		NO NOTICEABLE WIND		8 KPH WIND		16 KPH WIND		24 KPH WIND		32 KPH WIND	
°C	°F	Max. Work Period	No. of Breaks	Max. Work Period	No. of Breaks	Max. Work Period	No. of Breaks	Max. Work Period	No. of Breaks	Max. Work Period	No. of Breaks
-26° to - 28°	-15° to -19°	Normal work hours and break periods	1	Normal work hours and break periods	1	75 min.	2	55 min.	3	40 min.	4
-29° to -31°	-20° to -24°	Normal work hours and break periods	1	75 min.	2	55 min.	3	40 min.	4	30 min.	5
-32° to -34°	-25° to - 29°	75 min.	2	55 min.	3	40 min.	4	30 min.	5	Non-emergency work should cease	
-35° to - 37°	-30° to -34°	55 min.	3	40 min.	4	30 min.	5	Non-emergency work should cease			
-38° to - 39°	-35° to -39°	40 min.	4	30 min.	5	Non-emergency work should cease					
-40° to -42°	-40° to -44°	30 min.	5	Non-emergency work should cease							
-43° & below	-45° & below	Non-emergency work should cease									

Source: American Conference of Governmental Industrial Hygienists, Inc. (ACIGH) 1999.

Notes:

1. *The schedule applies to any 4-hour work period with moderate to heavy work activity, with warm-up periods of 10 minutes in a warm location, and with an extended break (e.g. lunch) at the end of the 4-hour work period in a warm location. For Light-to-Moderate Work (limited physical movement): apply the schedule one step lower. For example, at –35oC with no noticeable wind, a worker at a job with little physical movement should have a maximum work period of 40 minutes with 4 breaks in a 4-hour period because they generate less body heat when they are less active and therefore, will get colder sooner.*
2. *The following is suggested as a guide for estimating winds velocity if accurate information is not available: 8 kph: light flag moves; 16 kph: light flag fully extended; 24 kph: raises newspaper sheet; 32 kph: blowing and drifting snow.*
3. *If only the wind chill cooling rate is available, a rough rule of thumb for applying it rather than the temperature and wind velocity factors given above would be*
   a) *special warm-up breaks should be initiated at a wind chill of about 1750 W/m2, and*
   b) *all non-emergency work should cease at or before a wind chill of 2250 W/m2. Wind chill cooling rate is defined as heat loss from a body expressed in watts per meter squared which is a function of the air temperature and wind velocity upon the exposed body.*

In general, the warm-up schedule provided above slightly under-compensates for the wind at the warmer temperatures, assuming acclimatization and clothing are appropriate for winter work. On the other hand, the chart slightly over-compensates for the actual temperatures in the colder range because windy conditions rarely prevail at extremely low temperatures.

The following table presents a minimum recommended schedule of maximum cold weather work periods that must be followed by a rest period. The table takes into account the combination of wind and temperature, and applies to moderate to heavy work activity. The notes on the page after the table explain how to adjust its recommendations for lighter work activity.

Threshold Limit Values for Work and Warm-up Schedule for 4 Hour Shift

These TLV's apply only for workers in dry clothing.

Special Precautions

Exposure to vibration may increase a worker's susceptibility to cold injury because of the way that vibration can reduce circulation, particularly in the extremities.

Work performed in snow or ice-covered terrain may require tinted safety eyewear with side shields for protection from glare.

Workers with health conditions that affect normal body temperature regulation or impair

circulation e.g. Raynaud's syndrome, diabetes, thrombophlebitis, etc. should take appropriate precautions when working in the cold.

Body parts that have sustained a frostbite injury are sensitive to re-injury. Workers should be aware of this and limit opportunities for re-injury.

If loose or bulky clothing is worn, special care should be taken when working around moving equipment or machinery to prevent clothing entrapment.

Section 9.0 – Appendix “H”

WHMIS (Workplace Hazardous Materials Information System)

Appendix "H": WHMIS (Workplace Hazardous Materials Information System)

The Workplace Hazardous Materials Information System (WHMIS) is a Canada-wide Hazard Communication System that deals with the most basic aspects of health and safety at worksites where chemicals are handled. It is fundamental "right to know" legislation. It enables anyone at a worksite to become knowledgeable about the hazards of the chemicals they handle or are potentially exposed to. Information about hazardous materials or "controlled products" will be provided in two forms:

- Labels or placards on the product containers, and
- Material Safety Data Sheets (MSDS).

Suppliers of controlled hazardous products and employers are both responsible for providing information of the controlled hazardous products and material.

Roles/Responsibilities

Supplier Responsibilities

- Appropriate labeling hazardous materials supplied to the workplace, and
- Preparation of the applicable MSDS.

Employer Responsibilities

- Must make the information available to all workers and ensure that a hazardous substance inventory is maintained for the regulated hazardous materials encountered on the worksite.
- Employers must have a corresponding current MSDS located for easy access by all employees. MSDS expire after three years and must therefore be renewed at the three year point or, the manufacturer can supply written confirmation that since no changes to the product/MSDS have occurred, the life of the existing MSDS is extended by attachment of the written notice.
- Employers must ensure all personnel that would potentially handle or be exposed to controlled products receive adequate training in Workplace Hazardous Materials Information System (WHMIS) and this training is current.

Worker Responsibilities

- Hazardous products are labeled with supplier labels and/or appropriate worksite labels or other required identification;
- Comply with corresponding current MSDS requirements; and
- Are handled and stored in accordance with Company and legislated requirements.

Labels

- All products shall meet the following label requirements:
- Controlled products, chemicals and other hazardous materials, which have been brought to the workplace, must have a “Supplier Label” attached. If no label is attached or exists, the product should not be accepted, and returned with the carrier;
- The supplier label identifies the product and provides basic hazard information and hazard prevention measures;
- Symbols and written material are used on the labels so that you can immediately recognize the associated hazards;
- Controlled products manufactured at the worksite are to be labeled with “Worksite Labels or placards”. These include controlled products from outside whose original supplier labels may have been damaged, bulk containers of controlled products, and products that have been decanted;
- The worksite label identifies the product and includes basic information on its safe use, handling, storage, and disposal and refers the user to the Materials Safety Data Sheet (MSDS);
- The Hazard Symbol Chart below describe all symbols and classifications to help you prepare a worksite label; and
- For information on the symbols that do or do not apply, consult the respective MSDS. Only those symbols that do apply should be identified on the worksite label.

WHMIS Hazard Symbols

Symbol	Description
	**A:** Compressed Gas (Oxygen, acetylene, Propane, aerosol spray cans, etc.)
	**Class B:** Flammable and Combustible Materials
	**Class C** - Oxidizing Materials that can emit Oxygen and thereby help other materials burn

<u>Class D: Poisonous and Infectious Materials</u>

	**D1 -** Materials causing immediate and serious toxic effects
	**D2 -** Materials causing other toxic effects that cause long-term eye/skin irritations
	**D3 -** Bio-hazardous infectious materials (Live bacteria or viruses)
	**Class E** - Corrosive materials that cause burns through the skin or eyes, or by inhalation
	**Class F** - Dangerously reactive materials that can burn or explode if exposed to excessive heat, shock, or mixed with other chemical products.

Material Safety Data Sheets

MSDS provide detailed information on controlled products. MSDS must be made available at the field office/worksite for all controlled products that you will come in contact with. If you find that a MSDS is not available, contact your supplier immediately; they are responsible for providing you with a current MSDS for the product. WHMIS requires a current MSDS to be supplied by the manufacturer of the product. MSDS have a shelf life of three years.

The nine essential sections of a MSDS are as follows:

1. Product Identification and Use: This includes the manufacturer and supplier's name, address and telephone number, the product identifier, and product use. A distributor buying a controlled product for resale does not have its own identification on the MSDS.
2. Hazardous Ingredients: This provides a list of chemical identifications of all controlled products and their concentrations. Where a concentration is expressed as a percentage, it is generally by weight.
3. Physical Data: This includes the physical properties of the controlled product such as odor, density, boiling point, melting point, etc.
4. Fire or Explosion Hazard: This provides information such as the flammability limit, upper and lower explosive limits, and means of extinction.
5. Reactivity Data: This includes the conditions under which the material is unstable, the names of the substances that the product is incompatible with, and the hazardous decomposition products.
6. Toxicological Properties: This provides information on the possible health effects of the product from acute or chronic exposure, exposure limits, and names of toxicologically synergistic products.
7. Preventive Measures: This provides the required personal protective equipment (PPE), specific engineering controls, emergency procedures, waste disposal, and storage and shipping requirements.
8. First Aid Measures: This includes specific first aid measures for workers.
9. Preparation Information: This provides the name and telephone number of the group preparing the MSDS and the date of preparation.

Waste Management

For the identification, classification, handling and disposal of waste potentially generated during the Lower Churchill Project, please refer to the LCP Waste Management Plan which is part of the overall LCP Environmental Management Plan.

Transportation of Dangerous Goods (TDG)

Dangerous goods include potentially hazardous materials such as explosives, compressed and liquefied gases, flammable liquids and solids, oxidizing materials, and other substances that are poisonous, infectious, radioactive or corrosive. The Transportation of Dangerous Goods Act (TDG) exists to protect people, the environment, or property when goods are being transported by road, rail, sea or air. Shippers, carriers and receivers are all responsible for ensuring that shipments of dangerous goods comply with federal, territorial, provincial and municipal laws. Payments of any fines assessed are the responsibility of those failing to comply.

Responsibilities of the Consignor

The consignor (the shipper) must ensure that in accordance with TDG Regulations the goods are:

- Classified
- Packaged
- Marked
- Labeled
- Documented
- The consignor must provide to the carriers a copy of the shipping document and placards, if necessary. Consignors must also report any dangerous occurrences in accordance with the regulations.

Responsibilities of the Carrier

Carriers must follow all applicable TDG and other legal requirements. They are responsible for:

- Checking the shipment before accepting it;
- Checking the documentation for accuracy;
- Mounting placards;

- Maintaining or replacing safety marks, labels, and placards, if necessary;
- Ensuring that the driver has in their possession a current TDG certificate;
- Ensuring proper shipping documents as outlined in the regulations are in the vehicle including MSDSs;
- Delivering shipping documents as outlined in the regulations; and
- Reporting any dangerous occurrences that happen during transport.
- Transport vehicle has provisions for containing and cleaning any minor spills that may occur and the driver has been trained to carry out the task as required

Note: TDG Certificates are required to be renewed every three (3) years.

Transportation of Dangerous Goods Classifications

Class 1: Explosives

 1.1 Major Explosion	 1.2 Major Projection	 1.3 Major Fire
 1.4 Localized Explosion	 1.5 Insensitive Mass Explosion	 1.6 Extremely Insensitive

Class 2: Gases

 2.1 Flammable Gas	 2.2 Non-Flammable, Non-Toxic Gas	 2.3 Toxic Gas	 Oxidizing Gas

Class 4: Flammable Substances

 4.1 Flammable Solid	 4.2 Spontaneously Combustible	 4.3 Dangerous When Wet

Class 5: Oxidizers / Organic Peroxides

 5.1 Oxidizer	 5.2 Organic Peroxides

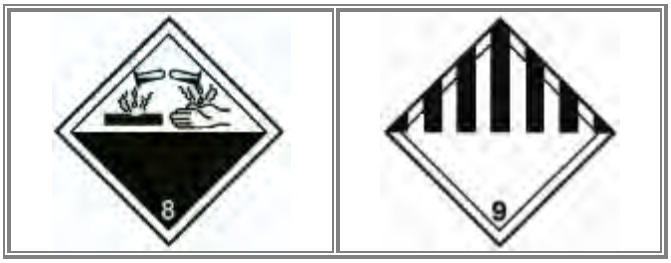
Class 6: Toxic / Infectious Substances

 6.1 Toxic	 6.2 Infectious (Label)	 6.2 Infectious (Placard)

Class 7: Radioactive

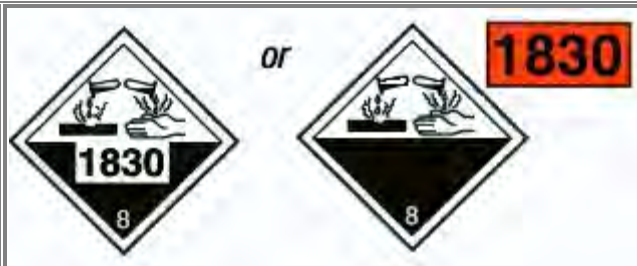
 (Labels or Placards)	 (Labels or Placards)	 (Labels or Placards)	 (Placard Only)

Class 8: Corrosives Class 9: Miscellaneous



UN Number, Packing Groups, Mixed Load

UN Number (Label)



UN Number (Placard)

Packing Groups

I Great Danger
II Moderate Danger
III Minor Danger

Mixed Load (Placard)

Section 9.0 – Appendix "I"

Transportation

Appendix "I": Transportation

Aircraft Safety – Helicopters/Fixed Wing Aircraft

During the course of the Lower Churchill Project, workers may be required to use helicopters to access remote areas to undertake fieldwork or use charter fixed wing aircraft to access areas when commercially scheduled flights are not available. During new hire orientation sessions, aircraft safety requires discussion by a competent individual. All personnel that are required to fly are aware of safety practices/procedures. The following will serve to acquaint workers with the general procedures governing passenger conduct working in and around helicopters and fixed wing aircraft.

Pre-Flight Information

- Prior to boarding the aircraft, all passengers will participate in the safety orientation conducted by the pilot will conduct. A safety orientation will be conducted whenever a new passenger joins the flight or the aircraft type changes.
- Pilot will provide instructions on operating latches, stowage of gear and prohibited items, location of emergency equipment and survival equipment in that model of aircraft as well as how and when to approach or disembark the aircraft.
- Pilot will identify the location of the survival kit. Confirm the kit is adequate to support the number of people in the aircraft.
- Pilot will advise the emergency landing posture for the aircraft type that is to be used that day.
- All passengers will advise the pilot it is their first flying experience or if they have any personal concerns.
- All passengers must dress accordingly; consider the environment and the weather conditions that might be encountered.
- Advise the pilot of the equipment and hazardous goods that you are going to bring on the aircraft.
- Carry, on your person, a reserve of any special medication you require, as delays may occur.

Embarking and Disembarking – General Aircraft

- Passengers shall approach, board or leave the aircraft only when directed to do so by the pilot or qualified ground crew member.

- Passengers shall obey all instructions given by the pilot.
- Use hearing protection devices provided.
- Conversation with the pilot should be restricted during the take-off and landing phases of the flight, as should intercom discussions among passengers.
- Smoking is prohibited within 10 meters of the landing pad, aircraft maneuvering or parking areas.

Embarking and Disembarking – Helicopter

- It is preferred that the helicopter be shut down for loading and unloading passengers; in the event this is not possible, passengers shall approach, board or leave a helicopter only when signaled to do so by the pilot.
- Eye protection will be worn while boarding and leaving a helicopter that is not shutdown.
- Passengers shall approach and leave the helicopter within the pilot's field of view and walk in a crouched position while under the main rotor.
- Passengers shall only approach a helicopter, in uneven terrain, by moving up-slope or disembark by moving down-slope.
- Passengers shall not walk behind the rear doors of the helicopter cabin.
- Passengers shall not carry any objects to or from the helicopter above shoulder height.
- Hardhats, baseball caps or other headgear shall be carried to and from the helicopter or be equipped with chin straps for use near helicopters.
- Passengers will leave the helicopter and move away during refueling.
- During arrival and departure of helicopters, stay off the landing pad to avoid exposure to flying particles and secure all equipment within the down wash zone of the landing pad.

Vessel Operations

LCP, Contractor and subcontractor workers may be involved in boat operations during the course of the Lower Churchill Project. All workers shall wear a Canadian Coast Guard approved personal floatation device when traveling by boat and when working over water where there are no handrails or lifelines. Specific site conditions will be assessed for hazards using the appropriate risk assessment tool (JSA, LMRA etc.) and additional procedures be developed and implemented as needed.

Before boarding any sea going vessel, personnel working on the vessel must be trained in:

- Survival at sea
- Aircraft rescue at sea
- Cold weather and arctic survival

General Vehicle Safety

It is imperative for workers to exercise a high level of safety responsibility when operating a vehicle either on or off the highway or on any of the sites of the Lower Churchill Project.

All drivers will:

- Possess a valid driver's license.
- Drive at or below posted speed limits.
- Use a vehicle suitable for the conditions expected.
- Will make them-selves familiar with the vehicle jacking tools, emergency equipment and ensure the vehicle has a serviceable spare tire.
- Prior to getting into a vehicle, walk around the vehicle to check for obstacles or hazards.
- Wear a seat belt at all times when the vehicle is in motion. When travelling on frozen lakes or rivers the use of seat belts is not mandatory. Vehicle speed must be appropriate for the ice conditions.
- Be responsible for passenger safety. All passengers shall wear seat belts at all times when the vehicle is in motion and it is the responsibility of the driver to ensure such.
- Drivers may acknowledge an in-coming call on a two-way radio and will immediately park in a safe location to continue the conversation. Drivers must park in a safe location to retrieve messages or initiate calls.
- Conduct a "Walk Around" Vehicle inspection prior to operating the vehicle each day.
- Comply with traffic laws when operating the vehicle.
- Obey all flag persons, posted signs and warnings when driving on public roads, private roads, property, sites or plants.
- Weather conditions permitting, turn off the engine and set the parking brake when the vehicle is left unattended.
- Turn off the engine when fuelling the vehicle. Check the oil level each time the vehicle is refueled.
- Report any incident involving the vehicle and/or injury immediately or as soon as reasonably possible to a Supervisor.

All-Terrain Vehicles and Snowmobiles

All-Terrain Vehicles have been increasingly used to undertake work in terrain where regular vehicles cannot operate. All ATV and snowmobile operators shall:

- Have a valid operator's license.
- Be competent in operating an ATV or snowmobile.
- Prior to using an ATV or snowmobile, walk around the unit and check for obstacles or hazards.
- Operate the ATV and snowmobile according to provincial or territorial regulations.
- Operate and maintain the ATV or snowmobile according to manufacturer recommendations.
- Wear the protective equipment specified in the provincial or territorial regulations and by the manufacturer.
- Inspect the ATV or snowmobile before each use.
- Use ramps to load and unload the ATV and snowmobiles from vehicles or trailers.

Heavy Equipment Hazard Zone

Workers must remain aware of the hazard zone that exists around heavy equipment:

- The work area (including turning radius) surrounding hoes, cranes and drills will be marked with barricade tape.
- Unauthorized workers will remain outside of the marked hazard zone.
- To ensure safety of personnel when loading and unloading materials or products from heavy equipment, “wheel chocks” must be used and the area flagged off.

Section 9.0 – Appendix "J"

Work Site Hazards (Wildlife Management)

Appendix "J": Work Site Hazards (Wildlife Management)

We live in harmony with most wildlife in Newfoundland and Labrador, often without even realizing it. Our forests and barrens are home to many animals. Unless we intentionally seek them out, some people can go a lifetime without being aware of their presence. As long as humans and wildlife respect each other's' boundaries, conflicts can be avoided – but we all have to do our part to make sure we don't encourage behavior that could cause problems for wildlife, such as Coyotes and Black Bears.

Identifying Coyotes

The Eastern Coyote belongs to the Canidae family, which also includes wolf, fox and dog. Like most animals, coyotes usually have a natural fear of people, but they also possess natural intelligence and can quickly get used to life in residential areas as long as they have easy access to food. Although attacks on humans are extremely rare, they can occur if a coyote becomes too comfortable around people and starts associating humans with food.

If a coyote enters your work site/area you should never approach a coyote, if a coyote approaches you take the following steps:

- Give it an escape route.
- Throw rocks, sticks or other objects at the coyote.
- If the coyote continues to approach, back away slowly and move toward buildings or human activity.
- Do not turn away or run. This will encourage the coyote to chase you.

Identifying Black Bears

Black Bears are bulky animal with a moderate-sized head; a tapered, brownish muzzle and long nostrils; rounded ears; small eyes; and a short tail. Coat is usually black, sometimes with a white patch on the throat or chest. Feet are furry with five curved, non-retractable claws. Similar to the coyote, black bears usually have a natural fear of people, but they can quickly get used to life in residential areas as long as they have easy access to food. Although attacks on humans are extremely rare, they can occur if a black bear becomes too comfortable around people and starts associating humans with food.

Little can be done to manage habituated bears. Avoid creating problem bears by making sure food, trash and other attractants are stored properly. Although black bears are usually timid and attacks are extremely rare, they are wild animals and can be dangerous.

If a black bear enters your work site/area takes the following steps;

- Stay calm.
- Use “Bear Bangers” or similar noise makers
- Give the bear space and an escape route.
- Speak calmly and firmly, avoid eye contact, and back away slowly
- Never run or try to climb a tree.
- If the bear begins to follow you, drop something (not food) to distract it.
- Be cautious around females with cubs.
- If the bear attacks you, fight back and make a lot of noise. Do not "play dead."

Polar Bears

Although Polar bear encounters in Newfoundland and Labrador are rare, they have been sited in both areas over the last few years. Polar bears are among the largest carnivores in the world. They are strong, fast and agile on ice, land, as well as in water. The best way to be safe is to avoid them completely at all times.

Polar Bear live mainly on sea ice or on land within a few kilometers of the coast. In summer, polar bears often travel along coastlines using points of land and rocky islets near the coast to navigate. They also travel inland and have been seen as far as 150 kilometers from the coast.

To best avoid encounters with all bears, it is always important to stay alert. It is recommended that in remote areas to always travel in groups of at least four people and stay together to increase safety. Creating noise while walking through remote areas will communicate your presence. It is important travel in daylight and be aware of your surroundings. Polar bears may be hard to see. Avoid areas of restricted visibility, pushed up sea ice, boulders, driftwood or vegetation. Watch for tracks, droppings and diggings.

Never approach a bear. Polar bears defend their space and may consider you a threat. Never feed bears or other wildlife. A bear that associates humans with food is dangerous. Never approach a wildlife carcass. A bear may be in the area. Leave immediately.

It is possible to have an encounter with a polar bear by chance or because it is attracted to your activity. Polar bears are curious and may investigate any strange object, smell or noise. Always stay calm and assess the situation. Each encounter with a polar bear and bears generally is unique. Good judgment, common sense and familiarity with bear behaviour are important.

- Curious Bears - If a bear knows you are there and shows signs of being curious such as moving slowly with frequent stops, standing on hind legs and sniffing the air, holding its

head high with ears forward or to the side, moving its head from side to side, or trying to catch your scent by circling downwind and approaching from behind, do not run. Back away slowly. Help the bear identify you as human by talking in low tones. Move slowly upwind of the bear so that it can get your scent. Always leave an escape route for the bear. Do not run.

- Defensive Bears - If a bear has been surprised at close range or shows signs of being agitated or threatened such as huffing, panting, hissing, growling, jaw-snapping, stomping its feet, staring directly at a person, or lowering its head with ears laid back, do not run. Back away slowly. Do not shout or make sudden movements. Avoid direct eye contact. Act non-threatening. Be prepared to use deterrents. Do not run.
- Predatory Bears - If a bear shows signs of stalking or hunting you such as following or circling you, approaching directly, intently and unafraid, returning after being scared away, or appears wounded, old or thin, do not run. Group together and make loud noises. Be prepared to use deterrents. Be prepared to fight back. Do not run.
- Bears With Cubs - Never get between a bear and her cubs. If you come across a bear with cubs, do not run. Group together and leave the area immediately. Be prepared to fight back if she attacks.

If you experience a polar bear attack use any available weapon such as rocks, blocks of ice, knives, skis or poles.

Section 9.0 – Appendix “K”

Workplace Security

Appendix "K": Workplace Security

To address instances where security could be compromised (unauthorized access) at the construction site security practices must be properly implemented. Access to and from construction site locations will be restricted to authorized personnel only and that have a proper site orientation. Temporary vehicle gates will be installed at entrance points to the construction site location and controlled by security personnel.

The following security measures and precautions will be taken during the course of the project:

- The Site Security Provider will be responsible for placement of the security workers during and after work hours as and when warranted.
- All authorized visitors must sign in and out. All visitors must meet training requirements.
- Control of equipment and materials entering and leaving the site will be strictly monitored.
- Any hazardous wildlife sightings, security issues and incidents must be reported immediately to the designated LCP Site Environmental Advisor designated representative.

Any illegal conduct by personnel on the construction site is grounds for immediate removal and subject to be turned over to local RCMP.

Section 9.0 – Appendix "L"

Nalcor Corporate Safety and Health Standards

Appendix "L": Nalcor Corporate Safety and Health Standards

The following is the most current list of Nalcor Corporate Safety and Health Standards:*

4.4.3.2.2	**Internal Safety and Health Communications**
4.4.6	**Electronic Device Use Standard**
4.4.6.1	**Contractor Safety Management**
4.4.6.11	**Energized Power Line Hazards Permits**
4.4.6.12	**Work Methods**
4.4.6.2	**Confined Space**
4.4.6.3	**Electrical Safety Program**
4.4.6.3.1	**New Worker Hard Hat Program**
4.5.1.1	**Data Trending and Analysis**
4.5.3.1	**Incident Investigation and Reporting**

* *A number of the Corporate Health and Safety Standards are undergoing approval process at the current time*.

Section 9.0 – Appendix “M”

Electrical Safety

Appendix "M": Electrical Safety

General:

Only a worker qualified to work on electrical conductors and equipment shall be authorized to do the work. (OH&S Regulations, Section 478 (2))

Approved live line techniques as determined through a formal risk assessment shall be utilized when performing such work. OH&S Regulations 478 (3)

The supervisor shall appraise the work and decide whether it can be done safely. If in doubt, he/she shall refer the job to the next level of supervision.

No other work shall be done on a pole or structure upon which live line work is in progress. This rule also applies to the pole or structure on either side of the pole being "worked on".

If possible, work on energized lines or apparatus should be done from below.

When it is necessary for one worker to change his/her working position on a pole or tower, other workers shall not do any work on energized conductors until the worker changing position has reached his/her new position.

Workers doing live work shall devote their undivided attention to the work at hand. Unnecessary conversation shall be avoided.

Neutral wires carried horizontally on the side of the pole below energized conductors shall be removed from the pole or covered with protective cover-up devices before work on the energized conductors is begun.

Neutral circuits shall never be open. Before a job is started, exposed vertical ground wire on wood pole structures within the work area shall be removed or covered with protective cover-up devices. Extreme care shall be exercised to prevent gaffing of protective cover-up devices.

Minimum Approach Distances:

Workers shall maintain a Working Minimum Approach Distance from all Energized parts when working on or near energized Conductors. Working Minimum Approach Distance (MAD) formerly Working Limits of Approach (Qualified Persons) is defined as the shortest distance allowable between energized live conductors and any part of a worker's body, material, or tool the worker is handling.

Live Line Techniques are required for any approach to energized conductors that is closer than the distance specified in the Working Minimum Approach Distance table. Under no circumstances shall the worker's body, material, or tool the worker is handling come closer to the energized conductor then the distance specified in the Minimum Air Insulation Distance (MAID) formerly Absolute Limit of Approach (Qualified Persons) table, unless an Approved direct contact technique is being utilized.

Nalcor Energy Minimum Approach Distance

Nominal Operating Voltage		Minimum Air Insulation Distance- MAID		Minimum Approach Distance- MAD	
phase to phase	phase to ground	mm	m	mm	m
4.16 kV	2.4 kV	140	0.14	750	0.75
12.47 kV	7.2 kV	140	0.14	750	0.75
13.8 kV	7.96 kV	140	0.14	750	0.75
29.94 kV	14.4 kV	290	0.29	900	0.90
33 kV	19.05 kV	390	0.39	1000	1.00
34.5 kV	19.92 kV	390	0.39	1000	1.00
46 kV	26.56 kV	490	0.49	1100	1.10
66 kV	38.105 kV	600	0.60	900	0.90
69 kV	39.837 kV	600	0.60	900	0.90
138 kV	79.674 kV	900	0.90	1200	1.20
230 kV	132.79 kV	1400	1.40	1700	1.70
735 kV	424.35 kV	5400	5.40	5700	5.70

There is no Minimum Air Insulation Distance at these voltages when working directly on Primary Voltage Circuits using rubber gloves or other approved direct contact techniques. Unless working under the close supervision of a Qualified Person, unqualified persons shall not be allowed to approach exposed energized electrical lines or apparatus any closer than the distance specified below.

Contractors (unqualified persons) are expected to comply with the limits of approach as outlined in the OHS Regulations. The work of contractors must be stipulated in the respective electrical safety programs.

Minimum Approach Distance (Unqualified Persons)

Nominal Circuit Voltages (phase to phase)	CSA Voltage Range (phase to ground)	Minimum Clearance (meters)
0.75 kV – 25 kV	0.4 – 22kV	3.0
-69 kV	22 - 50 kV	3.0
-138 kV	50 – 90 kV	4.0
-230 kV	120 – 150 kV	4.6
-345 kV	190 – 220 kV	5.2
-735kV	220 - 345 kV	6.7

Live Line Tools:

All Live Line work should be planned and carried out to facilitate removal of live line tools and protective cover-up devices at the end of the workday. Hot sticks and protective cover-up devices are all-susceptible to tracking and corona damage if left on the line for long periods, especially in inclement weather. Whenever possible, the hanging of live line tools on Conductors should be avoided.

Live line tools should not be used in rain, high winds, fog, or snow. In an emergency where fuse cutouts and/or disconnects must be operated, extra precautions shall be exercised such as the: wearing of rubber gloves; use of rain guards on the stick; and application of silicone to the stick immediately prior to use.

When using live line tools, workers shall not place their hands closer to the energized metal parts of the tools than that recommended below:

Normal Circuit Voltage	Minimum Voltage and Clear Stick Distance (meters)
0.75 – 25 kV	0.7
46 kV	0.8
69 kV	0.9
138 kV	1.1
230 kV	1.5
345 kV	2.1
735 kV	4.6

- Except as necessary to secure or release them, hold out ropes or live line tools being used to spread or raise conductors shall be securely fastened and workers shall not hold them.

  - The responsibility for seeing that live line tools are frequently inspected, tested and cleaned shall rest with the Supervisor.

- Live line tools such as grip-all sticks, switch sticks, and tools used in the everyday operations shall be dielectrically tested yearly or anytime they become suspect.

- Live line tools such as wire tongs, tie sticks, link sticks, strain sticks, and tools used exclusively for live line maintenance and generally transported in a proper trailer or carrier shall be dielectrically tested every three (3) years or anytime they become suspect.

- Live line tools showing any leakage shall not be used and shall be tagged with a Defective Tool or Equipment Tag and taken out of service.

- Fiber ropes and slings, used in conjunction with live line maintenance, shall be considered live line tools. Their care and storage shall receive the same attention as other live line tools.

Storage:
All live line tools not being regularly transported should be stored in a dry location and should not be tampered with or handled by un-authorized persons. Live line tools shall be kept free from dirt and moisture, and under no circumstances shall any live line tools be laid directly on the ground.

Transportation:
Live line tools should be transported and remain in the special portable containers designed for their transportation in a manner which prevents mechanical damage and provides protection from the weather.

Servicing:
Live line tools in unsafe condition and requiring treatment or repairs shall be tagged with a Defective Tool or Equipment Tag and exchanged for a tool in good condition. Un-authorized persons shall undertake no repairs.

Protective Rubber Gloves:

Workers shall not touch or work on any exposed energized lines or apparatus except when wearing personal protective equipment approved for the voltage to be contacted.

.

Rubber gloves are not to be worn while climbing structures due to the risk of accidental punctures from wood splinters and other sharp pole hardware. However, rubber gloves shall be put on before entering the Minimum Approach Distance to energized lines or equipment and shall not be removed until the worker is completely out of the Minimum Approach Distance zone.

.

Only approved insulating gloves shall be used. Insulating gloves shall never be worn inside out or without leather protectors. They shall be exchanged any time they become damaged or if the worker to whom they are assigned has reason to doubt their condition. Leather protectors or over gloves shall not be worn except when in use over insulating gloves. When not in use, insulating gloves shall be stored in an approved canvas bag, in a cool dry place, away from high voltage equipment, and never stored inside out.

Insulating gloves shall be inspected for cracks or other damage and shall be given the roll and air test before each use.

Class 0 insulating gloves shall be worn on lines or equipment energized at 50 volts AC or 120 volts DC up to 750 volts AC/DC or when deemed necessary by the Supervisor.

Where the use of Class 0 gloves reduces the dexterity such that a greater hazard is created the work may be performed with insulated tools or equipment only. For example, working on protection and control circuitry behind a substation protection panel requires fine motor skills in a confined area. As such, in this case, the work may be performed without rubber gloves PROVIDED that the worker is using properly rated insulated tools and equipment.

Note: This exception does not apply to work involving aerial service conductors, street lighting, meter removal and other similar activities. In these cases, rubber gloves are mandatory, unless the line or piece of equipment has been confirmed to be de-energized and grounded.

Cover-up Devices:

Protective cover-up devices shall be used on primary voltage conductors, low voltage conductors, telephone circuits, and other wires which are immediately above, below or

adjacent to the work area. Except for the part of the conductor which is being worked upon, when work is to be done on or near energized lines all energized and effectively grounded conductors or guy wires within reach of any part of the body while working shall have protective cover-up devices applied.

Line hose, hoods, blankets, line guards, etc., shall be visually inspected before each job. In applying protective cover-up devices, workers shall always protect the nearest and lowest wires first. In removing protective cover-up devices, the reverse order shall be maintained. When possible, protective cover-up devices shall be applied from a position underneath the conductor.

Rubber blankets and other protective cover-up devices shall not be placed on the ground without first protecting them from physical damage and moisture by means of a tarpaulin, canvas, or protective mat. To avoid corona and ozone damage, protective cover-up devices shall not be allowed to remain in place on energized lines or apparatus for long periods, nor stored in close proximity of energized equipment.

When not in use, protective cover-up devices shall be protected from mechanical and chemical damage, and shall always be stored in the containers provided or in special compartments on trucks. Nothing else shall be stored in these containers or compartments.

Arc Flash:

Arc Flash is a serious type of electrical explosion that can cause considerable property damage, personal injury, and even death. Any worker who is assigned to work or switch exposed energized equipment rated at 600 volts or above, shall wear the appropriate Personal Protective Equipment as prescribed in the charts below as a minimum.

For more information, please refer to Nalcor Corporate Health and Safety Standard 4.4.6.

Section 9.0 – Appendix "N"

Nalcor Corporate Safety and Health Programs

Appendix "N": Nalcor Corporate Safety and Health Programs

The following is the most current list of Nalcor Safety and Health Programs

- **Hazard Recognition, Evaluation and Control and TBRA Information**-Hazard recognition, evaluation and control is a thorough examination of an operation (workplace) for the purpose of identifying what actual and potential hazards exist, evaluation the level of risk in each exposure and making decisions about the effectiveness of new and existing controls. Hazard recognition, evaluation and control are also a major part of the task based risk assessment process.

- **Burning and Welding-** Due to the inherent hazards associated with the use of portable gas or electric arc equipment, burning and welding in any location not specifically designed for such activity is a high risk task. Areas specifically approved for burning and welding are enclosed by non-combustible walls, partitions or spark-tight curtains with non-combustible floors, ceilings and contents.

- **Corporate Fall Protection Program** Nalcor Energy (Nalcor) is committed to providing a safe work environment for its employees and preventing occupational injuries due to falls. Fall Protection is an integral part of our commitment to a safe work environment. Any time a worker is exposed to a fall hazard there will be a procedure and equipment to reduce and/or eliminate the hazard of working at height. Fall Protection shall be achieved through a hierarchy of controls that will involve all levels of management, supervisory and field personnel. This hierarchy shall be: elimination of hazards through engineering (design) and procedural practices; control and mitigation of hazards through passive fall protection; travel restraint systems; the use of fall arrest systems; and finally the use of administrative controls. Supervisors and workers shall be expected to assess the risks associated with a task and ensure that proper mitigation is in place to protect them while climbing and working at heights. Where a worker is unsure of the methods, equipment or procedures to reduce the risk they are to seek direction from their supervisor.

- **Disability Management Policy Statement** - Nalcor Energy is committed to assisting employees who have been injured on the job to return to work in a timely and safe manner through early intervention and active case management. To fulfill this commitment Nalcor Energy has established a Disability Management Program with a primary focus of providing injured employees a timely return to suitable and meaningful employment consistent with their functional abilities and competencies. The Disability Management Program process, as outlined in the Leadership Element of the Corporate Occupational Health and Safety Management System is consistent with the requirements of Sections 89 and 89.1 of the Workplace Health, Safety and Compensation (WHSC) Act and applicable policies of the WHSC Commission including the requirement to maintain active communication with

injured employees, to protect the confidentiality of personal information, and to make every effort to accommodate injured employees per the Re-employment Obligations and Duty to Accommodate provisions of the WHSC Commission Policy RE-18. All stakeholders, whether they be management, union leadership, or employees, are responsible for actively developing, participating and cooperating in the disability management process

- **Incident Investigation** - Incident investigation processes are used to gather accurate information about, and analysis of, safety incidents, including "near misses", to determine the contributing factors to help minimize the risk of recurrence, identify key prevention initiatives, and generate lessons learned. This is documented and communicated internally though the Corporate SafeWorkplace Observation Program (SWOP). While this database specifically addresses safety incidents, SWOP is also utilized to document and track incidents and/or loses related to the environment and property. Employees are required to report all safety incidents, including near misses, to ensure that appropriate preventative measures can be implemented to minimize risks, prevent recurrence and for continual improvement of the safety management system. Refer to Nalcor Corporate Health and Safety Standard 4.5.3.1

- **Noise Level Surveys and Hearing Conservation** - Nalcor Energy shall inform its employees of excessive noise levels in the workplace and provide working conditions and protective equipment to reduce the levels of exposure to those established by the Occupational Health and Safety Act & Regulations.

- **Personal Protective Equipment** - Nalcor Energy requires all employees and contractors wear approved Personal Protective Equipment (PPE) while working in designated work areas and while performing tasks where the use of PPE is compulsory.

- **Safety Footwear and Protective Clothing Allowance** Nalcor Energy will provide financial assistance to employees who, by the nature of their work, are required to purchase PPE, safety footwear and/or protective clothing. Employees covered by a Collective Agreement should refer to the appropriate clause in their Agreement.

Section 9.0 – Appendix "O"

Nalcor Health and Safety Field Inspection Checklist

Appendix "O": Nalcor Health and Safety Field Inspection Checklist

General Information and Directions

The purpose of the H&S Field Inspection Checklist is to provide reference and record for conducting a site/field inspection.

When conducting an inspection of a specific field, use the list of items under each heading as a guide to identify areas of potential hazards or areas which need to be addressed.

Assure that all deficiencies, items marked "Not Acceptable", are actioned via the Safe Workplace Inspection/Tour section of SWOP. Take note of the item and its corresponding SWOP observation reference number in the table provided.

For further information regarding HSE inspections, please refer to MSD-HS-011 Lower Churchill Project – HSE Inspection Guidelines.

Specific Field Input Directions

Place a checkmark in the box for each item which applies to the inspection (Acceptable, Not Acceptable, Not Applicable).

Any items which have been identified as "Not Acceptable" require corrective action and a SWOP card must be completed for each. Note the item and its corresponding SWOP card reference number in the table provided on the form.

Return the completed inspection form to the LCP-HSE Department along with any SWOP cards which may have been completed by hand. SWOP cards may also be submitted electronically

Guidelines for Use

Introduction

The purpose of the H&S Field Inspection Checklist is to provide reference and record for conducting a site/field inspection.

Using the Checklist

When conducting an inspection of a specific site/field, use the list of items under each heading as a guide to identify areas of potential hazards or areas which need to be addressed.

Assure that all deficiencies, items marked “Not Acceptable”, are actioned via the Safe Workplace Inspection/Tour section of SWOP. Take note of the item and its corresponding SWOP observation reference number in the table provided.

For further information regarding HSE inspections, please refer to MSD-HS-011 Lower Churchill Project – HSE Inspection Guidelines

Item	Accept	Not Accept	N/A
SITE GENERAL			
Lighting levels adequate for tasks performed.			
All light bulbs/tubes working and lighting covers adequately clean.			
General condition of walls, floors, floor coverings and ceilings good.			
Ventilation ducts clean and unobstructed.			
Staff/kitchen facilities provided away from work areas.			
Staff/kitchen facilities clean and tidy.			
HOUSEKEEPING			
Areas, accesses and landings free of obstructions/tripping hazards.			
Materials arranged/stored safely (including flammables).			
Tools orderly and clean. Unnecessary tools removed.			
Adequate disposal containers available/maintained.			
Adequate storage facilities provided.			
HYGIENE FACILITIES			
Toilets available and working.			
Cleanup facilities available.			
Areas clean and cleaning records maintained.			
FIRST AID			
Certified First Aider(s) identified and available.			
First aid station(s) available and appropriately equipped.			
Locations of first aid kits labeled and easily accessible.			
EMERGENCY RESPONSE			
Emergency exit routes identified and signed.			
Emergency exit lights operational.			
Emergency exit doors clear and easy to open.			
Required fire extinguishers up-to-date.			
Fire extinguishers identified by signs and 1 m clear area around.			
Evacuation maps displayed and up-to-date.			
Muster stations clearly marked.			
Emergency phones numbers displayed.			
Chief and emergency wardens identified and available.			

Item	Accept	Not Accept	N/A
Emergency alarms checked and tested.			
Emergency equipment available (eye wash, chemical spill kit).			
PERSONAL PROTECTIVE EQUIPMENT (PPE)			
Adequate PPE provided where necessary (gloves, hard hats, etc).			
PPE properly worn where necessary.			
PPE stored and maintained correctly.			
JOB SITE POSTING / SIGNAGE			
Contractor identification sign.			
Contractor safety program.			
OH&S Act and Regulations.			
H&S Representative (name, trade, employer).			
First Aid Certificate.			
Warning signs and barricades adequately posted.			
HAZARDOUS MATERIALS			
Up-to-date MSDS available (no more than 3 years old).			
MSDS available where chemicals are used.			
Containers appropriately labeled.			
Hazardous materials safely stored and/or segregated.			
ELECTRICAL HAZARDS			
All electrical equipment in good condition.			
Electrical equipment inspected and maintained.			
Power boards used. Not double adaptors and piggyback plugs.			
Leads secured and not potential trip hazards.			
Power tools grounded or double insulated (CSA approved).			
Ground fault circuit interrupters in place.			
Explosion-proof devices where required.			
Equipment locked-out for repair.			
Compliance with corporate work protection code.			
Temporary power supply properly identified.			
Overhead lines flagged and secured.			
HAND/POWER TOOLS AND EQUIPMENT			
Guards in place/functioning.			
Grinding discs – speed rating and condition.			
Appropriate retainers (sockets, chippers, etc.)			

Item	Accept	Not Accept	N/A
Tools/equipment in good condition.			
Defective equipment tagged as required.			
LADDERS, STAIRWELLS AND RAMPS			
No cracks or defects.			
Non-slip feet/bases.			
Correctly used and tied off.			
Non-metallic ladders used.			
Proper size and type.			
Proper handrail and landings.			
Proper filler blocks in metal stairs.			
Proper cleats on ramps.			
SCAFFOLDING			
Appropriately tagged and signed by installer.			
Footings properly supported and nailed.			
Top rail, mid rail and toe board in place.			
Properly erected.			
Proper access platform.			
Acceptable loading.			
Properly attached and capable of at least 4 times maximum load (suspended).			
Outrigger beam tied to fixed support with adequate counterweight (suspended)			
All mechanical/electrical devices in good condition (suspended).			
Independent lifelines for each worker (extend to ground) (suspended).			
SAFE WORK PRACTICES			
Personnel trained/qualified for the task.			
Permit to Work / Isolations / Lockouts used.			
Working and Height			
Safe Lifting Practices (Mechanical/Manual)			
Confined Space Entry procedures and testing.			
Precautions for work at high pressure in place.			
Hot/Cold Work			
Testing procedures.

TABLE OF CONTENTS

PAGE

1 INTRODUCTION

All key decisions made by the Lower Churchill Project team are risk-based. Package management is not an exclusion from this rule. Package risk management process adopted by the Project supports selection of Contractors and Suppliers in a way that allows reduce overall Project risk exposure. Same time, it promotes and supports development of effective Contractor's/ Supplier's risk management.

1.1 Purpose

To facilitate effective package risk management and put forward Risk Management Requirements for Bidders (Contract pre-award) and Contractors/ Suppliers (Contract post-award).

1.2 Scope

The scope of this document covers management of risks within the package scope both during the bidding process and after a Contract is awarded. It identifies general package Risk Management Requirements (Figure 1), namely, general guidelines to

- reply to the package Risk Questionnaire (pre-award),
- prepare package Risk Management Plan including package Risk Register (pre-award),
- update package Risk Management Plan (post-award),
- produce Monthly Risk Reporting (post-award).

Normally, a requirement to reply to the Risk Questionnaire is part of any package RFP. Whereas requirements to produce Risk Management Plan/ Risk Register or Monthly Risk Report (items A03 and A04 of SDRL) could be included to/ excluded from the package Risk Requirements. If included to the Requirements, the specific content of these documents will be stipulated by the package RFP (pre-award requirements) and the awarded Contract (post-award requirements) depending on the package scope, form / type of contract and package criticality.

If part of the package scope is to be actually performed on Contractor's/ Supplier's behalf by another parties, associated risks should be reflected in documents listed above.

1.3 Definitions

Bidder: any entity that responds to a package request for purchase (RFP) issued by SNC-Lavalin on behalf of Nalcor Energy.

Contractor: Any entity that is awarded a contract package to provide on-site construction and/or installation services to Nalcor Energy, with SNC-Lavalin acting as the Nalcor's representative for contract administration.

Fixed Price Contract: a form of contract when payment to deem to cover all costs, overheads and profits, wherein the Contractor/ Supplier includes all necessary contingencies for possible risks. Usually includes Liquidated Damages clauses for a case of Contract term's violations. This type of Contracts is characterised by higher Contractor's/ Supplier's risk exposure.

LCP: The Lower Churchill Project.

RAM: Risk Assessment Matrix is tool to measure deviations from package Contract objectives.

RBS: Risk Breakout Structure identifies sources of risks relevant to package delivery, may be based on package WBS and reflect technical, commercial, organizational, economic, etc. aspects.

Reimbursable Contract: a Contract when all costs incurred in the performance of the Contract are reimbursed and a fee is paid to cover profit and overheads. This type of contracts is characterised by higher Owner's risk exposure.

Risk: A risk is a future event that, if occurs, may cause deviations from the Contract.

Risk Management: The systematic application of management procedures and practices aimed at establishing the context for identifying, analyzing, evaluating, addressing, monitoring and reporting risks.

Risk Register: a log of package risks identified and managed by a Bidder or Contractor/ Supplier that includes risk descriptions, risk addressing actions, assessments of the risks before and after addressing, etc.

SLI: SNC-Lavalin Inc.

SDRL: Supplier Document Requirement List (document "Contractor Document Requirements"/ SLI # 505573-0000-37AG-I-0015). It includes the document requirements for either a Contractor or Supplier depending on a type of a package.

Supplier: Any entity that is awarded a Contract to provide equipment, materials or services to Nalcor Energy, with SNC-Lavalin acting as the Nalcor's representative for contract administration.

Unit Price Contract: a form of contract when payment to deem to cover fixed sum for each completed unit of work including all unit costs, overheads and profits as well as all necessary contingencies. This type of contracts usually used in case of construction packages is characterised by sharing of risks between the Owner and a Contractor/ Supplier. Namely, a Contractor/ Supplier bears the unit price risks, whereas the Owner covers risks associated with uncertainty about number of units.

2 RISK MANAGEMENT DELIVERABLES

This section contains general guidelines on preparing major package risk management deliverables. Specific requirements and content of the deliverables (e.g., list of risks that are subject to Monthly Risk Reporting, etc.) will be defined by corresponding sections of RFP and the Contract.

2.1 Risk Questionaire (Pre-award)

Risk Questionnaire contains a number of generic questions about Bidder's existing risk management system applicable to the proposed package Contract. In addition, some package related risk questions are included. They are based on risks preliminary identified by the Package Owner. The Risk Questionnaire is included to all package RFP's as a mandatory requirement. The Risk Questionnaire responses will be considered in the evaluation of Bidders.

2.2 Risk Management Plan (Pre-award & Post-award)

Depending on the package scope, form / type of contract and package criticality, package Risk Management Plan could be part of the Risk Requirements (SDRL item A04) both pre-award and post-award.

If included to the Requirements pre-award, the Risk Management Plan developed by a Bidder as part of the RFP response will be used for evaluation of Bidder's capability and should contain following items:

- Description of risk management process steps adopted by a Bidder for the contract scope of work / service (usually consists of risk identification, risk assessment "as-is" (before addressing), risk addressing, assessment "to-be" (after addressing), retirement and acceptance of risks)
- Description of organizational context of risk management (usually includes responsibilities of team members in the risk management process, types and frequencies of risk review meetings, risk reporting and communications including rules to prioritize risks, etc.)

- Description of tools used to support the risk management process (usually includes list of risk categories (e.g. Risk Breakdown Structure (RBS)), Risk Assessment Matrix (RAM) and Risk Register)

Figure 2 provides the Risk Assessment Matrix (RAM) recommended to Contractors/ Suppliers for LCP. (Specific descriptions of risk impacts could be amended in some cases to better reflect package scope, budget and schedule.)

Risk Management Plan pre-award should contain full package Risk Register developed by a Bidder as an appendix using RAM of Figure 2.

Upon award of a Contract, the initial Risk Management Plan should be reviewed with the Package Owner. The content of a Risk Management Plan post-award (including list of risks included to Risk Register) is a subject to the Contract's Coordination Procedure. Guidelines to prepare Risk Registers are described in section 2.3.

2.3 Risk Register (Pre-award & Post-award)

A Risk Register is a log of package risks identified, assessed and addressed by a Bidder or Contractor/ Supplier. If indicated in a particular RFP, the full Risk Register should be submitted by a Bidder with its accompanying Risk Management Plan as part of response to Request for Proposals and will be considered by SLI during the evaluation process.

Depending on the form/ type of contract, managing of and reporting on some of the package risks post-award would be delegated to Contractor/ Supplier and becomes part of the package scope. However, reporting on some risks could not be mandatory in terms of these Risk Requirements. Same time, Contractor/ Supplier is encouraged to manage corresponding risks as part of its internal risk management. The list of risks that become part of the Risk Register post-award and subject to Monthly Risk Reporting (section 2.4) should be agreed and reflected in the Contract's Coordination Procedure. Its content depends on form/ type of contract and normally includes only risks of Medium and High level.

In case of fixed price/ unit price types of Contracts of supply packages, only risks of Schedule and Quality impacts normally become subject to reporting by Contractor/ Supplier post-award. Although, in

case of fixed price/ unit price types of Contracts of on-site construction/ installation packages besides risks of Schedule and Quality impacts risks of Safety and Environment impacts become the subject to the Risk Requirements.

In case of reimbursable types of Contracts, Cost impacts become a subject to Risk Requirements for both supply and construction/ installation packages.

Managing risks of impacts on Reputation is optional in terms of these Risk Requirements for any types of contract. However, a Contractor/ Supplier could be interested in managing corresponding risks on its own by obvious reasons.

The approved list of package risks that become part of the Risk Register post-award and subject to Monthly Reporting (section 2.4) should be reflected in the Contract's Coordination Procedure.

Following items should be included to a Risk Register both pre-award and post-award for each selected risk (Figure 3):

- Risk Identification No.
- Risk title
- Risk definition (recommended is three part risk definition: cause(s) – risk event – impact(s))
- Comments (additional relevant notes and insights on risk definition and description)
- Risk status (it could be proposed, active, retired, accepted)
- Risk owner (a member of the Bidder's or Contractor's/ Supplier's team who is responsible for managing of a risk)
- Risk category (as part of Risk Breakdown Structure it could point to technical, commercial, organizational, economic, etc. types of risks)
- Assessment of probability of occurrence and impact(s) before addressing ("as-is") (according to the RAM)
- Response strategy (avoid, mitigate, transfer, accept)
- Addressing actions (particular steps to support selected addressing strategy including measures in place)
- Action status (it could be proposed, active, on-hold, completed, retired)

- Comments on progress of the addressing strategy and actions (is used in Monthly Reporting post-award)
- Assessment of probability of occurrence and impact(s) after addressing ("to-be") as if all the proposed addressing actions were already implemented (according to the RAM)

Note: As a general rule, representatives of SLI and/ or Nalcor Energy do not take part in risk identification and assessment sessions in case of fixed price and unit price types of Contracts, while in the case of reimbursable type of contract their participation would normally occur. Specific level of involvement of representatives of SLI and Nalcor Energy in risk identification and assessment sessions is to be stipulated by the Contract's Coordination Procedure.

Following contract award the approved Risk Register should be regularly updated by the Contractor/ Supplier during the phases of the package delivery and submitted as part of Monthly Progress Reports.

2.4 Monthly Risk Report (Post-award)

Monthly risk reporting (as part Monthly Progress Reports) is defined by item A03 of SDRL and consists of two parts. Part One is a structured narrative that describes major risk activities and events during the reporting period and should contain:

- Comments on major changes in the risk register (addition of new risks or addressing actions, change of risk ownership or status, retirement of risks, risk re-assessments, etc.) with a focus on Medium and High level risks.
- Highlights of 5 to 7 most important package risk management activities and events (e.g., risk reviews and workshops (internal and with sub-vendors), implementation of addressing actions and possible related issues, successes and failures related to risk management, any occurred risks, etc.)

Part Two is an updated package Risk Register.

3 RISK MANAGMENT REVIEWS

Standard requirement is to hold Monthly Risk Reviews based on submitted Monthly Risk Reports.

Review requirements, including types and frequency of the risk management reviews and audits post-award, will be initially introduced in the package RFP and finally stipulated by the Contract's Coordination Procedure.

4 FIGURES

4.1 Summary of the Risk Requirements for Bidders and Contractors/Suppliers

	Requirement	Description	Reference Documents
Pre-Award	Risk Questionnaire	Contains list of generic risk questions as well as package specific ones; requirements are described in section 2.1.	Appendix of RFP
	Risk Management Plan	Provides description of the risk process, organizational context and tools adopted by a Bidder; requirements are described in section 2.2.	SDRL item A04; Appendix of RFP
	Risk Register (part of the Risk Management Plan)	A log of package risks developed by a Bidder including their assessments before addressing, their addressing actions and assessment after addressing; requirements are described in section 2.3.	SDRL item A04; Appendix of RFP
Post-Award	Risk Management Plan	Provides description of the risk process, organizational context and tools adopted by a Contractor/ Supplier and agreed upon in the Contract's Coordination Procedure; requirements are described in section 2.2.	SDRL item A04; Contract's Coordination Procedure
	Monthly Risk Report	A summary of monthly activities carried out by a Contractor/ Supplier aimed at addressing selected risks; the Coordination Procedure of the Contract defines if all package risks are subject to monthly reporting or only selected ones; requirements are described in section 2.4. Normally, Monthly Risk Reports are a subject to Monthly Risk Reviews.	SDRL item A03; Contract's Coordination Procedure
	Risk Register (part of the Monthly Report)	The Coordination Procedure of the Contract defines if all package risks are subject to monthly reporting by the Contractor/ Supplier or only selected ones; requirements are described in section 2.3.	SDRL item A03; Contract's Coordination Procedure

4.2 Recommended Package Risk Assessment Matrix

Risk Ranking Score = (Impact Score) x (Probability Score)	Risk Level Colour Code	Low	Medium	High

		IMPACT				
		Insignificant (1)	Minor (2)	Moderate (3)	Major (4)	Extreme (5)
PROBABILITY	>90% Almost Certain (5)	5	10	15	20	25
	50% - 90% Likely (4)	4	8	12	16	20
	1% - 50% Possible (3)	3	6	9	12	15
	0.1% - 1% Low (2)	2	4	6	8	10
	< 0.1% Rare (1)	1	2	3	4	5
PROJECT OBJECTIVES	**Capital Cost, $M**	**< 0.1**	**0.1 - 1**	**1 -- 10**	**10 - 100**	**>100**
	Schedule, Mos (First Power Target Date)	**< 0.25**	**0.25 - 1**	**1 -- 3**	**3 -- 12**	**>12**
	Product Quality (Availability, Reliability, Performance)	Potential degradation of element performance, system level not affected.	Decrease in system performance, however still above requirement.	Decrease in system performance eliminates all design and operating margins.	Decrease is system performance that substantially affects performance objectives.	System requirement is not achieved, safety objectives are not achievable. System or element is effectively useless.
	People (Health & Safety)	Minor impact on personnel. First aid only. No lost time.	Potential to cause medical treatment of personnel. Lost time incident.	Injury to personnel that does not result in some permanent disability. Multiple lost time incidents outside established targets.	Serious personal injury resulting in permanent disability. Total lost time well outside established targets to the point where operations are temporarily suspended.	Potential to cause single or multiple fatalities.
	Environmental (Physical)	Slight Effect: e.g. Non-reportable spill or release contained within the immediate work area, negligible financial consequences, no lasting effect.	Minor Effect: e.g. Sufficiently large contamination or discharge to damage environment, but no lasting effect. Single breach of statutory or prescribed limit or single complaint.	Localized Effect: e.g. limited discharges affecting the local area and damaging the environment. Repeated breaches of statutory/regulatory limit or multiple complaints.	Major Effect: e.g. Severe environmental damage. The company is required to take extensive measures to restore the damaged environment. Regulatory restriction or enforcement action probable.	Massive Effect: e.g. Persistent severe environmental damage or severe impact extending over a large area resulting in major financial implications for the Project. Direct impact on public with prosecution possible.
	Reputation	No or very minor media attention. Little or no loss in Package Owner's trust.	Some unfavourable media attention. Some loss in Package Owner's trust which can easily be rebuilt.	Local media coverage only. Some loss in Package Owner's trust that will require commitment to rebuild.	Local and possibly national media coverage. A loss in Package Owner's trust that it is doubtful whether it can be rebuilt.	National and international media coverage. An irreparable loss in Package Owner's trust.

4.3 Sample Risk Register Template

RISK DEFINITION				RISK ATTRIBUTES			ASSESSMENT "AS-IS"							RISK ADDRESSING				ASSESSMENT "TO-BE"

MAINTENANCE OF THE PROJECT-WIDE ENVIRONMENTAL PROTECTION PLAN (P-WEPP)

This P-WEPP will at times require updating in response to changes in the Project, contractor work methods, group structure, or technological advancements that provide higher level of environmental protection. The subsections below indicate the process with respect to maintenance and implementation of the P-WEPP.

Initiating Revisions

This P-WEPP is a controlled document and revisions may only be processed by SNC Lavalin's (SLI's) Environmental Manager. It is anticipated that most of the revisions to this P-WEPP will be initiated by the environmental management team at the site or at the Lower Churchill Project office in St. John's.

Nalcor staff shall request revisions through document control. P-WEPP holders and readers/reviewers (within SLI, government agencies, contracting firms, other stakeholders, etc) may request revisions by forwarding a completed Revision Request Form (RRF), provided in Section 8, to SLI's Environmental Manager. These revision requests will be screened and reviewed by SLI in conjunction with Nalcor staff, and forwarded to SLI's Project Manager for approval.

Compliance Instructions

Revision requests that have been accepted by SLI's Project Manager will be sent to SLI's Environmental Manager for distribution to key Project participants as "Compliance Instructions". These instructions shall be signed off by key holders of the P-WEPP and returned within two (2) days of receipt. A log of compliance instructions shall be maintained by SLI's Environmental Coordinator (Hydro), and these will be incorporated periodically into a revised edition of the P-WEPP.

Revision Procedures

Revisions to the P-WEPP shall be made annually, or as required, in accordance with SLI's document control procedures. SLI's Environmental Manager will issue the accepted revisions of the P-WEPP to key holders, Contractors, and readers/reviewers. Each revision will be accompanied by a Revision Control Record (provided in Section 8) that:

a) Identifies all compliance instructions that have been issued since the last revision; and

b) Lists the sections being superseded.

Within two working days of receiving a revised Plan, P-WEPP holders shall:

a) Familiarize themselves with revised sections of the P-WEPP*;*

b) Incorporate all revisions into their areas of responsibility, as appropriate;

c) Ensure that all personnel are familiar with the revisions; and

d) Acknowledge receipt of the revised P-WEPP by forwarding via fax, email, or mail a signed and dated Acknowledgement Form to SLI's Environmental Manager. The Receipt of Revision Acknowledgement Form is located in Section 8.

1 INTRODUCTION

Environmental Protection Plans are of critical importance to large construction projects. The Project-Wide Environmental Protection Plan (P-WEPP) will ensure a high level of environmental protection in all of the Project's work areas during construction and commissioning. This P-WEPP is a working document for use at site by Project personnel and contractors. It will help ensure conformance with both NE-LCP and SLI policy statements. It also will serve as a tool for Project participants, including regulators, to monitor regulatory compliance and to improve on environmental performance.

This P-WEPP contains standard environmental protection procedures, or mitigation measures, for activities commonly associated with large projects of this type. The objectives of this P-WEPP are to:

a) Anticipate potential negative environmental effects associated with construction; and

b) Implement appropriate mitigation measures to minimize or avoid negative effects where practical.

Negative effects include impacts to air quality and climate, groundwater and surface water resources, soil, biota and their habitats, human health and communities, and natural and historic resources.

Reference documentation including publically available Federal and Provincial reference documents, guidelines, fact sheets and operational statements for information detailed in the P-WEPP is located in reference document # GV-0003-01. A list of reference documents is outlined in Section 9.

1.1 PURPOSE

The purpose of this P-WEPP is to establish work practices and assign roles and responsibilities that all Project participants shall follow to mitigate negative

environmental effects associated with construction and commissioning of the Lower Churchill Project.

Specifically the purpose of this P-WEPP is to:

a) Document the conditions and requirements of Environmental Assessment (EA) release;

b) Outline the Lower Churchill Project's commitments to minimize potential environmental effects - including commitments made in the Environmental Impact Statement (Nalcor, 2009) and during the regulatory review process under the Joint Review Panel (JRP);

c) Provide concise and clear instructions to Lower Churchill Project participants regarding procedures for protecting the environment and minimizing potential impacts to the environment;

d) Provide direction to Lower Churchill Project participants regarding issues and concerns of stakeholder groups including aboriginal peoples, fisheries groups, landowner groups and the public;

e) Provide a reference document for Lower Churchill Project participants to use when planning and/or conducting specific construction and commissioning activities;

f) Provide direction for environmental orientation programs for Lower Churchill Project participants;

g) Document changes to the P-WEPP originating through the interactive revision process;

h) Provide a reference to applicable legislative requirements and guidelines; and

i) Provide a detailed summary of environmental issues and protection measures to be implemented during construction.

1.2 SCOPE AND APPLICATION

The scope of this P-WEPP covers the engineering, procurement, construction, and commissioning phases of the Lower Churchill Project for Components 1 and 4b. The focus of the P-WEPP is on construction activities, including activities along the transmission line from Muskrat Falls to Churchill Falls, the proposed reservoir, site access roads, accommodations complex, laydown areas and the Muskrat Falls generation facility. Section 2 describes the Project in more detail.

Please note that there are additional components of the Project that are outside the scope of this P-WEPP. They include the following:

- Component 2: Gull Island Generation Facility
- Component 3: an ac to dc converter station at Muskrat Falls near the lower Churchill River in Central Labrador; a dc to ac converter station at Soldiers Pond, with some associated Island system upgrades; electrodes, in the Strait of Belle Isle (L'anse Au Diable, Labrador) and Conception Bay (Dowden's Point, Newfoundland); transition compounds at Forteau Point and Shoal Cove; ac switchyards at Soldier's Pond and Muskrat Falls; and synchronous condensers at Soldier's Pond.
- Component 4a: Labrador Island Transmission Link: an overhead HVdc transmission line from Muskrat Falls to the Strait of Belle Isle (approximately 383 km); an overhead HVdc transmission line from the Strait of Belle Isle to Soldiers Pond on the Island's Avalon Peninsula (approximately 695 km); an overhead electrode line from the Soldiers pond to Dowden's Point (approximately 12km) and an overhead electrode line from the HVdc transmission line to Lanse-au-diable (approximately 22km).
- The cable crossing at the Strait of Belle Isle.

In addition, this P-WEPP does not cover the Operations phase of the project and a separate EPP for this will be developed and submitted at a later date.

This P-WEPP is one component of the Lower Churchill Project's *Environmental Management Plan (SLI Document # 505573-0000-68RA-I-0004, NE-LCP Document # MFA-SN-CD-0000-EV-PL-0001)*. Other subordinate documents of the Environmental Management Plan include the following:

a) *Contract-Specific Environmental Protection Plan (*C-SEPP*) Template (SLI Document # 505573-0000-68RA-I-0011, NE-LCP Document # LCP-SN-CD-0000-EV-PL-0006-01)*

b) *Rehabilitation Plan (RP) (SLI Document # 505573-0000-68RA-I-0007, NE-LCP Document # LCP-SN-CD-0000-EV-PL-0004-01);*

c) *Regulatory Compliance Plan (RCP) (SLI Document # 505573-0000-68RA-I-0003, NE-LCP Document # LCP-SN-CD-0000-RT-PL-0001-01); and*

d) *Waste Management Plan (WMP) - Component 1 and 4b (SLI Document # 505573-0000-68RA-I-0008, NE-LCP Document # LCP-SN-CD-0000-EV-PL-0005-01)*.

Nalcor's Emergency Response Plan and Master Spill Response Plan (MSRP) are companion documents to the Environmental Management Plan. The MSRP shall be used by contractors as a basis for preparing their own spill response plans.

This P-WEPP applies to all Project participants, including NE-LCP, SLI, contractors, subcontractors, suppliers, service providers, and all employees of these organizations.

Given the Lower Churchill Project's magnitude, accepted *Contract-Specific Environmental Protection Plans (*C-SEPP*s)* shall be required. C-SEPP*s* shall be prepared by all contractors for all construction contracts to ensure that effects on the environment are minimized to the extent practical. These C-SEPP*s* shall provide sufficient detail on the Contractor's:

a) Scope of work;

b) Methods of construction;

c) Sequence of activities;

d) List of resources (i.e. equipment and site workforce);

e) Temporary and permanent installations;

f) Environmental protection procedures and alternative procedures, if required; and

g) Environmental contingency measures.

This P-WEPP shall serve as a resource to contractors as they prepare their own C-SEPPs. Contract packages shall include C-SEPP templates, with specific instructions on how these templates are to be properly completed. All C-SEPPs shall require acceptance by both SLI and NE-LCP prior to the contractor's mobilization to site.

In certain cases, particularly in areas where environmental risks are elevated, specific mitigation measures shall be engineered for the Project. These measures, detailed in the form of technical specifications and construction drawings, shall form part of the contract packages.

2 PROJECT DESCRIPTION

2.1 MUSKRAT FALLS HYDROELECTRIC DEVELOPMENT (COMPONENT 1)

Muskrat Falls is one of two hydroelectric developments being planned for the lower Churchill River. The remotely controlled nominal 824 MW Muskrat Falls Hydroelectric Development will be composed of the following sub-components and associated ac connector lines to an ac switchyard:

a) 16 km of permanent access roads, including upgrading of existing roads and new construction;

b) Reservoir, approximately 60 km long and 101.4 km^2 in total area;

c) Replacement fish habitat;

d) A north roller compacted concrete (RCC) overflow dam;

e) Gated spillway including:

   i) Approach and discharge channels; and

   ii) Vertical lift gates.

f) A close coupled intake and powerhouse including:

   i) intakes with gates and trash racks;

   ii) concrete lined water passages;

   iii) turbine/generator units at approximately 206 MW each with associated ancillary electrical/mechanical control equipment;

   iv) power transformers (includes 1 spare), located on the draft tube deck of the powerhouse; and

   v) 2 overhead cranes;

g) A south dam;

h) Component diversion works (i.e. cofferdam and spillway for diversion channel);

i) Stabilized north spur;

j) ac switchyard at Muskrat Falls; and

k) Churchill Falls switchyard extension.

Figure 2-1 shows the current concept for the generating facility.

Figure 2-1: Muskrat Falls Generating Facility (Component 1)

2.2 SUB-COMPONENT 4B: HVAC OVERHEAD TRANSMISSION LINE MUSKRAT FALLS TO CHURCHILL FALLS

a) Transmission lines from Muskrat Falls to Churchill Falls:

i) 2-315 kV ac, 3 phase lines, double bundle conductor;

ii) Single circuit galvanized lattice steel guyed suspension and rigid angle towers; and

iii) 250 km long.

2.3 CONSTRUCTION RELATED INFRASTRUCTURE

Construction related infrastructure will be established to support construction activity for components 1 and 4b. Some of this infrastructure is temporary and shall be decommissioned before the end of the construction phase. It is anticipated that the following infrastructure will be required:

a) A 1,500 person accommodations and administration complex (for construction period);

b) Access roads associated with the main dam structure, the accommodations complex and reservoir;

c) Diversion facilities (i.e. upstream and downstream coffer dams, the latter of which is to be removed prior to tailrace flooding);

d) Borrow pits and quarries;

e) Construction bridge;

f) Concrete and crushing plants;

g) Construction power and site communications infrastructure;

h) Reservoir clearing camps and wood storage yards;

i) Material storage and laydown areas including the potential use of port facilities (if upgrades are required to port facilities they shall be completed by the responsible party);

j) Fuelling and fuel storage facilities;

k) Spoil areas;

l) Muskrat Falls 25 kV construction power line & construction power terminal substation;

m) HVac transmission line construction camps; and

n) Trash and debris collection boom, associated roads and debris storage areas.

3 ROLES AND RESPONSIBILITIES

The Lower Churchill Project environmental management team is comprised of Nalcor Energy – Lower Churchill Project (NE-LCP) and SLI environmental, engineering, and construction management staff. A responsibility matrix is provided in Figure 3-1. Figure 3-2 illustrates the team structure. Roles and responsibilities of team members are further defined in the sections that follow.

Figure 3-1: Responsibility Matrix

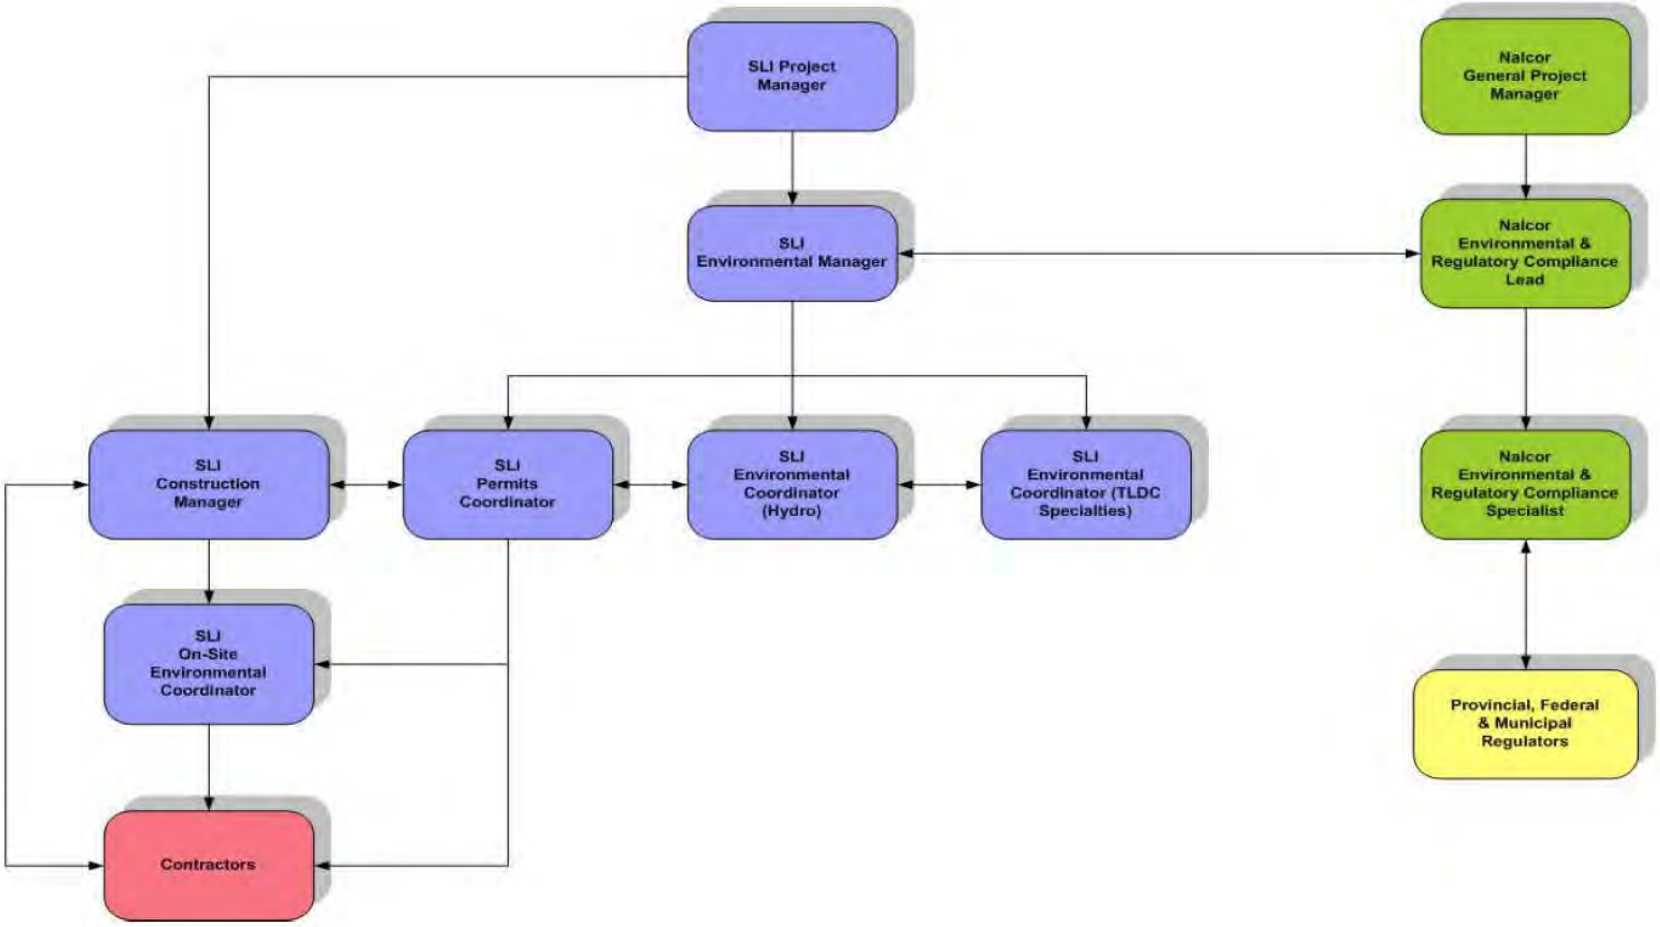

Figure 3-2: Lower Churchill Project Hydroelectric Generation Facility Project: Environmental Management Team

3.1 NALCOR ENERGY – LOWER CHURCHILL PROJECT

3.1.1 NE-LCP Auditing Function

NE-LCP shall periodically perform audits on SLI's performance as it relates to the P-WEPP.

3.1.2 Individual Responsibilities

NE-LCP's General Project Manager shall be accountable for the acceptance of the P-WEPP and responsible for the acceptance of the C-SEPP. NE-LCP's General Project Manager shall be consulted on the various aspects of P-WEPP management. This person shall also be consulted on environmental compliance monitoring processes such as daily field reports, quarterly environmental audits and annual environmental performance reviews. Environmental effects monitoring is the responsibility of NE-LCP and the General Project Manager shall be accountable for this. NE-LCP's General Project Manager shall be supported in this function by NE-LCP's Environmental and Regulatory Compliance Lead and Environmental and Regulatory Compliance Specialist.

3.2 SLI

3.2.1 SLI Auditing Function

The purpose of the auditing function shall be to evaluate the performance of the P-WEPP and to identify opportunities for continual improvement.

Auditing shall consist of daily field reports, quarterly environmental compliance audit reports and annual performance reviews.

The daily field reports shall be completed by the On-Site Environmental Monitors, who review daily activities of the Contractors.

The quarterly environmental compliance audit reports shall be completed by SLI Environmental Coordinators for the Transmission and Hydro components. The reports shall document all incidents of non-compliance with the P-WEPP and their

causes. SLI's Environmental Coordinators shall distribute the environmental compliance audit reports to relevant Project participants.

The annual performance review shall be completed by the key members of the environmental and construction teams. This audit shall include a review of all work activities that relate to environmental concerns, issues and/or mitigations and shall include a review of environmental audits carried out by NE-LCP during the year. The review process shall give all parties a chance to evaluate overall environmental performance and compliance with government regulations, permits, this P-WEPP, and C-SEPPs.

3.2.2 Individual Responsibilities

SLI Project Manager: The SLI Project Manager shall be accountable for development, implementation and management of the P-WEPP and shall be informed of acceptance of the P-WEPP. This person shall be responsible for implementation and management of C-SEPPs and be accountable for review and acceptance of C-SEPPs. The Project Manager shall be informed of all activities accountable and responsible by NE-LCP. The Project Manager is considered to be responsible for implementation and management of C-SEPPs, along with the Contractor.

SLI Environmental Manager: The SLI Environmental Manager shall be responsible for the development, review, implementation and management of the P-WEPP and review, acceptance and implementation of the C-SEPP as well as all environmental compliance monitoring. SLI's Environmental Manager shall be informed of all activities accountable and responsible by NE-LCP such as acceptance of the P-WEPP and C-SEPP and environmental effects monitoring.

SLI Environmental Coordinator (Hydro and Transmission): The SLI environmental coordinators for Hydro and Transmission together shall be responsible for implementation of the P-WEPP as it relates to their individual components. They shall support the Environmental Manager with managing changes to the P-WEPP. They shall also be responsible for review, acceptance and implementation of the C-

SEPPs. They shall be responsible for Project Environmental Awareness such as orientation of SLI employees, visitors and contractors. They shall be responsible for certain aspects of environmental compliance monitoring such as reviewing daily field reports, quarterly environmental audits and responsible for managing the non-conformance registry (in consultation with the Permits Coordinator). They shall be informed on environmental effects monitoring details.

SLI Permits Coordinator: The SLI Permits Coordinator shall provide support for the development and implementation of the P-WEPP and shall be consulted on management or revisions of the P-WEPP. This person shall provide support for C-SEPP implementation and project environmental awareness through orientation. SLI's Permits Coordinator shall provide support and consultation for several aspects of environmental compliance monitoring. This person shall also be consulted on the review of the P-WEPP to ensure compliance with permit conditions. The Permits Coordinator shall be responsible for managing the permit registry (in consultation with the hydro and transmission coordinators) and shall be informed of environmental effects monitoring details.

SLI Component Managers: The SLI Component Managers shall be responsible for ensuring the P-WEPP is included in procurement packages, which falls under implementation of the P-WEPP. They shall provide support for the development of the P-WEPP and the C-SEPP and shall be responsible for implementation of the C-SEPP. They shall be responsible for project environmental awareness such as orientation of SLI employees, visitors and contractors and ensuring daily field reports are completed. They shall be informed about all other aspects of the P-WEPP, C-SEPP and compliance tracking.

SLI Construction Managers: The SLI Construction Managers shall be responsible for overseeing construction management including management of on-site environmental issues through implementation of the P-WEPP. They shall also be responsible for the acceptance and implementation of the C-SEPPs and also for revisions to this document. The Construction Managers shall report directly to Nalcor's Site Manager and shall be responsible for certain aspects of environmental

compliance monitoring and compliance tracking. The Construction Managers shall also be responsible for ensuring visitors, contractors and SLI employees on the site receive the appropriate orientation and training required.

SLI Interface Manager: The SLI Interface Manager shall be informed on all aspects of the development and implementation of the P-WEPP and C-SEPPs. This person shall be responsible for project environmental awareness such as orientation of SLI employees, visitors and contractors. This person shall be informed during environmental compliance monitoring, compliance tracking and environmental effects monitoring.

SLI Area Manager: The SLI Area Managers shall be informed on all aspects of the development of the P-WEPP and C-SEPPs. They shall be responsible for ensuring implementation of the P-WEPP and C-SEPPs by contractors. They shall be responsible for project environmental awareness such as orientation of SLI employees, visitors and contractors. They shall be informed of environmental compliance monitoring and environmental effects monitoring and shall provide support for the management of the compliance tracking registry.

SLI On-Site Environmental Coordinator: This individual shall coordinate all activities and monitoring effort by the On-Site Environmental Monitors to ensure the P-WEPP, C-SEPPs, and permit conditions are complied with. The On-Site Environmental Coordinator shall report directly to SLI's Construction Manager, and interface functionally with the Environmental Coordinators (Hydro and Transmission) and the Permits Coordinator.

SLI On-Site Environmental Monitors: the On-Site Environmental Monitor shall monitor on-site Project activities, evaluate the Contractors' environmental performance with respect to requirements established in the P-WEPP and C-SEPPs, evaluate the performance of designed/constructed environmental mitigation systems through sampling and testing programs, and track on-site compliance with regulatory requirements and conditions of all permits and approvals. They shall be responsible for producing daily field reports as part of environmental compliance monitoring and

shall provide support for managing the non-conformance registry. The On-Site Environmental Monitors shall report directly to SLI's On-Site Environmental Coordinator and functionally to SLI's Environmental Coordinators. They shall interact with the Contractors on environmental procedures and requirements, participate in Project team meetings, toolbox meetings, conduct environmental reviews of drawings, and assist in the revision and update of the P-WEPP and C-SEPPs as necessary. The On-Site Environmental Monitors shall also be responsible for ensuring employees, visitors and contractors on the site receive the appropriate orientation and training.

3.3 CONTRACTORS

Contractors and Subcontractors shall build, supply and/or install various components of the Project, or be involved in provision of services to support construction and/or procurement, as defined in the work scopes of their respective contract packages. The contractors shall be accountable and responsible for implementing environmental protection procedures as outlined in the P-WEPP and developing, implementing, and maintaining their own C-SEPP, as applicable. They shall be responsible for holding toolbox meetings at the start of each shift to discuss health, safety and environmental issues and shall be responsible for developing their own orientation and training package to deliver to individuals entering worksites on their behalf in addition to the project training noted above. They shall ensure P-WEPP conditions are reflected in their proposals and bids and shall comply with all relevant regulations, guidelines, permits, approvals and authorizations. The contractor may be consulted, as required, on aspects of environmental compliance monitoring and environmental effects monitoring.

3.4 PROJECT ENVIRONMENTAL AWARENESS

3.4.1 Employee Orientation

A Project environmental orientation has been developed and shall be presented to all people that arrive at the Project site. The orientation is considered a prerequisite to entering any of the Lower Churchill Project sites.

Project environmental orientation shall include elements of this P-WEPP such as: environmental protection procedures; proper storage and handling of materials; encounters with wildlife, rare/endangered species, historic resources, waste management, and emergency response.

Project environmental orientation shall be delivered by experienced individuals with an in depth knowledge of the P-WEPP and a knowledge of construction and execution activities.

The project environmental orientation shall include a review of the following:

a) Environmental management;

b) Environmental considerations;

c) Non-compliance and corrective actions;

d) Environmental contingency measures;

e) Incident reporting requirements;

f) All permit-required work; and

g) Construction site rules and regulations.

All personnel who attend the Project Environmental Orientation session shall be required to sign an attendance sheet, and shall be provided with access to copies of the P-WEPP, or C-SEPP as appropriate, and documentation indicating the completed training and expiration dates.

3.4.2 Visitor Orientation

A temporary orientation shall be provided to those persons who have arrived at the project but will not be completing any field construction work (meetings, office work, deliveries, etc.). The visitor orientation shall cover relevant environmental protection measures, project emergency procedures, environmental incident reporting requirements, and other general project environmental requirements.

Any person, who has not taken the full orientation program, shall be supervised by a designated, oriented Project person at all times, and shall abide by the P-WEPP.

3.4.3 Contractor Orientation

Contractors may develop and deliver additional environmental orientations to their workforces, visitors, consultants and inspectors on the details of their C-SEPP, and/or corporate requirements. The Contractor orientations are subject to review and acceptance by SLI's Environmental Manager.

3.4.4 Toolbox Meetings

Toolbox meetings (short, informal meetings) shall be held by the contractor with its field crews and supervisors at the beginning of each work shift. The toolbox meeting shall involve discussion of work task assignments for the day and any associated safety hazards. These meetings shall also provide the opportunity to discuss environmental concerns and applicable mitigation measures that apply.

4 RELEVANT LEGISLATION

There are regulatory requirements at the provincial, federal and municipal levels that apply to the design and construction of the Project. Compliance will be evaluated through a program of environmental compliance monitoring, primarily implemented by On-Site Environmental Monitors.

The project has adopted Nalcor Energy's Corporate Environmental Policy and Guiding Principles and its Environmental Management System meets the requirements of ISO 14001:2009 (Environment). As a result, environmental protection measures and mitigation associated with this Project shall meet the same high corporate standard.

All work undertaken during the design, construction and commissioning phases of this project shall be in accordance with the most recent guidelines. For a detailed discussion of the regulatory requirements for the Project see the *Regulatory Compliance Plan (SLI Doc. No. 505573-0000-68RA-I-0003, NE-LCP Document # LCP-SN-CD-0000-RT-PL-0001-01)*.

4.1 FEDERAL

The following federal environmental acts apply to one or more aspects of Project:

a) *Canadian Environmental Assessment Act (CEAA);*

b) *Canadian Environmental Protection Act (CEPA);*

c) *Species at Risk Act (SARA),*

d) *Navigable Waters Protection Act (NWPA);*

e) *Transportation of Dangerous Goods Act, 1992;*

f) *Oceans Act;*

g) *Canada Shipping Act;*

h) *Migratory Bird Convention Act; and*

i) *Fisheries Act*.

4.2 PROVINCIAL

The following provincial acts and regulations apply to one or more aspects of the Project:

a) *Dangerous Goods Transportation Act;*

b) *Endangered Species Act;*

c) *Forestry Act;*

d) *Historic Resources Act;*

e) *Newfoundland and Labrador Lands Act;*

f) *Environmental Protection Act* (EPA);

- *i) Air Pollution Control Regulations, 2004*
- *ii) Gasoline Volatility Control Regulations, 2003*
- *iii) Pesticides Control Regulations, 2003*
- *iv) Storage and Handling of Gasoline and Associated Products Regulations, 2003*
- *v) Used Oil Control Regulations, 2002*
- *vi) Waste Diversion Regulations, 2005*
- *vii) Waste Management Regulations, 2003*
- *viii) Waste Material Disposal Areas, 1996*

g) *Nalcor Energy/Lower Churchill Generation Project Undertaking Order, Environmental Protection Act;*

h) *Wildlife Act; and*

i) *Water Resources Act;*

- *i) Well Drilling Regulations, 2003*

ii) *Water Power Rental Regulations, 2003*

iii) *Environmental Control Water and Sewage Regulations, 2003*

j) *Motorized Snow Vehicles and All-Terrain Vehicles Act*

i) *Motorized Snow Vehicles and All-Terrain Vehicles Regulations, 1996*

4.3 MUNICIPAL

In some areas, construction activity will take place within municipal boundaries. In these areas, local bylaws shall be complied with and permits obtained.

5 GENERAL ENVIRONMENTAL PROTECTION PROCEDURES

In general, environmental mitigation shall be planned and designed prior to issuing proposal calls for construction contracts. Environmental mitigation plans and specifications shall be incorporated into documents provided to prospective contractors for proposal purposes.

Environmental mitigation shall be consistent with applicable standards, codes, acts and regulations and the conditions of Environmental Assessment (EA) Release.

This section contains a comprehensive suite of Environmental Protection Procedures to be used.

The procedures in this section may need to be modified in the future to address new activities, unforeseen site conditions, changes in engineering design and/or construction work methods, or new environmental performance standards. These changes will be part of the maintenance of the P-WEPP as outlined in the front of this report.

5.1 SCHEDULING AND TIMING OF CONSTRUCTION ACTIVITIES

Construction planning is one of the most fundamental activities in the management and execution of construction projects. One of the most important factors in a large scale project is the scheduling and timing of various activities. Of primary importance will be maintenance of the Project schedule. However, sensitive time periods outlined in the section below shall be considered in Project planning where practical. Where activities are to be carried out during sensitive time periods additional mitigations shall be applied as required.

Environmental Concerns

Construction activities shall be organized so that various tasks that must be accomplished have the necessary precedence and resources required to complete the task.

Environmental Protection Procedures

a) A complete schedule of activities provided by the Contractor and accepted by On-Site Environmental Monitors shall be completed prior to commencement of any construction task and any restrictions on timing shall be noted on the schedule;

b) While the ideal time of year for construction near a body of water is early June through late October, due to the low flow and low rainfall period; construction will be occurring in other times and specific attention shall be paid to ensure environmental mitigations are applied during this period;

c) Stripping, grading, excavating and/or rehabilitation activities shall be scheduled to minimize the amount of time the soil is exposed to elements;

d) Activities shall be conducted in such a way as to reduce the amount of time spent in or around a stream or water body;

e) Construction activities shall be scheduled, where possible, to avoid any sensitive areas of fish and wildlife habitat and critical periods in fish and wildlife cycles. The sensitive life stages of wildlife in Labrador are illustrated in Table 5-1. These

are used to identify the timing of migration, spawning and calving in the vicinity of the site, which shall be considered, where possible, in the scheduling of construction activities; and

f) If timing is not ideal, alternative mitigations shall be implemented.

Table 5-1: Sensitive Life History Stages of Aquatic and Terrestrial Fauna *

5.2 CONSTRUCTION ENTRANCE

Environmental Concerns

Construction entrances typically consist of a gated right-of-way and a security building. Environmental concerns include the vegetation clearing that may be required for the construction of these features, and tracking of dirt and mud from the site onto public roads and streets.

Environmental Protection Procedures

Measures to remove mud and dirt from vehicles, heavy equipment and pedestrians shall be required. Measures include rumble racks, tire washes and sediment traps.

a) All cleaning activities should occur on a gravel pad with runoff running through a sediment trapping device prior to discharge;

b) The gravel pad should be designed for the heaviest vehicle anticipated on site;

c) Ensure all site traffic use the facility and ensure the sediment trapping device is cleaned and maintained regularly;

d) Temporary erosion control measures shall be applied as required in the area of vegetation clearing for any gate areas or entrance buildings. See Section 5.25 for applicable control measures; and

e) Ensure proper cleaning of machinery/vehicles to prevent potential spread of invasive species.

5.3 LINEAR DEVELOPMENTS

Environmental Concerns

Linear developments encompass a diverse range of standard construction related activities such as ditching, right-of-way clearing, roads and transmission line construction. Environmental concerns associated with linear developments include potential sedimentation/erosion, and the loss of vegetation and fish/wildlife habitat. Linear features can also have a negative impact on caribou beyond habitat loss.

Environmental Protection Procedures

Road Construction & Ditching

a) Aggregate (fill) materials for construction purposes shall not be removed from any stream;

b) Sedimentation control measures as outlined in Section 5.25, Erosion Prevention and Sediment Control shall be followed. Solids that accumulate in a settling pond or behind a sediment trap shall be removed on a regular basis to ensure such systems remain effective;

c) Work shall not be undertaken on easily erodible materials, during or immediately following heavy rainfalls without approved protection measures in place;

d) Buffer zones shall be flagged prior to any disturbance activities, as required;

e) Natural vegetation shall be left in place where possible. Rights-of-way, particularly in areas of dense vegetation, shall be as narrow as practicable; loss of ground vegetation shall be kept to a minimum;

f) Roads shall be adequately ditched so as to allow for good drainage. Where possible ditches shall be kept at the same gradient as the road;

g) Drainage from areas of exposed fill shall be controlled by grade or ditching and directed to vegetated areas away from all watercourses and at least 30 m from stream crossings. These drainage areas shall be determined in consultation with the On-Site Environmental Monitors;

h) Surface water shall be directed away from work areas by ditching. Runoff from these areas shall have sediment removed by filtration or other suitable methods as outlined in Section 5.25 and shall be directed away from wetlands and watercourses;

i) The sediment control measures shall be determined on site by the Contractor personnel and accepted by the On -Site Environmental Monitor;

j) Check dams shall be used as required to reduce runoff from work areas with exposed soil;

k) In areas where natural vegetation must be removed, the topsoil layer shall be separately stored from grubbed material for rehabilitation;

l) Cut areas through silt and clay materials shall have erosion prevention measures (Section 5.25);

m) Temporary erosion control shall be applied on exposed slopes in sensitive areas immediately following exposure of a slope. A permanent control measure shall be installed shortly thereafter. See Section 5.25 for applicable erosion control measures;

n) The cutting and filling phase of road construction, and the development of other work areas, shall be conducted as outlined in the following procedures:

    i) Cutting and filling shall be done only upon completion of grubbing. Where engineering requirements do not require grubbing (e.g., within the buffer zone of a stream crossing), filling shall occur without any disturbance of the vegetation mat or the upper soil horizons;

    ii) Filling in the vicinity of stream crossings shall be done in a manner which ensures that erosion and sedimentation of watercourses, water bodies and other ecologically sensitive areas such as wetlands is minimized and done in strict compliance with the required watercourse alteration permits from the DOEC. The hydrologic function of wetlands shall be maintained;

iii) The infilling of watercourses and water bodies shall not be permitted except as authorized by regulatory agencies and with the approval of the On-Site Environmental Monitor. The On-Site Environmental Monitor shall inspect the work to ensure it is completed in compliance with the required watercourse alteration permits from the DOEC, a letter of advice from DFO (if issued) and the Authorization for Works or Undertakings Affecting Fish Habitat from DFO, if required;

iv) Buffer zones shall be maintained between the roads and the bank of any watercourse they parallel (refer to Section 5.18); and

v) Road fill shall be dry and ice free. On areas of sensitive terrain, excess fill shall be end-dumped from the established roadbed.

o) Culverts shall be installed to maintain natural cross-drainage and to prevent ponding;

p) The number of stream crossings shall be minimized. Where the road must cross a stream, the environmental protection procedures detailed in Section 5.17 shall be followed;

q) Where possible, construction activities shall avoid areas of wildlife concentrations to prevent undue disturbance of wildlife during critical periods (See Sections 5.1, 5.32 and 5.34). If encounters with wildlife are unavoidable, then contingency plans detailed in Section 7 shall be followed;

r) Boundaries shall be staked for all rights-of way, road easements, facilities, infrastructure and borrow sites that will be developed;

s) Where possible, rights-of-way shall avoid known archaeological, historical and/or spiritual sites and required buffers shall be respected (See Section 5.18). Where they cannot be avoided, the site shall be mitigated to satisfaction of Provincial Archaeological Office (PAO) prior to work proceeding. If any archaeological or historical sites are encountered (known or otherwise), all work shall cease in that area until approval to proceed has been granted by the PAO; and

t) Reference shall be made to the *Guidelines for Protection of Fish Habitat in Newfoundland and Labrador, 1998.*

Right-of-Way Clearing

a) All salvaged timber shall be piled at right angles to rights-of-way so as not to obstruct the access or work of others, damage vegetation or be placed within buffer zones of critical habitat;

b) Disposal of cleared non-merchantable timber, slashing and cuttings from cleared areas shall take place through mulching and/or piling to minimize the amount of slash. No burning of materials is permitted for this project;

c) If slash piles are to be used, they shall be piled so as not to cause unnecessary damage to vegetation outside the right-of-way. A 6.5 m break in slash piles shall be made every 200 m to allow for drainage and animal access. The maximum height of the piles shall not exceed 3 m; and

d) All conditions outlined under Road Construction and Ditching (above) as well as Transmission Line Development (below) that also apply to right-of-way clearing shall be adhered to.

Transmission Line Development

a) Where feasible and applicable, untreated wood should be used. Where untreated wood is not practical, it shall be treated with pentachlorophenol (PCP), chromated copper arsenate (CCA) ammonical copper arsenate (ACA), ammoniacal copper zinc arsenate (ACZA), or copper naphthenate (CuN) only (see Section 5.13.5.1 for information regarding the use of treated wood in and around waterbodies and protected water supply areas);

b) Access for the transmission line development shall follow the protective measures as listed above for roads and ditching;

c) Ground travel on the transmission line shall follow existing trails and tote roads where practical. Stream crossings shall follow DFO standard operating procedures (SOP) where feasible (i.e. one time ford, clear span bridge etc.)

Where the SOP cannot be adhered to, a stream survey and request for letter of advice from DFO may be required; and

d) Construction for overhead transmission lines shall follow DFO Standard Operating Procedures for stream crossings.

5.4 WINTER CONSTRUCTION

Environmental Concerns

The principal concerns associated with winter construction are potential effects on freshwater ecosystems and water quality.

Environmental Protection Procedures

a) Winter vehicles shall be confined to properly prepared, groomed and approved trails and to work sites;

b) Maintenance and refuelling of vehicles shall be restricted to designated areas;

c) Only streams or water bodies that are frozen shall be traversed, unless permits to ford are in place. (See the DFO Operational Statement for Ice Bridges and Snow Fills);

d) Any debris or materials placed upon the ice surface of any waterbody shall be removed immediately after job completion;

e) The ground must be frozen or a minimum 0.5 m snow cover for unfrozen ground is required for winter trails to avoid ground disturbance;

f) All known archaeological sites shall be avoided;

g) Snow removed for snow clearing operations shall be disposed of in areas directed by the On-Site Environmental Monitor; and

h) Gaps of at least 2 m shall be left in windrowed snow for ease of animal movements.

5.5 EQUIPMENT OPERATION AND MOVEMENT

A variety of equipment will be used on site during construction. This is a potential source of noise, air emissions, and potential leaks or spills.

Environmental Concerns

Noises associated with equipment operation and movement may negatively affect wildlife. Air emissions may have air quality implications. Accidental leaks or spills of fuel or other hazardous materials may affect soils, water, fish, vegetation and wildlife. Tracked equipment has the potential to disturb the ground around/at the site.

Environmental Protection Procedures

a) All approvals, authorizations and permits for Project activities shall be followed;

b) Noise control procedures shall be followed during construction (Section 5.31);

c) All equipment shall have exhaust systems regularly inspected and mufflers shall be operating in accordance with manufacturer's recommendations;

d) All equipment (e.g., diesel generators, etc.) shall meet the requirements of the *NL Air Pollution Control Regulations* under the *Environmental Protection Act,* as required. Diesel generators shall be registered with DOEC, as required. Refer to the guidance document for Approval of Diesel Generators (GD-PPD-061) for the registration form and guidance on completion;

e) All equipment use during construction shall follow the environmental protection procedures outlined in this P-WEPP. In the case of an accidental event resulting from the use of equipment (e.g., a fuel spill), refer to the contingency plans in Section 7;

f) All equipment on the Project site shall use only oils/lubricants that classify as "biodegradable" where feasible (see Section 5.13 for additional information on the use of biodegradable oils/lubricants);

g) ATVs and tracked vehicles shall only be used where necessary. ATV use shall comply with the Motorized Snow Vehicles and All-Terrain Vehicle Regulations,

1996, the Environmental Guidelines for Stream Crossings by ATV, 1994 and the DFO Fact Sheet ATVs, Fish Habitat and You;

h) The use of heavy equipment in or near water courses shall be minimized and restricted;

i) All equipment shall be regularly maintained and inspected. If problems are identified the equipment shall be taken out of service and repaired to prevent release of hydrocarbons into the environment; and

j) Best Management Practices outlined in “Best Practices for the Reduction of Air Emissions from Construction and Demolition Activities” (May 2005, ChemInfo Services Inc. for Environment Canada) shall be implemented to mitigate air quality effects during the site preparation and construction phase, where practical.

5.6 VESSEL OPERATIONS (BARGE/BOATS)

Vessel traffic during construction may be required, including barges, tugs and ocean-going barges, and marine vessels to transport equipment and supplies to the construction sites. Heavy lift vessels shall be used for some of the larger modules particularly if they are being transported on the high seas. All vessels shall meet Transport Canada Regulations and standards, under the *Canada Shipping Act*, as well as international regulations established by the International Maritime Organization (IMO).

Environmental Concerns

Project vessel traffic may at times increase vessel traffic in Goose Bay and/or Cartwright. There is a risk due to increase in vessel traffic for vessels to collide, run aground and/or sink. Such events may lead to the accidental release of fuel and other hazardous materials to the marine environment. The release of non-compliant ballast water could also introduce non-indigenous species or deleterious substances into Canadian waters.

Environmental Protection Procedures

a) All vessel activity shall comply with the *Pollutant Discharge Reporting Regulations*, *Regulations for Prevention of Pollution from Ships* and *Dangerous Chemicals and Vessel Traffic Service Zones Regulations* as required under the *Canada Shipping Act*;

b) All commercial vessels twenty metres or more in length entering Goose Bay shall report to the MCTS centre;

c) The On-Site Environmental Monitors and the local public shall be advised of all particulars with regard to incoming/outgoing vessel traffic on a timely basis including updates regarding the estimated time of arrival/estimated time of departure (ETA/ETD) as advised by vessel masters;

d) Project vessel masters shall observe the following basic rules:

i) Demonstrate that they have a set of safety and emergency procedures on board;

ii) Advise the SLI site office of their time of departure from their port of origin and their estimated time of arrival at Happy Valley-Goose Bay or Cartwright;

iii) Notify the SLI site office of their progress at sea or, if stopping at other ports enroute, update their ETA;

iv) Relevant Canadian Hydrographic Charts or electronic charting systems shall be on board prior to leaving their port of origin; these charts shall be kept on board at all times;

v) Implement best management practices designed to achieve zero discharge of oily waste while at the site and along the shipping route;

vi) All Project-related vessels shall have onboard adequate oil spill response equipment to handle an accidental release of product into the environment; and

vii) Refer to the Master Spill Response Plan in the event or a spill or leak.

e) No Project-related vessels shall discharge wastes into surrounding waters. The discharge of garbage from ships into Canadian waters and the waters of the Fishing Zones of Canada is prohibited;

f) All crewmembers shall be familiar with emergency procedures for both life threatening and potentially polluting situations;

g) Vessel traffic shall not encroach on the marine or land portion of the Gannet Islands Ecological Reserve;

h) All stationary hazards, such as moored platforms or vessels, shall be clearly marked according to the *Navigable Waters Protection Act* and/or *Collision Regulations* under the *Canada Shipping Act*; and

i) All vessels shall comply with the *Ballast Water Control and Management Regulations SOR/2006-129,* under the *Canada Shipping Act.*

5.7 HELICOPTER TRAFFIC

Helicopter use at the Project site during construction will be required.

Environmental Concerns

Noise from the aircraft may disturb wildlife. Collisions with wildlife could result in mortality for both wildlife and humans and fuelling of helicopters may result in spills.

Environmental Protection Procedures

a) All aircraft shall maintain an altitude of no less than 500 m from concentrations of birds or other wildlife;

b) Flights for wildlife viewing or photography are not permitted, except when conducting wildlife surveys. Permits from the Wildlife Division are required for wildlife surveys;

c) The On-Site Environmental Monitor shall inform all charter pilots of the P-WEPP requirements;

d) All aircrafts shall inform the contractor of their expected arrival and departure times;

e) Aviation fuel caches shall have approval from Service NL;

f) The contractor shall ensure that helicopter landing areas are kept clear of equipment, materials/supplies at all times throughout the construction phase to avoid accidents or damage to the helicopter;

g) All aircraft operators shall review marine and aviation weather forecasts prior to departure;

h) Raptors (e.g., Bald Eagle, Osprey, Red Tailed Hawk) are known to nest within in the Project area. Under no circumstances shall nesting raptors be approached. The disturbance effects that helicopters have on nesting raptors can be detrimental for both the birds and the safety of the aircraft. All aircraft shall maintain a 300 m vertical and horizontal buffer from known active raptor nests between May 15 to August 15;

i) Locations along the Churchill River are known as spring and fall staging areas for waterfowl. Helicopters moving through these areas during this time (typically May or September) shall maintain a minimum altitude of 500 m from concentrations of waterfowl; and

j) The number of helicopter trips should be minimized to the extent feasible by combining trips or using other appropriate means of travel.

5.8 CLEARING OF VEGETATION

Environmental Concerns

Vegetation clearing (e.g., trees and shrubs) will be required during site preparation for work areas, laydown areas, roads, and for reservoir preparation. Environmental concerns include loss of habitat, sedimentation of watercourses, and disturbance or destruction of historic resources.

Environmental Protection Procedures

The following measures shall be implemented to reduce the potential effects of vegetation clearing:

General

a) All vegetation shall be removed in such a manner that will accommodate salvage of merchantable timber;

b) Clearing activities shall be limited to those areas that are required for reservoir preparation (i.e. trees in the stick-up and ice zones), as well as those areas that are required for construction of infrastructure;

c) All clearing shall comply with the requirements of all applicable permits, including a Commercial Cutting Permit and an Operating Permit;

d) A cutting permit shall be obtained prior to the start of any site clearing. Clearing and tree removal shall be restricted to the minimum areas needed for the site and stockpiles;

e) Clearing shall consist of cutting to within 15 cm or less of the ground and stockpiling of all merchantable timber; as well as the removal, piling and mulching of shrubs, debris and other non-merchantable timber in the area, as appropriate;

f) Disposal of cleared non-merchantable timber, slash and cuttings from cleared areas shall take place through mulching and/or piling to minimize the amount of slash. No burning of materials is permitted for this project;

g) If slash piles are to be used, they shall be piled so as not to cause unnecessary damage to vegetation outside the right-of-way. A 6.5 m break in slash piles shall be made every 200 m to allow for drainage and animal access. The maximum height of the piles shall not exceed 3 m;

h) Limits of clearing shall be shown on all drawings issued for construction. Only those areas designated on drawings shall be cleared. Trees shall be blazed/flagged at intervals in advance of clearing to demarcate the limits of the work. Blazed trees shall not be felled. For reservoir clearing however, the limits of work may not be marked in the field. Clearing activities shall not remove any trees outside the authorized clearing limits;

i) Slash and any timber shall not be permitted to enter any watercourse and shall be piled above spring flood levels;

j) Mechanical clearing by mechanical harvesters will likely take place within the reservoir area and main construction areas. For other clearing required, chain saws or other hand-held equipment may be used except where alternative methods or equipment are accepted by the On-Site Environmental Monitor;

k) Mechanical clearing by means other than mechanical harvesting equipment (i.e. bull dozer or excavators) shall not occur;

l) Fire fighting tools and water delivery systems must be available, as required, by the operating permit for the activity;

m) A buffer zone of undisturbed vegetation shall be maintained between construction areas and all water bodies (See DFO Operational Statement Aquatic Vegetation Removal in Freshwater Systems), watercourses, and ecologically sensitive areas (Section 5.18), unless otherwise authorized. Buffer zones within the reservoir shall be left in place and flooded. Buffer zone features shall be key elements of the environmental review of drawings prior to construction;

n) Where possible, timber shall be felled inward toward the work area to avoid damaging any standing trees within the immediate work area;

o) Workers shall not destroy or disturb any features that are indicative of a historical or archaeological site. Any such findings shall be reported immediately to the On-Site Environmental Monitor (see Sections 5.32.1 and 7.3);

p) Clearing activities between May 1 and July 31 shall be in compliance with the Avifauna Management Plan;

q) No clearing shall take place within 800 m of an active raptor nest between the months of May 15 to August 15. If a nest is encountered during clearing activities, all work shall stop until the site is evaluated and accepted by the On-Site Environmental Monitor, in consultation with the appropriate regulatory agencies;

r) If a tree containing an inactive eagle or osprey nest is encountered during site and reservoir clearing, the nest shall be assessed for viability and if the nest is deemed viable a platform shall be established as approved by the provincial Wildlife Division. For other raptors such as hawks and owls, active nests shall be identified as per the Avifauna Management Plan and appropriate buffers applied; and

s) If a tree containing an inactive raptor nest is encountered during transmission line clearing a platform will not be required as the tower will provide an alternative nesting site.

Merchantable Timber

a) Merchantable timber is defined as being 2.5 m or more in length with a top diameter not less than 9.1 cm and being of generally sound condition. Non-merchantable timber consists of all other vegetation with no merchantable value, such as small trees, shrubs, limbs and/or branches;

b) All merchantable timber shall be salvaged. It shall be cut into standard harvesting lengths (i.e., 2.5 - 3.5 m lengths), trimmed, and stored in identified stockpile

areas. For reservoir clearing, merchantable timber may be left as tree length. Figure 5-1 depicts poorly cut and piled wood and Figure 5-2 shows properly cut and piled wood; and

c) All merchantable timber within the specific clearing limits shall be stockpiled so as not to obstruct the access of work of others.

Figure 5-1: Poorly cut and piled wood

Figure 5-2: Proper way to remove, cut and pile wood

<u>Transmission Line/Road Rights-of Way</u>

a) All salvaged timber shall be piled at right angles to rights-of-way so as not to obstruct the access or work of others, damage vegetation or be placed within buffer zones of critical habitat; and

b) Slash and debris is to be disposed of as per items f) and g) of the general conditions outlined above.

5.9 PUMPS AND GENERATORS

Environmental Concerns

A variety of water pumps, hoses and generators will be in frequent use in many areas of the main construction site and at remote work camps. Environmental concerns are associated with any accidental spills or chronic leaks contaminating water bodies and soil. There may also be concerns with air emissions from generators on the site.

Environmental Protection Procedures

a) See Section 5.18 for required buffer zones for fuel and other hazardous materials storage and handling;

b) Drip pans shall be placed underneath pumps and generators. The drip pans shall be lined with absorbent material and shall have a cover to prevent water from entering. Absorbent material shall be kept at all sites where pumps and generators are in use;

c) Spill kits shall accompany all pumps and generators at the site (see Section 5.13);

d) Pumps and generators shall be located as far as practical from all waterbodies;

e) Pumps and generators shall be located on a level, stable surface. All pumps used for freshwater supply shall have a fine mesh screen on the intake hose;

f) Hoses and connections on equipment located near water bodies shall be inspected routinely for leaks and drips;

g) A water use license from the Water Resources Management Division shall be required for withdrawal of water from a waterbody;

h) All diesel generators on site shall meet the requirements of the *Air Pollution Control Regulations, 2004* under the *Environmental Protection Act* as required; and

i) All leaks shall be reported immediately to the On-Site Environmental Monitors. Upon detection of a leak, the equipment (i.e. pump, generator, etc.) shall be shut down immediately and corrective action taken to repair the leak and clean up any contaminated soil and/or water (Refer to the Master Spill Response Plan).

5.10 SURVEYING

Surveying activities may include: vegetation removal; traversing; establishing targets, permanent benchmarks and transponder stations.

Environmental Concerns

Surveying activities may disturb vegetation, wildlife, and historic resources.

Environmental Protection Procedures

Vegetation Removal

a) Where possible vegetation removal shall be scheduled to minimize disturbance to animals in sensitive areas or during sensitive time periods;

b) Width of survey lines shall be limited to that which is absolutely necessary for line of sight and unobstructed passage;

c) Whenever possible, cutting lines to the edge of open areas shall be avoided;

d) Trees and shrubs shall be cut flush with the ground wherever possible with stumps not to exceed 15 cm;

e) Cutting of survey lines shall be kept to a minimum;

f) All survey tape used at the site shall be made of biodegradable material;

g) All trees not exactly on transit lines shall be left standing and trees partly on line should be notched (notch not to exceed 1/3 tree's diameter) instead of removed, to allow sighting;

h) Discretion shall be used when large trees are encountered. For example, trees 30 cm at diameter breast height (dbh) or larger should, whenever possible, not be cut. On grid lines, trees of 30 cm diameter or larger shall be left intact and shall be traversed to continue the line;

i) Wildlife shall not be harassed or disturbed;

j) Vehicles shall yield the right-of-way to wildlife;

k) There shall be no cutting in areas designated as sensitive without notification of the On-Site Environmental Monitors;

l) Archaeological sites and features shall not be disturbed during survey work. Any historic resource discoveries shall be reported as per Section 5.32.1; and

m) Survey crews shall have a briefing on the recognition of historic resources prior to commencing work.

Traversing

a) ATVs shall not be allowed off the right-of-way, access and by-pass roads except where acceptable to the On-Site Environmental Monitor. ATV use shall comply with the *Motorized Snow Vehicles and All-Terrain Vehicle Regulations, 1996*, the *Environmental Guidelines for Stream Crossings by ATV, 1994* and the DFO Fact Sheet *ATVs, Fish Habitat and You*;

b) No motorized vehicles shall enter the areas designated as sensitive without notification of the On-Site Environmental Monitors;

c) Activity within sensitive areas shall be minimized; and

d) Walking in sensitive areas shall be restricted to established walking paths, where available.

Establishing Targets, Permanent Benchmarks and Transponder Locations

a) A driven T-bar, embedded to readily identify each benchmark location, shall be used;

b) Access to sensitive areas shall be accepted by the On-Site Environmental Monitors;

c) Standard iron bars and sledgehammers shall be used to establish benchmarks; and

d) Heavy equipment shall not be used to access sensitive areas.

5.11 DRILLING

5.11.1 Geotechnical

Drilling will be required as part of geotechnical investigations to recover soil samples, characterize the subsurface of proposed foundation, excavate areas and probe the bedrock surface. Seismic geophysical methods may also require drilling of shot holes in which small sources of energy (explosives, weight drop, air gun, etc.) are to be placed.

Environmental Concerns

The environmental concerns associated with drilling are surface disturbances, disposal of drilling fluids and cuttings, generation of dust, noise, and the potential effects on terrestrial habitats, historic resources, air quality and aquatic ecosystems.

Environmental Protection Procedures

The following mitigation measures must be followed when drilling at the site:

a) If water withdrawal is required for drilling, a request for project review to DFO is required. If a letter of advice is issued from DFO, all conditions shall be followed. A water use license is also required from the Water Resources Management Division;

b) Shot holes for seismic activities shall not be within 100 m of any water well, structure or buried service line;

c) Drilling mud, together with drilling cuttings and return water, shall be treated using a polydrill filter box or suitable alternative (See Figure 5-3). Solids collected shall be disposed of at an approved waste disposal site. All treated water shall be discharged on land to the environment in a manner that will promote permeation into overburden soils and will not enter or impair water bodies. If drilling mud is required, biodegradable products such as clear-bore or an approved equivalent shall be used. The type shall be documented and material safety data sheets (MSDS) provided and kept on file;

Figure 5-3: Poly Drill Filter Box used for solids removal in drilling applications

d) All discharges shall meet the Environmental Control Water and Sewer Regulations (ECWSR);

e) Drilling of boreholes shall be conducted in compliance with all conditions of the Exploration Approval for the work required under the *Mineral Regulations* issued under the *Mineral Act*;

f) All drilling equipment on the Project site shall use only oils/lubricants that classify as “biodegradable” (see Section 5.13 for additional information on the use of biodegradable oils/lubricants);

g) Due to the nature of drilling activities (quicksnaps, couplings) oil drops and leaks may occur. The area shall be cleaned up at every opportunity and all rigs shall be equipped with spill kits (as outlined in Section 5.13);

h) In the event of a hose rupture or loss of hydraulic fluid, the Master Spill Response Plan shall be followed;

i) Abandoned drill holes shall be sealed with a cement grout bentonite mixture;

j) If explosives are used in seismic shot holes, a blasting plan shall be reviewed with the On-Site Environmental Monitor to ensure any unexploded charges are removed from the holes prior to sealing;

k) Drilling sites shall be cleared of vegetation following the procedures detailed in Section 5.8;

l) Disposal of all drilling materials and associated solid wastes shall be undertaken in accordance with the procedures in Section 5.15;

m) Fuel shall be stored, handled and transported according to Section 5.13 and Section 5.18;

n) Water applications shall be used to control dust. Water-based drilling dust suppression systems may require anti-freeze in winter months, which shall be approved by the DOEC. The use of water for dust control or coring/wash boring shall be undertaken in a manner that ensures return water does not enter watercourses;

o) Drilling equipment shall have muffled exhaust to minimize noise.

p) No person shall deposit or permit deposition of oil, oil wastes or any other substance harmful to migratory birds in any waters or any area frequented by migratory birds; and

q) If possible, drilling shall be scheduled to minimize disturbance to animals in sensitive areas during sensitive time periods.

5.11.2 Water Well

Water well drilling may be required on land during hydrogeological investigations to evaluate groundwater quality and quantity of bedrock aquifers.

Environmental Concerns

The environmental concerns associated with drilling water wells are surface disturbances, disposal of drilling fluids and cuttings, generation of dust, noise, and the potential effects on terrestrial habitats, historic resources, air quality and aquatic ecosystems.

Environmental Protection Procedures

Potential drilling sites in sensitive areas shall be confirmed by the On-Site Environmental Monitors.

a) Drilling sites shall be cleared of vegetation following the procedures detailed in Section 5.8;

b) Disposal of all drilling materials and associated solid wastes shall be undertaken in accordance with the procedures in Section 5.15;

c) Fuel shall be stored, handled and transported according to Section 5.13;

d) Drilling equipment shall have muffled exhaust to minimize generated noise; and

e) Drilling of water wells shall be conducted in compliance with the *Water Resources Act* and the *Well Drilling Regulations*.

5.11.3 Marine and Riverine Environment

Marine and riverine drilling may be required during geotechnical investigations to determine foundation conditions - assess stability, and underlying seabed or riverbed for Project infrastructure. Drilling shall be conducted from a barge of suitable size.

Environmental Concerns

The environmental concerns associated with this type of geotechnical drilling in a marine/riverine environment include pollution from the release of drill cuttings and other drilling related debris, fuel or other hazardous material, noise generated by drill operations, and disturbance of aquatic ecosystems (marine communities and/or individual species) caused by increased turbidity in the area proximal to the drill collar location.

Environmental Protection Procedures

a) All drilling equipment on the Project site shall use only oils/lubricants that classify as “biodegradable” (see Section 5.13 for additional information on the use of biodegradable oils/lubricants);

b) Potential drilling sites shall be inspected and accepted by the On-Site Environmental Monitor prior to drilling proceeding;

c) The drill rig shall be inspected for mechanical soundness prior to mobilization to the drill site. Barges used to support drilling shall be inspected and approved

prior to drill mounting onto barge. Any drilling activities from a barge in the Churchill River require a request for project review to DFO. If a letter of advice is issued from DFO, all conditions shall be followed. The drill crew shall also keep a daily log of inspections and mechanical soundness of barge and drill. Daily logs shall note the general stability of the drill rig and overall assessment of the surrounding sea/river state;

d) Following the initial inspection and prior to each drill mobilization, the drill rig and barge shall be inspected by the On-Site Environmental Monitor for potential environmental risks;

e) All fuel, lubricants and other hydrocarbons shall be stored, handled and transported according to Section 5.13. Only necessary quantities shall be stored at the drill rig at any time;

f) A spill containment boom shall be deployed around the barge until it is removed from the drill site;

g) Disposal of drilling materials and all solid wastes shall be undertaken according to Section 5.15;

h) Drilling equipment shall have muffled exhaust to minimize noise;

i) Turbidity from the release of drill water shall be localized to the area of the drill site and shall cease after drilling is complete. Release of suspended solids shall be frequently monitored by the On-Site Environmental Monitor;

j) All discharges shall meet the Environmental Control Water and Sewer Regulations (ECWSR);

k) Operations shall be suspended when weather and flow conditions exceed the capabilities of the drill and moorings to operate in a safe and effective manner. Guidelines relating to drill and moorings performance capabilities shall be established by H&S Coordinators and/or On-Site Environmental Monitors in consultation with the drilling foreman;

l) All drill workers shall be familiar with oil spill response procedures (Traffic Services Centre, Oil Spill Report – at sea or on land: 1-800-563-9089). Spill response equipment shall be on the barge at all times. All fuel spills shall be handled in accordance with the Master Spill Response Plan; and

m) In the event of a spill, all drilling activity shall cease until clean up is performed. Priority in the event of a spill shall be the safety of all crewmembers.

5.12 SURFACE WATER AND GROUNDWATER USE

Groundwater and/or surface water may be extracted from wells or intake structures at different project areas including the accommodations complex, concrete batch plant, southside access road, security building and various construction camps.

Environmental Concerns

Environmental concerns associated with water wells include potential for saltwater intrusion, proximity to sources of contamination, and excessive drawdown at the aquifer. Environmental concerns associated with surface water use at the site include excessive removal of water and the potential effect on fish habitat.

Environmental Protection Procedures

a) Wells shall be developed in consultation with the DOEC Water Resources Management Division to avoid areas of groundwater constraint such as potential sources of contamination (septic fields, landfills, etc.), proximity of other wells, and seawater;

b) Water extraction rates shall be established, under approval of the Water Resources Management Division, to address concerns for drawdown or potential effects on the water table, and to ensure withdrawal from surface water bodies does not affect the natural flow regime and fish/fish habitat;

c) Water withdrawal shall be documented in the Water Withdrawal Form located in Section 8;

d) Applicable reference documents include *Freshwater Intake End-of-Pipe Fish Screen Guidelines*, *1995, Freshwater Intake End-of-Pipe Fish Screen Fact Sheet, Guidelines for the Protection of Freshwater Fish Habitat in Newfoundland and Labrador, 1998* and the *Policy for Allocation of Water Use W.R. 88-1 (rev1995);* and

e) If water withdrawal is required, a request for project review to DFO is required. If a letter of advice is issued from DFO, all conditions shall be followed. A water use license is also required from the Water Resources Management Division.

5.13 STORAGE, HANDLING, USE AND DISPOSAL OF FUEL AND OTHER HAZARDOUS MATERIALS

A variety of fuels and potentially hazardous materials will be used during Project construction activities. Gasoline, diesel fuel, grease, motor oil and hydraulic fluids are all needed for equipment. Other potentially hazardous materials, which may be routinely used, include but are not limited to:

- Propane;
- Explosives;
- Acetylene (i.e. welding);
- Oxygen;
- Paints;
- Epoxies;
- Concrete additives;
- Wood Treatments;
- Antifreeze; and
- Cleaners and solvents.

Environmental Concerns

The primary concern regarding the use of fuel and hazardous materials is their uncontrolled release to the environment through spillage, and the subsequent adverse effects on human health and safety, terrestrial, aquatic and marine habitat and species, soil, and groundwater quality.

Environmental Protection Procedures

5.13.1 General Practices

All fuel, hazardous and controlled product storage areas, including temporary and permanent fuelling and fuel storage facilities shall be designed in accordance with applicable codes and regulations.

The *Storage and Handling of Gasoline and Associated Products Regulations, 2003* (referred to as the "GAP Regulations") under the Environmental Protection Act controls the construction, operation, and registration of "storage tank systems"[1] in the province of Newfoundland and Labrador.

Information on storage tanks, storage tank systems, and equipment storage tanks proposed for use on the Project shall be provided for review. Tanks that are not already registered under GAP shall be evaluated on a case-by-case basis to determine if GAP Regulations apply. Tank registration shall be accompanied by any necessary regulatory variances.

In general, the GAP Regulations apply to all stationary storage tanks and storage tank systems except in the following cases:

a) Tanks with capacities of 2,500 litres or less that are connected to a heating appliance;

b) Tanks that are designed, constructed and utilized in the inherent operation of a piece of equipment. In this case, the tanks must be physically secured and dedicated to the equipment requiring the fuel for its operation; and

c) "Mobile" tanks (e.g. tank trucks and tank truck trailers) used for temporary, stationary storage. In this case storage period must not exceed 14 days and no additional fuel can be added to the tank. There must also be a minimum of 14 days of downtime between separate storage periods and there can be no more than two, 14 day storage periods within a 12 month time frame.

[1] The GAP Regulations defines "storage tank system" as an "… atmospheric or low pressure closed tank container and all vents, fill and withdrawal piping associated with it installed in a fixed location and includes temporary arrangement on cradles and skids".

Note that all provisions of the GAP Regulations, including registration, apply for all tanks associated with mobile generators.

Consideration for the design and construction of storage facilities shall include:

a) Contracted fuel suppliers shall comply with the Lower Churchill Project's P-WEPP. A C-SEPP shall be developed by the contractor, including contingency plans which shall require acceptance by the project. Before transporting or positioning fuel at the site the contractor shall read and accept the Master Spill Response Plan;

b) All fuel storage and handling shall be in compliance with *GAP Regulations.* Necessary registrations and variances shall be obtained from Service NL for storage facilities, as required;

c) The Master Spill Response Plan that contains information regarding spills of fuel and hazardous materials shall be kept on site near all fuel storage facilities (see Section 7 in addition to fuel suppliers contingency plans);

d) Any soil contaminated by small leaks of fuel, oil or grease from equipment (including hydraulic hose ruptures and loss of fluid) shall be disposed of as per policies and guidelines. For larger leaks and spills a disposal plan shall be developed and submitted to regu*l*ators for approval*;*

e) The *Used Oil Control Regulations* shall be used to determine requirements for the storage and disposal of used oil;

f) All equipment on the Project site shall use only oils/lubricants[2] that classify as "biodegradable"[3]; unless demonstrated by the contractor and accepted that it is not feasible because of:

   i) technical or performance constraints;

   ii) negative impacts on equipment warranties;

[2] For example: hydraulic oil; multipurpose lubricant; chain oil; form oil; gear oil; transmission fluid; differential fluid; rust proofing; heat transfer fluids; compressor fluid; saw guide oil; electrical insulating fluid; and grease.
[3] i.e. the product must be either "readily biodegradable"; or have inherent, primary biodegradability; or inherent, ultimate biodegradability, as defined by the *OECD 301 B: Ready Biodegradability Test* procedure.

iii) cost constraints; and/or

iv) unavailability of biodegradable oils and lubricants.

g) The Contractor shall document the consideration of this issue providing, as a minimum, the following information:

i) cost differential in using biodegradable and non-biodegradable oils and lubricants;

ii) life cycle cost differential for equipment maintenance and operation;

iii) product specifications indicating the product meets the definition of "biodegradable" when tested in accordance with the OECD 301B Ready Biodegradability Test procedure; or

iv) reasons (e.g. technical, market availability, equipment warranty provisions, etc) for not using biodegradable fluids, should that option be proposed.

h) Empty drums shall be stored and backhauled to nearest receiving community, as per the WMP. Bungs shall be inspected and tightened prior to shipping;

i) Contractors shall at all times maintain in good condition at least one spill kit dedicated to each piece of fuel-powered equipment. Each spill kit shall be located on the equipment and stored in a weather-proof container. Each spill kit shall have an absorption capacity of no less than 23 litres. Examples of acceptable spill kits with various absorption capacities are as follows:

23 Litre Absorption Capacity

- One (1) 10-liter bag Oclansorb®, or equivalent;
- Two (2) 4-mil heavy duty disposal plastic bag 762 mm x 1219.2 mm;
- One (1) steel hand spade;
- Two (2) 100 mm x 1200 mm Sorb Sox®, or equivalent;
- Five (5) sorbent pads 9.5 mm x 431.8 mm x 482.6 mm.

64 Litre Absorption Capacity

- One (1) 13-liter bag Oclansorb®, or equivalent;
- Ten (10) sorbent pads 9.5 mm x 431.8 mm x 482.6 mm or equivalent;
- Two (2) 4-mil yellow heavy duty disposal bag 762 mm x 1.2 m;
- One (1) steel hand spade;
- Two (2) 101.6 mm x 1.2 m Sorb Sox®, or equivalent;
- Two (2) 101.6 mm x 2.4 m Sorb Sox®, or equivalent;

121 liter Absorption Capacity

- Twenty five (25) sorbent pads 9.5 mm x 431.8 mm x 482.6 mm
- Ten (10) 4-mil yellow heavy duty disposal bag, 762 mm x 1219.2 mm:
- One (1) 44-liter bag Oclansorb®, or equivalent;
- Eight (8) Sorb Sox® 101.6 mm x 1.2 m, or equivalent;
- Five (5) Sorb Sox® 101.6 mm x 2.4 m, or equivalent;
- Two (2) Spillows® 50.8 mm x 431.8 mm x 482.6 mm, or equivalent;
- One (1) spark resistant poly-shovel;
- One (1) Sorb Sox® Boom 177.8 mm x 3 m, or equivalent; and
- One (1) Pair of chemical resistant gloves.

In addition to equipment-dedicated spill kits, the Contractor shall at all times maintain in good condition spill response caches that are accessible within 15 minutes travel of all work faces and within the immediate vicinity of fuel/hazardous materials storage areas. Each cache shall have sufficient absorption capacity for one thousand (1000) litres of fuel or hazardous liquids, and shall contain at a minimum the following:

- Forty (40) hazardous material socks 76.2 mm x 1.2 m;
- Twenty four (24) hazardous material socks 76.2 mm x 2.4 m;

- Sixty (60) Sorb Sox® 101.6 mm x 1.2 m, or equivalent;
- Sixteen (16) hazardous material pillows 457.2 mm x 457.2 mm;
- Eight (8) 44-liter bag Oclansorb®, or equivalent;
- Eight (8) 13-liter bag Oclansorb®, or equivalent;
- Four (4) 25-pound Qualisorb Gold #628, or equivalent;
- One hundred (100) hazard material pads 9.5 mm x 431.8 mm x 482.6 mm;
- One hundred twenty (120) Hi-Point Pads (9.5 mm x 431.8 mm x 482.6 mm), or equivalent;
- Four (4) Neoprene drain cover 914.4 mm v 914.4 mm x 3.2 mm;
- Four (4) 1-pound Container Gap Seal plugging compound;
- Four (4) spark resistant poly-shovels;
- Eight (8) pairs chemical resistant gloves;
- Eight (8) pairs splash goggles;
- Eight (8) pairs Tyvek coveralls;
- Fifty (50) 4-mil yellow heavy duty disposal bags 762 mm x 1219.2 mm;
- Two (2) plastic scoop and brush;
- Eight (8) steel hand spades; and
- Eight (8) 4-kg. Vytac ACX powder acid neutralizer with colour indicator and instructions (for battery acid spills), or equivalent;

Only trained, qualified persons shall handle fuels and other hazardous materials. The Workplace Hazardous Materials Information System (WHMIS) shall be implemented to ensure proper handling and storage is achieved. Operators shall be in attendance for the duration of all fuelling operations;

j) The Canadian Transport Emergency Centre (CANUTEC – 613-996-6666) operated by Transport Canada can assist emergency response personnel in handling dangerous goods emergencies.

k) Waste oils, lubricants, and other used oil shall be reused, recycled or disposed of at an approved, licensed waste management facility in accordance with the WMP (as per the *Used Oil Control Regulations, 2002* and the *Air Pollution Control Regulations, 2004)*;

l) Storage areas shall be equipped with firefighting equipment, in accordance with approvals;

m) Smoking shall be prohibited within 50 m of a fuel storage area; and

n) See Section 5.18 for specific information related to buffer zones required for fuel storage, equipment fuelling and fuel transfer activities.

5.13.2 Fuel Storage Requirements

a) Fuel storage tanks shall comply with *GAP Regulations* and shall be equipped with vacuum gauges and vent pipes, as applicable.

b) Waste oil storage tanks shall comply with the *Used Oil Control Regulations, 2002* (see Figure 5-4 for a typical waste oil tank);

c) All bulk fuel and waste oil storage (> 2000 L) shall be in tanks with suitable secondary containment (i.e. double walled, self dyked, lined, earthen dyke etc.);

Figure 5-4: Typical waste oil tank featuring vacuum gauges, vent pipe, etc.

d) Diesel fuel and gasoline to be used for refuelling purposes shall be stored in appropriate 20 L containers (i.e. yellow containers for diesel, red containers for gasoline). Containers shall be clearly identified stating container contents;

e) A letter of consent shall be obtained from designated officials of the Service NL for fuel caches of 10 or more 205 L drums (including helicopter fuel caches). A letter of consent is not required for fuel caches under 10 drums;

f) A marker stake or flag shall be required for a petroleum products storage site of less than 10 x 205 L drums;

g) Boundary poles or posts with colourful flags or a painted marker shall be required for temporary petroleum product sites of 10 to 100 x 205 L drums;

h) Fuels stored inside dykes or self-dyked units shall be clearly marked to ensure they are not damaged by moving vehicles and are visible under all weather conditions. Dykes and barriers shall be designed and constructed in accordance with the *GAP Regulations* (see Figures 5-5 and 5-6 for typical dyked and concrete pad methods for tank installation);

i) Used oil shall be stored in an appropriate storage tank meeting the requirement of Sections 18 and 21 of the *Used Oil Control Regulations*;

j) Used oil can be stored in a 205 L drum as long as the drum is:

   i) clearly marked "used oil";

   ii) made of 18 gauge steel;

   iii) stored in an area providing secondary containment;

   iv) equipped with sufficient size openings to prevent spillage during filling or emptying;

   v) equipped with venting if they are intended to be vacuumed out; and

   vi) in compliance with CAN/GSSB-43.150-95 if they are to be transported by road.

k) All used oil tanks shall be inspected on a regular basis as per Section 24 of the *Used Oil Control Regulation.* All fuel storage tank systems shall be inspected on a regular basis as per Sections 20 and 21 of the *GAP Regulations*. This involves, but is not limited to, gauging or dipping and the keeping of reconciliation records for the duration of the program.

Figure 5-5: Acceptable fuel storage with dykes

Figure 5-6: Fuel storage on concrete pad

5.13.3 Fuel Transfer

The following procedures shall apply to the transfer of fuel or hazardous material:

a) In all cases, a qualified person shall attend the transfer to storage tanks, for the duration of the operation. This person shall be trained in proper fuel handling procedures to minimize the risk of a spill. The attendant shall be trained in the requirements of the fuel suppliers approved Spill Contingency Plan, Master Spill Response Plan (MSRP) and Workplace Hazardous Materials Information System (WHMIS);

b) Hoses or pipes used for fuel transfer shall be equipped with properly functioning and approved check valves, spaced to prevent backflow of fuel in the case of failures;

c) All tanks shall be dipped before and after filling;

d) Fuel transfers between ship and shore or between ships shall be conducted in accordance with the *Canada Shipping Act, Oil Pollution Prevention Regulations;*

e) Exposed pipelines shall be protected from vehicular collision damage by the installation of guardrails; and

f) Exposed "ship to shore" fuel transfer lines shall be clearly flagged from the shoreline to the receiving fuel tank to prevent traffic collision during transfer operations.

5.13.4 Equipment Fuelling and Lubrication

The following procedures shall apply to the fuelling of heavy construction equipment:

a) Fuelling and lubrication of equipment shall occur in such a manner as to minimize the possibility of contamination to soil or water;

b) When refuelling equipment, operators shall:

   i) Use leak-free containers and reinforced rip and puncture-proof hoses and nozzles;

   ii) Be in attendance for the duration of the operation; and

   iii) Seal all storage container outlets except the outlet currently in use.

c) Regular inspections shall be performed on the hydraulic and fuel systems of machinery. Leaks shall be repaired immediately;

d) Fuelling or servicing of mobile equipment on land shall not be allowed within 30 m of watercourses or waterbodies, except in designated areas with dewatering pumps; and

e) Fuelling attendants shall be trained in the requirements under the contractors Spill Contingency Plan in the C-SEPP and the MSRP.

5.13.5 Hazardous Materials

The following procedures shall apply to the use of hazardous materials:

a) Hazardous materials shall be used only by personnel who are trained and qualified in the handling of these materials and only in accordance with manufacturers' instructions and government regulations. WHMIS and the provisions of the *Transportation of Dangerous Goods Act* shall be implemented throughout the job site. All employees involved with hazardous materials shall be appropriately trained;

b) All hazardous wastes shall be stored, removed and disposed of in accordance with the WMP (as per government regulations and applicable permits);

c) Material Safety Data Sheets (MSDS) must be available on-site prior to receipt of any hazardous materials;

d) A hazardous waste storage area shall be constructed and properly marked. A permit may be required for construction of this area; and

e) Hazardous waste shall not be permitted to be poured down drains, oil/water separators, septic systems or discharged into the environment in any form.

5.13.5.1 Wood Treatment

The following standards shall apply to the use of wood preservatives on the site:

a) Creosote shall not be used on the site.

b) In Protected Water Supply Areas:

i. Treated wood products shall not be used in protected water supply areas;

ii. Where written justification for treated wood is presented, for the use in protected water supply areas, for acceptance, the treatment options shall be restricted to chromated copper arsenate (CCA), ammonical copper arsenate (ACA), ammoniacal copper zinc arsenate (ACZA), pentachlorophenol (PCP), or copper naphthenate (CuN);

iii. Table 5-2 below specifies the required buffer zones separating water bodies (within protected water supply areas) from locations where treated wood products, including poles, are to be used;

Table 5-2: Buffer Zones for Placement of Treated Wood within a Water Supply Area

Body of Water	Width of Buffer Zone
Pond/Lake	150 m (for pond/lake intake structures)
River	150 m for a distance of 1 km upstream and 100 m downstream of river intake structures
Main River Channel	75 m
Major Tributaries/Lakes/Ponds	50 m
Other bodies of water	30 m

iv. If structures are required within these specified buffer zones, then only untreated wood, steel or concrete shall be used; and

v. If wood poles are required within the buffer zones outlined in Table 1, but untreated wood poles are not practical or feasible, alternative protective measures may be used however, regulatory approval for such alternative measures shall be required. Specific techniques used to eliminate or minimize environmental disturbance shall be applied as appropriate.

c) Saltwater and Freshwater Areas (other than Protected Water Supply Areas):

i. In areas of low water hardness (i.e., 15-25 mg/L-1 $CaCO_3$), pH 5.5 or less, and elevated background metals levels, or areas where metals-sensitive biota exist, ACA, ACZA and CCA shall not be used;

ii. Pentachlorophenol shall not be used in salt water environments;

iii. For temporary installation of wood structures (i.e. bridge abutments or wood poles) within 15 metres of a water body only untreated timber shall be used;

iv. For permanent installations, non-invasive materials such as concrete or steel shall be used;

v. If use of untreated wood or alternative materials is not feasible or practical, approval by regulators is required prior to use of CCA, ACA, PCP and CuN; and

vi. Protective measures outlined above under Protected Water Supply Areas shall be considered; however, using these alternatives requires preapproval by regulatory agencies.

5.13.6 Spills and Leaks of Fuel and Hazardous Materials

The following procedures shall apply to the Spills of Fuel and Hazardous Materials:

a) All necessary precautions shall be implemented to prevent the spillage and leakage of fuels and other hazardous materials used during the construction phase;

b) All spills of fuel and hazardous materials shall be reported immediately to the On-Site Environmental Monitor. In the event of a spill refer to the Master Spill Response Plan; and

c) A copy of the Master Spill Response Plan shall be present on site and in the event of a spill the outlined procedures shall be followed.

5.14 SEWAGE DISPOSAL

All sewage disposal activities shall comply with Newfoundland and Labrador's *Health and Community Services Act, 1997* and the *Environmental Control Water and Sewage Regulations, 2003* under the *Water Resources Act, 2003.*

Environmental Concerns

The accidental release of untreated sewage is a concern to human health, drinking water quality, and freshwater and marine ecosystems. This applies to effluent from a sewage treatment system that does not meet the limit set in Schedule A of the *Environmental Control Water and Sewage Regulations, 2003.*

Environmental Protection Procedures

a) Development of sewage treatment facilities shall be undertaken in consultation with the relevant regulatory agencies for a temporary or permanent sewage collection system, and a Certificate of Approval shall be obtained from the Service NL and/or the DOEC;

b) The health inspector with the Service NL is the approval authority for sewage flows under 1000 gallons. The general sanitization of the site is under the jurisdiction of the health inspector who shall perform periodic inspections;

c) All sewage disposal activities shall comply with Section 36(3) of the Fisheries Act.

d) For septic systems, the location of a tile field shall be clearly marked and vehicular traffic shall not be permitted to operate within this defined boundary; and

e) Portable washrooms and toilets used at the Lower Churchill Project site shall be routinely inspected and properly maintained by their owners or by the Project as determined by the WMP. Sewage sludge removed from the facilities shall be transported off site for approved treatment and disposal. Companies engaged to perform this work must have approval from the Service NL and/or DOEC. Copies of government approvals must be provided to the On-Site Environmental

Monitor before work can proceed. All human sanitary waste must be contained and disposed in a manner that meets all environmental and health requirements. Any concerns must be brought to the immediate attention of the On-Site Environmental Monitors and H&S Coordinator.

5.15 SOLID WASTE DISPOSAL

Environmental Concerns

Solid waste (e.g. construction waste, domestic waste, paper, cardboard, and wood), if not properly controlled and disposed of, can be unsightly, may cause human safety and health concerns, and could negatively affect wildlife.

Environmental Protection Procedures

a) A Waste Management Plan for Component 1 and 4b is in place to address waste generation, handling, storage and disposal during construction. The WMP includes methods for waste stream separation, collection, storage, transport, disposal and associated schedules. Any procedures or strategies for management of solid waste shall also be in accordance with the Provincial Waste Management Strategy;

b) Waste management at the site shall comply with all provisions of the WMP;

c) Waste material shall not be deposited in a body of water; and

d) Waste material shall not be deposited anywhere except at a facility or site approved to accept that specific type of waste.

5.16 WORKING WITHIN 15 METRES OF A BODY OF WATER

Environmental Concerns

Working close to water bodies poses a risk of introducing contaminants into the aquatic ecosystem, affecting fish, fish habitat, and other receptors, and affecting the natural flow regime of the water body. Contaminants such as sediment, petroleum hydrocarbons, and other deleterious substances may impact fish, wildlife, plants, and human receptors. Proper protection plans are required to minimize or eliminate sedimentation and water pollution and maintain riparian habitat near water bodies.

Environmental Protection Procedures

Mitigation measures provided in various sections (e.g. Section 5.25 - Erosion Prevention and Sediment Control, Section 5.13 - Storage, Handling and Disposal of Fuel and Other Hazardous Material, Section 5.18 - Buffer Zones, etc) shall be consulted to ensure that appropriate measures are understood and implemented during the course of construction. Work within 15m of a body of water requires a permit under section 48 of the *Water Resources Act.*

In addition, the following steps shall be taken to ensure protection of water bodies:

a) A joint engineering and environmental reconnaissance of the site shall be completed in the early planning stages to identify all nearby bodies of water and mitigation and protective measures shall be identified;

b) Where possible, the majority of construction works shall take place during low flow and low rainfall period;

c) Any vehicles or equipment working near a body of water shall be clean and in good condition;

d) Heavy equipment shall be kept outside the high water mark of all bodies of water, where possible; and

e) All equipment on the Project site shall use only oils/lubricants that classify as “biodegradable” where feasible (see Section 5.13 for additional information on the use of biodegradable oils/lubricants).

5.17 WATERCOURSE CROSSINGS – FORDING, CULVERTS AND BRIDGES

Environmental Concerns

The environmental concerns associated with fording, culvert installations, bridge construction and maintenance include direct disturbance to, or mortality of, fish, disturbance to waterfowl, loss of fish habitat caused by sedimentation and removal of substrate, and disturbances to stream bank vegetation.

Environmental Protection Procedures

Erosion stabilization methods and effective sedimentation control practices shall be implemented when required (Section 5.25), and these shall conform to requirements, guidelines, and principles contained in DFO FactSheets, Operational Statements, DOEC Environmental Guidelines, and specific requirements of regulatory permits and approvals.

All watercourse crossings (fording, culvert installation and bridge crossings) shall comply with permits issued by DOEC. In addition, a notification form or a request for project review to DFO are required. If a letter of advice is issued for Works and Undertakings Affecting Fish Habitat from DFO, all conditions shall be followed.

The following measures shall be implemented to minimize negative effects of watercourse crossings:

a) Attention shall be given to scheduling in order to minimize the time the watercourse is disturbed and therefore minimize the sediment entering the watercourse. The ideal time for construction is during low flow and low rainfall period;

b) Any alterations to a body of water which may impact navigation shall require a Navigable Waters Permit Application under *Navigable Waters Protection Act (NWPA)* request for project review under NWPA from Transport Canada (TC). If a NWPA authorization is issued, the conditions shall be adhered to;

c) Any alterations to a body of water which may impact water quality shall require a DOEC permit(s) under the *Water Resources Act;*

d) Watercourse crossing construction activities, in areas of fish habitat, shall be undertaken in accordance with DFO requirements and under the direct guidance of the On-Site Environmental Monitor;

e) All water courses and bodies of water shall be examined by the On-Site Environmental Monitor or sub-contractors on a site-specific basis in order to evaluate each watercourse crossing (including upstream and downstream);

f) Work shall be performed in such a way as to ensure that materials such as sediment, fuel and oil do not enter watercourses and water bodies;

g) The banks and flood plains of watercourses must be adequately protected from erosion using an applicable erosion prevention method as outlined in Section 5.25, Erosion Prevention and Sediment Control;

h) A suitable buffer (Section 5.18) of undisturbed natural vegetation shall be left between the access road and the bank of any adjacent watercourse, unless otherwise specified. The typical buffer width shall be determined in consultation with the On-Site Environmental Monitor according to the following formula:

Buffer width (m) = 20 m + 1.5 x slope (%) (where slope >30%);

i) The buffer width for reservoir clearing shall be 15 m (slope distance); and

j) See Section 5.18 for buffer widths related to temporary fuelling services or washing of equipment near watercourses or waterbodies.

Fording

When fording any watercourse, the DOEC Environmental Guidelines for Fording and the DFO fact sheet for Temporary Fording Sites shall be followed in conjunction with the following:

a) Areas of known or suspected spawning habitat shall be avoided;

b) Where feasible, crossings shall be restricted to a single location and made at right angles to the watercourse;

c) Equipment activity within the watercourse shall be minimized by limiting the number of crossings;

d) All equipment shall be clean and mechanically sound to avoid the introduction of oil, gasoline, and hydraulic fluids to waterbodies;

e) No servicing or washing of heavy equipment shall occur adjacent to a watercourse, waterbody, or ecologically sensitive area. These areas shall be identified on constraint mapping and shall be identified in the field by the On-Site Environmental Monitor;

f) Where the ford area is not natural bedrock or is easily disturbed by fording, the entire fording area shall be stabilized using vegetation mats, corduroy roads or coarse material (125 mm diameter or greater) when such material is available from a reasonably close location within the right-of-way; when the substrate of the ford area is not subject to easy disturbance by fording or coarse material is not easily available within the right-of-way, fording under existing substrate conditions may occur under the guidance of the On-Site Environmental Monitor;

g) Fording activities shall not decrease the depth of the watercourses to less than 20 cm. Where the existing depth is less than 20 cm, that depth shall be maintained;

h) Photographs of all ford sites shall be taken prior to and after the fording has been completed. The On-Site Environmental Monitor shall be responsible for collecting these photographs;

i) Waterbodies shall not be forded during high flow periods;

j) All bank sections which contain erodible materials shall be stabilized or avoided if possible; if banks must be sloped for stabilization, no material shall be deposited within the watercourse; sloping shall be accomplished by back-blading and the material shall be deposited above the high water mark of the watercourse; and

k) Proposed fording activities on waterbodies or water courses visible on 1:50,000 scale maps shall require a permit from DOEC.

Culverts

In those locations where installations or upgrading of existing culverts are required, permits are required from DOEC. In addition a request for project review to DFO may be required. If a letter of advice is issued from DFO, all conditions shall be followed.

The culverts used shall be sized to handle the 1-in-100 year return period flood (however design criteria may vary depending on site-specific conditions and the length of time a culvert will be used (i.e. temporary vs. permanent)) and shall be constructed in accordance with the DOEC Environmental Guidelines for Watercourse Crossings and Culverts and the DFO operational statement for Culvert Maintenance as well as the DFO fact sheets for Culvert Installations. The following measures shall also be implemented:

Installation of Culverts

a) Install culvert(s) in accordance with good engineering and environmental practice. Photographs of culvert installation are shown as Figures 5-7 and 5-8;

b) Proposed culvert installations on water courses visible on a 1:50,000 scale map shall require a permit from DOEC;

c) Unless otherwise indicated, all work shall take place in dry conditions, either by the use of cofferdams or by diverting the stream with pumps and hoses. All work involving major alterations to stream channels shall be carried out at a time of low flow, in a manner that prevents downstream sedimentation;

d) Cylindrical culverts shall be counter sunk when installed in fish habitat (as recommended by DFO) such that the culvert bottom is one-third the diameter below the streambed in the case of culverts less than 750 mm outside diameter; for culverts greater than 750 mm outside diameter, the culvert bottom shall be installed a minimum of 300 mm below the streambed;

e) If two culverts are to be installed at one location, one culvert shall be installed at an elevation lower than the other one. A maximum of two culverts are allowed at one location;

f) The natural low flow regime of the watercourse shall not be altered; culverts shall not disrupt flow of water or cause ponding at the upstream side of the installation;

g) A culvert shall not be installed before site-specific information such as localized stream gradient, fish habitat type and species present have been evaluated, as required;

h) When rock energy dissipaters are utilized at culvert outlets, proper fish passage shall be ensured;

i) Photographs of all culvert installations shall be taken prior to and after the installation has been completed. The On-Site Environmental Monitor shall be responsible for collecting these photographs;

j) Inlet and outlet areas shall be adequately protected from erosion by installing erosion prevention structures as outlined in Section 5.25, Erosion Prevention and Sediment Control;

k) Culverts shall be of sufficient length to extend a short distance beyond the toe of the fill material;

l) Backfill material shall be of texture that shall support the culvert and limit seepage and subsequent washing out;

m) Culverts shall be aligned such that the original direction of stream flow is not significantly altered and the gradient at the culvert follows the stream channel gradient to the extent possible. Infilling or reduction of the natural cross-sectional area of the watercourse shall not be permitted;

n) Fill and construction debris shall be removed from the culvert area to a location above the peak flow level to prevent its entry into the watercourse;

o) Construction activity shall be confined to the immediate area of the culvert;

p) Fill material shall not be removed from streambeds or banks except when removal of material is necessary to ensure a flat foundation for installing a culvert;

q) The use of heavy equipment in watercourses or bodies of water shall not be permitted;

r) Culverts shall be marked to indicate their position under the snow;

s) As required, cofferdams of non-erodible material shall be installed above and below work areas to separate them from the watercourse when excavating for culverts and footings. All sandbags used in construction must be accounted for and removed after work is completed. Where pumping is used to bypass flow, pumps shall have sufficient capacity to prevent washout of the cofferdams. Refer to DFOs fact sheet for Instream Work in the Dry – Cofferdams;

t) Cofferdams shall be removed upon completion of construction and the streambed returned as closely as possible to its original condition;

u) Water pumped from work areas or other runoff must have sediment and turbidity removed by settling ponds, filtration, or other suitable means before discharging to a waterbody;

v) The release of sediment laden water into a waterbody, watercourse or ecologically sensitive area, due to construction activities, shall comply with applicable discharge guidelines as presented in the *Newfoundland and Labrador Environmental Control Water and Sewage Regulations, 2003* under *the Water Resources Act;*

w) With respect to maintenance of water quality within receiving waterbodies on and around the site, the *CCME Canadian Water Quality Guidelines for the Protection of Aquatic Life* shall be used; and

x) Culvert installations shall not require a DFO review when the following conditions are met (unless the culvert installations are within fish habitat):

i) the work does not include realigning the watercourse, installing a culvert liner or support struts, replacing damaged or destroyed bevels ends, or extending/replacing the existing culvert;

ii) explosives are not used to remove debris; and

iii) the work does not include any dredging, infilling (e.g., filling scour pools) or excavation of the channel upstream or downstream of the culvert.

Culvert Upgrading/Maintenance

Culvert maintenance includes the removal of accumulated debris (e.g., logs, boulders, garbage, ice build-up) that prevents the efficient passage of water and fish through the structure and well as reinforcement of eroding inlets and outlets. The following measures shall be implemented when upgrading/maintaining culverts:

a) In locations where upgrading and/or alterations are required for existing culvert at the site, the mitigation measures listed above for installation of a culvert shall be reviewed and followed, as applicable;

b) Culverts shall be inspected regularly so that immediate action can be taken to clear blockages caused by ice or debris and to identify any apparent problems, such as erosion, which may require remedial action;

c) An inspection of culverts shall be made during and after major floods to observe the culvert operation and record high water marks. Conditions which require corrective maintenance shall be noted including debris accumulations, sedimentation, erosion, piping, scour, and structural damage and reported if applicable;

d) Culverts which have been damaged by ice or debris, by improper installation or construction procedures, or are in a condition which could impair their proper functioning shall be replaced immediately to prevent overtopping, erosion, or flooding;

e) Access for maintenance shall be provided, especially where debris control structures are installed. Such access shall not disrupt the site rehabilitation efforts; and

f) During rehabilitation activities following the end of construction, culverts within the flood zone (below LSL) may be left in place and flooded during reservoir impoundment. Culverts above the LSL shall be removed.

Figure 5-7: Example of well installed culvert

Figure 5-8: Example of culvert installation

Bridges

a) Environmental protection measures outlined above which are applicable to bridge construction and maintenance shall be adhered to;

b) Any proposed bridge installations require a permit from DOEC. In addition, a request for project review or project notification to DFO is required. If a letter of advice is issued from DFO, all conditions shall be followed;

c) Photographs of all bridge installations shall be taken prior to and after the installation has been completed. The On-Site Environmental Monitor shall be responsible for collecting these photographs;

d) During bridge construction all applicable guidelines shall be adhered to including but not limited to: DOEC Environmental Guidelines for Bridges and Watercourse

Crossings, DFO Clear Span Bridges Operational Statement, DFO Fact Sheet for Temporary Bridges, and DFO Fact Sheet for Bridge Construction/Demolition;

e) To safely convey peak flows, permanent bridges shall be designed for a 100-year return period stream flow;

f) Temporary bridges shall consider the following basic design criteria:

   i) Hydraulic design shall be based on the 1:2 year storm event;

   ii) Abutment logs shall be placed a minimum of 1 meter from the top of the bank;

   iii) Deck height shall be a minimum of 250 cm above the bank height; and

   iv) Deck height shall be a minimum of 450 cm above the water surface at the time of installation.

g) Each installation shall take into consideration site-specific conditions and appropriate criteria shall be accepted by the On-Site Environmental Monitor;

h) The upstream and downstream sides of abutments must be protected with erosion prevention structures as outlined in Section 5.25, Erosion Prevention and Sediment Control, to prevent erosion and scouring;

i) Roadside embankments near the watercourse shall be adequately protected from erosion by installing applicable erosion prevention structures as outlined in Section 5.25;

j) Adequate erosion protection as per Section 5.25 Erosion Prevention and Sediment Control shall be provided where roadside ditches discharge into the watercourse near the bridge;

k) Abutments and piers shall be constructed in the dry and where possible during times of low flow;

l) During construction of concrete components, formwork shall be constructed to prevent any fresh concrete from entering bodies of water. Dumping of concrete or washing of tools and equipment in any body of water is prohibited;

m) Periodic maintenance such as painting, resurfacing, clearing of debris, or minor repairs, shall be carried out without causing any physical disruption of the watercourse. Care shall be taken to prevent spillage of pollutants into the water;

n) All waste materials shall be disposed of in accordance with the WMP;

o) All areas affected shall be returned to a state that resembles local natural conditions; and

p) During rehabilitation activities following the end of construction, all temporary bridges shall be removed.

5.18 BUFFER ZONES

Environmental Concerns

The potential for erosion/sedimentation, spills, etc. and resulting effects on water quality, fish and fish habitat is a key environmental concern associated with construction activities. In addition, sensitive and rare environmental receptors (e.g. Osprey nesting sites, archaeological/historic resources, etc) require protection from activities associated with construction.

Buffer zones of natural vegetation or undisturbed areas that separate these environmental receptors from construction activities are needed to mitigate adverse environmental effects. These undisturbed areas may also provide wildlife habitat and/or travel corridors near work areas and Project features.

Due to the many buffer zones referenced in various government documents and others that may be stated in regulatory permits yet to be obtained, the appropriate buffer zone to use in a specific area may vary over time. Therefore, the On-Site Environmental Monitor shall be the only site-based personnel to determine which buffer is applicable, and contractors shall be required to consult with these individuals prior to establishing buffers. For general guidance, however, the following procedures shall define the minimum requirements during construction.

Environmental Protection Procedures

a) DFO recommends buffer zones to separate areas of land disturbance/roadways from water bodies shall be calculated by the following formula:

Buffer Width (m) = 20 m + 1.5 x slope (%) (where slope >30%);

b) A minimum 15 m (slope distance) vegetation buffer shall be maintained for reservoir clearing;

c) A minimum buffer zone of natural vegetation 20 m from the high water mark of waterbodies, watercourses and ecologically sensitive areas shall be maintained around work areas where available space poses a constraint, except where

specified otherwise. If the available space allows, then wider buffer zones of 100 m shall be maintained between construction areas and watercourses, waterbodies and ecologically sensitive areas (Figure 5-9 shows a typical buffer zone being protected by tarp fencing);

Figure 5-9: Tarp fence outlining a vegetation buffer zone

d) Sediment control devices shall be constructed outside buffer zones as required. This is required to control runoff from areas of exposed soils and prevent transport of sediments towards water bodies. Section 5.25, Erosion Prevention and Sediment Control outlines all acceptable sediment control measures;

e) All aircraft must maintain a 300 m vertical and horizontal buffer from known active raptor nests between May 15 to August 15;

f) No clearing shall take place within 800 m of an active raptor nest between the months of May 15 to August 15;

g) For all work activities other than clearing, a 200 m buffer shall be respected for active raptor nests from May 15 to August 15. Within this 200 m buffer zone the following applies, after consultation with the provincial government:

   i) Only essential vehicular activity shall be permitted;

   ii) Work shall only be permitted in the presence of the On-Site Environmental

Monitor; and

iii) Crews shall cease work if there is a disturbance at a nest until activity at the nest has returned to normal; work shall not commence again until approval from the On-Site Environmental Monitor.

h) Crews shall not establish a permanent or temporary camp within 800 m of a known raptor nest;

i) Locations along the Churchill River are known as spring and fall staging areas for waterfowl and harlequin ducks. Helicopters moving through these areas during this time (typically May or September) shall maintain a minimum altitude of 500 m from concentrations of waterfowl and harlequin ducks;

j) For known harlequin duck nesting areas, a 100 m buffer of natural vegetation shall be maintained along the river's edge during their breeding, nesting and staging times (May through September). A 30 m buffer shall be maintained outside the sensitive nesting season. Clearing and construction within these buffers during this time shall not occur unless otherwise authorized;

k) Buffer zones for other bird species not indicated in this document are outlined in the Avifauna Management Plan and shall be respected;

l) A minimum buffer zone of 100 m shall be maintained from the high water mark of waterbodies, watercourses and ecologically sensitive areas around any bulk fuel storage activities;

m) The typical buffer zone for quarries and borrow pits in relation to a water body is 100 m. In some instances the development of quarries and borrow pits shall be allowed within this 100 m buffer zone, however applicable permits from regulators shall be required, as well as consultation with the On-Site Environmental Co-ordinator;

n) A minimum buffer zone of 50 m shall be maintained around any archaeological site. The size of buffer zones may increase or decrease depending on the type of site and the buffer zone may be revised based on direction from the Provincial

Archaeology Office (PAO). Where the site has been designated for recovery and/or recording the buffer zone shall be maintained until it has been cleared by the On-Site Environmental Monitor. Where available space poses constraints, this width may be reduced and supplemented by other protective measures. Site-specific mitigative measures for known historic resources in the Project area are addressed within Section 5.32.1; and

o) Buffers for working around caribou are outlined in Section 5.32.3.

Figure 5-10 provides a summary of recommended buffer zones for the handling and storage of fuels and other hazardous products. Table 5-3 provides a summary of all buffer zones.

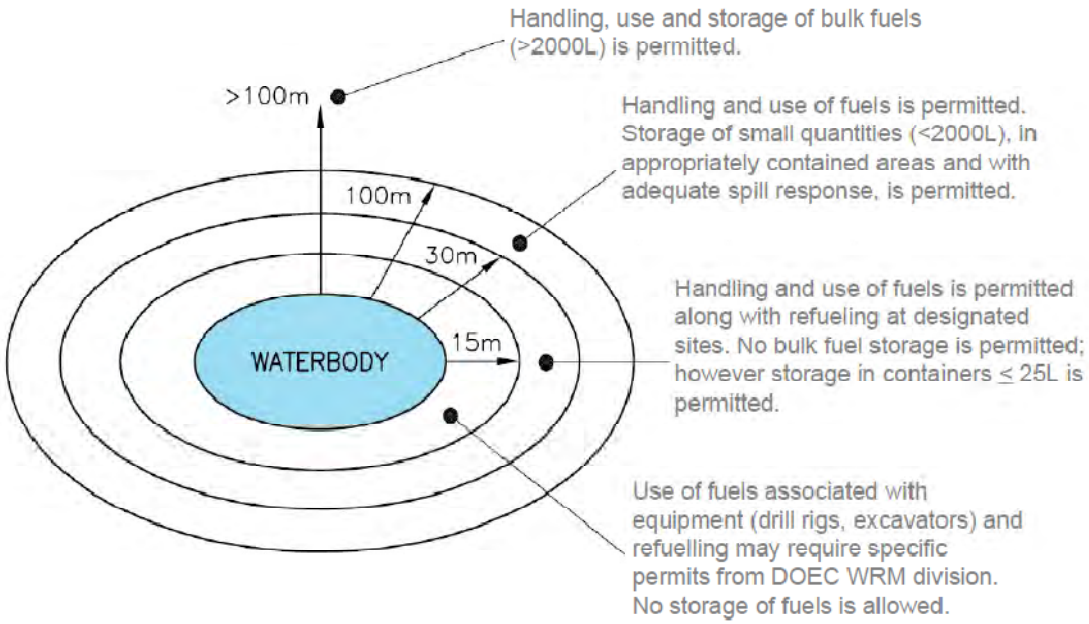

Figure 5-10: Required Buffer Zones from a water body (for fuel activities)

Table 5-3: Recommended Buffer Strips for Various Activities

Activity	Environmental Receptor	Recommended Width (m) of Buffer Strip
Handling, use and storage of bulk fuels (> 2000 L)	Waterbody	100 m
Storage and handling of small quantities (<2000 L) of fuel in appropriately contained areas and with adequate spill response	Water body	30 m
Handling and use of fuels (including transfer and fuelling of equipment). Storage of fuel in containers ≤25 L	Waterbody	15 m
Linear Developments/ Clearing of Vegetation	Waterbody	20 m (+1.5 x slope (%) where >30%) 15 m buffer for reservoir clearing
	Active Raptor Nests	800 m (between May 15 – August 15)
Other Work Activities	Active Raptor Nests	200 m (between May 15 – August 15)
Aircrafts	Active Raptor Nests	300 m (vertical and horizontal)
	Waterfowl and Harlequin Duck Concentrations	500 m vertical distance
Quarrying and Aggregate Removal from Borrow Areas	Waterbody	100 m
All Activities	Archaeological sites	50 m
Cutting	Scheduled Salmon Rivers	50 m*

Activity	Environmental Receptor	Recommended Width (m) of Buffer Strip
Cutting	Black Bear Denning Sites (Late October – Late April)	50 m*
Cutting/Construction	Harlequin Duck	100 m* during nesting, breeding and molting seasons (Early May through September) 30 m* outside the sensitive time
Cutting/Construction	Active waterfowl/waterbird nests (species not of management concern)	100 m
Cutting/Construction	Active passerine nests (species not of management concern)	30 m
Cutting	Waterbody occupied by a beaver	30 m*

*** Buffer zone widths may vary once cutting permits are obtained.**

5.19 ALTERATIONS TO A BODY OF WATER/ INSTREAM WORKS

Environmental Concerns

The environmental concerns associated with alterations to a body of water include direct disturbance to, or mortality of, fish, disturbance to waterfowl, loss of fish habitat caused by sedimentation and removal of substrate, and disturbance to stream bank vegetation. Typical alterations to a body of water include fording, bridges and culverts however other less common alterations include cofferdams, pumping and stream diversions. Fording, bridges and culverts have been discussed in subsequent sections therefore this section shall concentrate on cofferdams, pumping and stream diversions.

Environmental Protection Procedures

a) Any work within 15 m of a water body visible on a 1:50,000 scale map shall require a permit from DOEC. A request for project review shall be submitted to DFO. If a letter of advice is issued by DFO, the conditions of the letter shall be adhered to;

b) Erosion stabilization methods and effective sedimentation control practices shall be implemented when required, and these shall conform to requirements, guidelines, and principles contained in DFO FactSheets, Operational Statements, DOEC Environmental Guidelines and specific requirements of regulatory permits and approvals;

c) Two cofferdams or a square type structure shall be used for best results. The first cofferdam shall be upstream of the construction area and shall keep the construction area dry and provide a basin for water to be pumped. The second cofferdam shall be downstream of the construction area and shall prevent any sediment laden water that may have accumulated in the construction area from discharging directly into the watercourse;

d) Pumping the water shall commence prior to starting intrusive work to prevent the river from being silted as water passes the work area. When a watercourse is too large to divert by other measures, part of the river may be blocked off to allow work to take place in dry conditions. One third the width of the watercourse or less shall be blocked at any time in order to ensure efficient remaining capacity in the channel to safely accommodate flow without causing excessive high velocity, erosion or overtopping of banks. A dewatering plan shall be developed prior to dewatering activities;

e) An alternative means of isolating the work area shall be to construct a temporary diversion channel lined with plastic sheeting or an impermeable material. The channel shall be designed to handle the predicted flows of the watercourse. Figure 5-11 shows typical cofferdam usage in a river and Figure 5-12 illustrates the usage of a stream diversion coupled with cofferdams;

Figure 5-11: Cofferdams surrounding work area

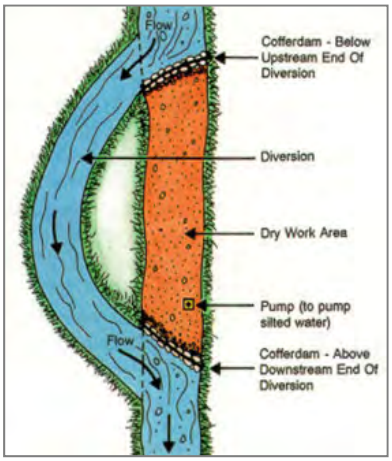

Figure 5-12: Illustration of stream diversion and cofferdams

f) Floating silt curtains or suitable alternative shall be used to contain and control the dispersion of turbidity and sediment when working in or near a waterbody;

g) The curtain shall be located beyond the lateral limits of the construction site; the alignment shall be as close as possible to the activities but not so close as to be disturbed by the construction equipment;

h) The curtain shall be firmly anchored in place by posts; and

i) The contractor shall remove built up sediment and debris as required; if the fabric becomes clogged it shall be replaced.

Fish Habitat and Relocation

a) A license to conduct fish sampling/collection permits shall be obtained from DFO prior to any sampling, collection or relocation activities;

b) The waterbody shall be de-watered using a screened pump which shall be deployed on a floating structure near the deepest portion of the pond/river. The pump shall be monitored during all de-watering. The water shall be directed to a vegetated area so that any sediment carried by the pump shall be further filtered through vegetation before reaching another water body. The pumped water and the screen shall be monitored for fish during all pumping. Optimally, the isolated section of river shall be reduced to a small containment area capable of being electrofished/ seined by boat;

c) If soft sediment moves toward the deeper part of the area during draw-down, this will effectively reduce the size of the area and shall require careful monitoring of water levels so that too much water is not removed hence trapping all fish in a thick layer of sediment;

d) Electrofishing inside the small containment area left after de-watering shall be conducted by a small boat so as to reduce the amount of sediment disturbance. Other techniques shall be available should electrofishing become inefficient due to increased sediment disturbance (e.g. seining and/or casting net). The boat shall be of a non-conducting material so that the electrofisher will not short out (e.g. zodiac, fibreglass/plastic canoe). A second small boat shall be used to transport any captured fish to shore so that disturbance of bottom sediment is

minimized. This boat shall be moved between the shore and collection boat by ropes. This may be modified in the field as necessary;

e) Water temperature will be another critical factor in successful relocation of all fish, as the reduced pond will warm relatively quickly. Optimally, it would be desirable to begin collection of fish in the early morning hours. Coordination of the draw-down shall be conducted to ensure this can occur. Water temperature shall be monitored continually and any exceedance of the Experimental License requirement shall mean a stop in collection, is required. However, this may be a field-call as pausing once the isolated section of river is reduced may cause more harm than completing the relocation. This situation shall be avoided;

f) Monitoring shall include recording water temperatures, dissolved oxygen levels, pH, and visual observations of stress and/or overcrowding. If signs of stress and/or overcrowding are observed, additional measures may be required that will be developed and followed by Nalcor. These additional measures will be provided to DFO in a Fish Stranding/Relocation Plan for their review, prior to the initiation of any dewatering activities (including infilling of the Diversion Head Pond).

g) Once the isolated section of river has been de-watered, the small containment area shall be electrofished, seined, and/or netted to remove any remaining fish;

h) All fish shall be contained in 20 litre buckets for transport to the release point. Each bucket shall be relocated once five fish are exceeded or thirty minutes have passed so that stress is avoided;

i) All fish shall be acclimatized prior to release. Each bucket shall be laid into the receiving water so that water temperatures between both are equal (measured using thermometers). Once acclimated, fish shall be released;

j) An estimate of the length of each fish shall be obtained in order to calculate the total weight of the fish;

k) Experienced personnel shall be responsible for capture and release of the fish. The person responsible for capture shall be familiar with all equipment and shall be able to adjust the voltage on the electrofisher as water levels and conductivities change. They shall also be able to detect signs of fish stress. The person responsible for fish release shall be experienced in acclimating fish and monitoring their health. They shall also be able to estimate fish species and lengths; and

l) If dewatering is required as part of the execution of work, a dewatering plan shall be developed as part of the C-SEPP.

5.20 WORK IN/AROUND MARINE ENVIRONMENT

Environmental Concern

The principle environmental concerns from marine construction include the release of fines, hazardous liquids, and toxic substances to the water and substrate, and disturbance to fish and fish habitat. Marine construction activities can also disturb nearshore terrestrial habitat and cause seabirds, waterfowl and marine mammals to avoid the area.

Environmental Protection Procedures

a) Work in and around the marine environment shall require a permit for the Alteration of a Waterbody under the *Newfoundland and Labrador Water Resources Act*, and the *Federal Navigable Waters Protection Act.* In addition a request for project review to DFO may be required for infilling. If a letter of advice is issued from DFO, all conditions shall be followed;

b) Clean blasted rock shall be used for infilling. Armour stone protection shall be placed progressively to minimize erosion and to prevent the loss of infill material. All blasted material shall be taken from an approved quarry site;

c) The operation of heavy equipment shall be confined to dry, stable areas or approved barges;

d) Infilling shall be done in compliance with the *Navigable Waters Protection Act* authorization;

e) Any timber cribbing used for construction of temporary or permanent structures shall consist of untreated wood (or preservatives safe for the marine environment);

f) Sedimentation prevention methods as outlined in Section 5.25, Erosion Prevention and Sediment Control shall be used where appropriate to control sedimentation into the marine environment during infilling;

g) Refer to Section 5.19 for silt control procedures in water works;

h) All equipment shall have muffled exhausts to minimize noise;

i) Fuelling of equipment shall follow the buffers outlined in the Buffer Zone section (Section 5.18);

j) All vehicles shall be clean and in good repairs. Regular mechanical inspections for leaks on all equipment shall be made and repairs undertaken immediately; and

k) The Master Spill Response Plan and appropriate spill kits for equipment shall be available on-site (see Section 5.13).

5.21 GRUBBING AND DISPOSAL OF RELATED DEBRIS

Environmental Concerns

The principal concerns associated with grubbing and disposal of related debris are the potential effects of erosion and sedimentation on marine and freshwater ecosystems and water quality.

Environmental Protection Procedures

All grubbing and disposal of related debris near watercourses shall adhere to relevant regulatory requirements, including the permits from DOEC and the formal "Letters of Advice", "Operational Statements", and/or Authorizations for Works or Undertakings Affecting Fish Habitat from the Fisheries and Oceans Canada.

Other specific measures to be undertaken to minimize potential effects on aquatic habitat and resources are as follows:

a) Grubbing activities shall be limited to only those areas that are required for Project development;

b) Grubbing of the organic vegetation mat and/or the upper soil horizons shall be minimized. These shall be left in place where possible. Limits of stripping and/or grubbing shall be shown on all drawings issued for construction;

c) The organic vegetation mat and upper soil horizon material, which has been grubbed, shall be spread in a manner that attempts to cover exposed areas. Any surplus material shall be stored or stockpiled for site rehabilitation and revegetation purposes elsewhere in the Project area. Topsoil and peat shall be stockpiled separately from the overburden and separated by a buffer zone (Section 5.18) from any waterbodies, watercourse or ecologically sensitive areas. The location of the stockpiles shall be shown on drawings issued for construction and accessible for future rehabilitation purposes;

d) A minimum of 5 metres should separate stockpiles of grubbed material from standing timber;

e) Grubbed material and/or topsoil shall be stored in low piles to decrease the effect of compaction on structure. Stockpiles of topsoil should be seeded or otherwise protected using erosion control methods as outlined in Section 5.25, Erosion Prevention and Sediment Control to prevent erosion and loss of nutrients. This is especially important if stockpiles are to remain in place for periods of a year or more;

f) Overburden and topsoil from grubbing activities shall be stored, and stabilized, for the purpose of future rehabilitation;

g) Erosion prevention and sediment control measures shall be installed to minimize and control runoff soil erosion and transport of sediment laden water during grubbing and the re-spreading and stockpiling of grubbed materials. Section 5.25, Erosion Prevention and Sediment Control outlines all acceptable prevention and control methods (i.e. use of sediment ponds);

h) Where grubbed materials are re-spread or stockpiled; as many stumps and roots as possible shall be left in place to maintain soil cohesion, to dissipate the energy of runoff, and promote natural re-vegetation;

i) The length of time that grubbed areas are left exposed to the natural elements shall be minimized to prevent unnecessary erosion. These areas shall be monitored for erosion and such findings shall be reported to the On-Site Environmental Monitor;

j) During grubbing, care shall be taken to ensure that grubbed material shall not be pushed into areas that are to be left undisturbed (Figures 5-14 and 5-15 show examples of grubbing activities and a grubbed right-of-way);

k) Grubbing shall be avoided on steep slopes near watercourses. A buffer zone shall be maintained between grubbed areas and watercourses, waterbodies and ecologically sensitive areas (Section 5.18). Grubbing limits adjacent to watercourses shall be flagged in the field prior to undertaking grubbing/stripping activities;

l) Grubbing and other debris shall not be permitted to enter any watercourse;

m) Bog and other wet material that is excavated from the site shall be piled and graded on well drained ground in low piles. The piles shall be seeded or otherwise protected using erosion control methods as outlined in Section 5.25, Erosion Prevention and Sediment Control; and

n) Where the piles are in the transmission line right-of-way they shall not impede access to the line for future maintenance or access.

Figure 5-13: Example of grubbing activities

Figure 5-14: Example of grubbed and cleared path

5.22 QUARRYING AND AGGREGATE REMOVAL FROM BORROW AREAS

Environmental Concerns

The principle concerns for quarry development and associated aggregate removal include the potential for impacts on aquatic systems, loss of terrestrial habitat and historic resources, potential quarry development/rehabilitation plans.

Environmental Protection Procedures

The following measures shall be implemented to minimize these effects:

a) Permits to quarry shall be obtained from the NL Department of Natural Resources before quarries are established. Quarry activity shall be undertaken in compliance with these quarry permits and shall comply with all other relevant regulations;

b) Quarries shall be located 100 m from a water body unless otherwise approved by the Department of Natural Resources. If approved, additional mitigative measures may be required;

c) The development of quarry sites and rock excavations shall require monitoring to determine the absence or presence of sulphide bearing rock. For environmental protection against Acid Rock Drainage (ARD), the On-Site Environmental Monitor shall visually inspect bedrock before, during, and after excavation work on a periodic basis. Previous surveys have indicated that materials at the site are Not Potentially Acid Generating (NPAG), however in the event that visible evidence of ARD is noted, the On-Site Environmental Monitor shall be notified immediately. Visible evidence of ARD is typically a yellowish colour of water or sediment called yellow boy or evidence or sulphides in rock. Photographs of yellow boy and sulphides (Figures 5-16 – 5-19) are shown below;

Figure 5-15: Photograph of Yellow Boy water run-off

Figure 5-16: Photograph of Yellow Boy water run-off

Figure 5-17: Typical sulphides in rock

Figure 5-18: Typical sulphides in rock

d) Quarry areas shall be developed in a controlled manner so as to minimize potential environmental effects and quarry locations shall consider sensitive wildlife areas. The following protection procedures shall be implemented to minimize disturbance and facilitate rehabilitation:

   i) A buffer zone of undisturbed vegetation shall be maintained between borrow areas/quarries and watercourses, waterbodies and ecologically sensitive areas (see Section 5.18);

ii) The quarry area, stockpile area and limits of clearing shall be staked and/or flagged to prevent over-extension of the development, (corner posts at least 1 metre high above ground shall be installed to mark the quarry area);

iii) The area to be excavated shall be clear cut of all vegetation prior to grubbing, excavation or removal of any material. Only the area necessary for one year's production shall be cleared;

iv) All stumps, organic matter and topsoil shall be stripped from the area to be excavated and stockpiled at least 5 m from uncleared areas; stockpiles shall be kept at least 10 m from the area of excavation; separate overburden piles shall be developed where this material is present; topsoil and the underlying overburden shall not be mixed (Section 5.21);

v) Stockpile areas are to be confirmed by the On-Site Environmental Monitor, prior to stripping;

vi) Upon completion of excavation of a quarry, no cliff faces or benches shall be left at a height of greater than 5 m. Available material left over from quarrying and stockpiled overburden shall be used to minimize slopes and face heights and to rehabilitate the area (Section 5.35);

vii) Each quarry shall be evaluated by the On-Site Environmental Monitor on a site-specific basis to determine whether the cliff faces shall be converted to rubble slopes; and

viii) Following sloping, the topsoil and any organic materials shall be re-spread over the disturbed area to promote natural re-vegetation by adjacent seed sources (5.35).

e) In order to prevent sedimentation of waterbodies, watercourses and ecologically sensitive areas, sediment control measures (basins and traps) shall be established, if required, and cleaned on a regular basis, as required, to ensure

that the retention capacity is maintained at all times. Section 5.25, Erosion Prevention and Sediment Control outlines all acceptable sediment control measures;

f) The Total Suspended Solid (TSS) content of construction-altered water that is released into a natural waterbody shall not exceed 30 milligrams per litre[4] and be in compliance with *Environmental Control Water and Sewage Regulations, 2003;*

g) With respect to maintenance of water quality within receiving waterbodies on and around the site, the *CCME Canadian Water Quality Guidelines for the Protection of Aquatic Life* shall be used;

h) The pH level of construction-altered water that is released into a natural waterbody shall be between 5.5 and 9 pH units and be in compliance with *Environmental Control Water and Sewage Regulations, 2003*;

i) Dust from aggregate processing, storage and handling shall be controlled with water as required during times when temperatures are above freezing. A water use license must be obtained from DOEC; and

j) If crushing activities in the quarry require a water source, A water use license is also required from the Water Resources Management Division; Quarry operations shall consider sensitive wildlife periods as outlined in Section 5.1.

[4] If water is being abstracted from a water course, used, treated and subsequently returned to the same water course, these solids data mean that the effluent should not contain more than 30 milligrams per litre more than was in the water originally abstracted.

5.23 TRENCHING

Environmental Concerns

Where linear excavations for the construction of water lines or any other infrastructure is undertaken, potential runoff of sediment-laden water could result in effects on marine or freshwater fish and fish habitat, water quality and historic resources.

Environmental Protection Procedures

The following measures shall be implemented to minimize the potential effects of trenching:

a) Topsoil and excavated overburden and bedrock shall be stored in separate stockpiles for later use during rehabilitation;

b) Any unsuitable material shall be disposed of in a disposal area to be confirmed by the On-Site Environmental Monitor;

c) Dewatering of trenches, as outlined in Section 5.27 shall make use of measures to minimize and control the release of sediment laden water through the use of acceptable sediment control measures as outlined in Section 5.25, Erosion Prevention and Sediment Control; and

d) Backfilling of linear trenches shall allow for settlement to ensure that the finished grade of the trench is level with the surrounding surface.

5.24 EXCAVATION, BACKFILLING AND GRADING

Excavation, backfilling and grading of common rock and other materials may be required at various locations within the Project site.

Environmental Concerns

The principal environmental concerns associated with excavation, backfilling and grading are potential effects on water quality and fish and fish habitat due to run-off of sediment laden water. Potential disturbance to rare species and habitat and archaeological resources must also be taken into account.

Environmental Protection Procedures

All work shall be conducted in a manner that ensures the minimum amount of disturbance necessary and controls potential sedimentation of watercourses and waterbodies in or adjacent to the work areas as outlined in the following procedures:

a) Excavation, backfilling and grading shall be done only after grubbing and stripping is completed. Where engineering requirements do not require grubbing and stripping (e.g., within the buffer zone of a stream crossing), filling shall occur without any disturbance of the vegetation mat or the upper soil horizons;

b) Excavation, backfilling and grading in the vicinity of stream crossings shall be done in a manner that minimizes erosion and sedimentation of watercourses and water bodies; and

c) A buffer zone of undisturbed vegetation shall be maintained between construction areas and all watercourses, waterbodies and ecologically sensitive areas (Section 5.18).

5.25 EROSION PREVENTION AND SEDIMENT CONTROL

Environmental Concerns

The potential for erosion and resulting effects to water quality and fish and fish habitat is a key environmental concern associated with construction activities. Figures 5-20 and 5-21 show sediment run-off situations that can be avoided by following the environmental protective measures herein.

Figure 5-19. Sediment plume in water

Figure 5-20. Sedimentation on land

Environmental Protection Procedures

Erosion prevention and sedimentation control shall be a main objective in all work areas where soil may be transported by water, wind, or ice. An Erosion and Sedimentation Control Plan shall be prepared and submitted by the Contractor as part of the C-SEPP, prior to the start of site activities.

Storm water discharge into any water body showing on 1:50,000 mapping shall require a DOEC permit under the Water Resources Act.

5.25.1 Site-Specific Erosion and Sedimentation Control Plan

The following outlines the requirements of the Erosion and Sedimentation Control Plan:

a) A brief description of the proposed land disturbing activities, existing site conditions and adjacent areas;

b) A description of the critical areas on the site (i.e. areas that have a potential for serious erosion problems);

c) Construction schedule that includes the date stripping and grading will begin and the expected date of stabilization;

d) A brief description of the measures that shall be used to minimize erosion and control sedimentation on the site including types, options, when they shall be installed and where they shall be located;

e) An inspection and maintenance program including frequency of inspection and repair, clean out and disposal of trapped sediment, duration and final rehabilitation when site work is complete;

f) Shut down plans where construction plans are delayed for an extended period of time;

g) An emergency response plan that identified available short term resources in terms of personnel, equipment and erosion and sedimentation control measures and reporting steps;

h) Name of person preparing plan and professional stamp/designation;

i) Site plan including the following features:

   i) Existing and final site contours at an interval and scale sufficient to identify runoff patterns before and after disturbance;

   ii) Existing vegetation and buffers;

   iii) Limits of clearing and grading;

   iv) Critical areas; and

   v) Location and type of erosion and sedimentation control measures with dimensions.

j) Detailed drawings of all erosion and sedimentation control structures and measures showing dimensions, material and other important details;

k) The following calculations:

i) Design calculations for erosion and sedimentation control measures (culverts, channels, sediment traps, etc.) such as particle size, flow rates and peak discharge;

ii) Calculations to demonstrate the design of sediment removal efficiency; and

iii) Any other calculations, as required.

l) Contingency measures shall be implemented to deal with storm events and high run-off in order to minimize adverse environmental effects from these events. Erosion prevention and sediment containment measures and required equipment shall be available to address contingency/emergency situations.

5.25.2 Erosion Prevention

The primary way to control erosion is to prevent activities that can contribute to it. However, specific erosion control measures may be required to be designed for the site to minimize the effects of construction activities on the environment. Options for erosion prevention are discussed in the following sections.

5.25.2.1 Discussion of Erosion Control Options

Slope Treatments

Several slope treatments can be used to reduce erosion. Slope treatments are used prior to seeding for vegetation growth. Roughening a slope with horizontal depressions helps control erosion by creating safe seeding sites therefore increasing vegetation, reducing runoff velocity, and increasing infiltration. The depressions also trap sediment on the face of the slope. The amount of roughening required depends on the steepness of the slope and the type of soil. Stable, sloping rocky faces may not require roughening or stabilization, while erodible slopes require special surface

roughening. Roughening methods include stair-step grading, grooving, and tracking. All three methods are shown in Figures 5-22 to 5-24.

Figure 5-21: Photograph of grooving slope treatment method

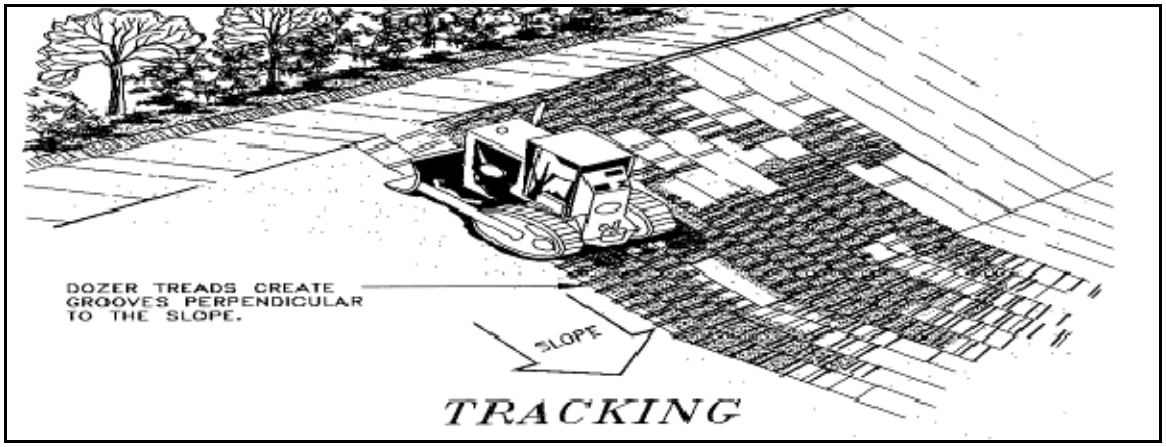

Figure 5-22: Illustration of tracking slope treatment method

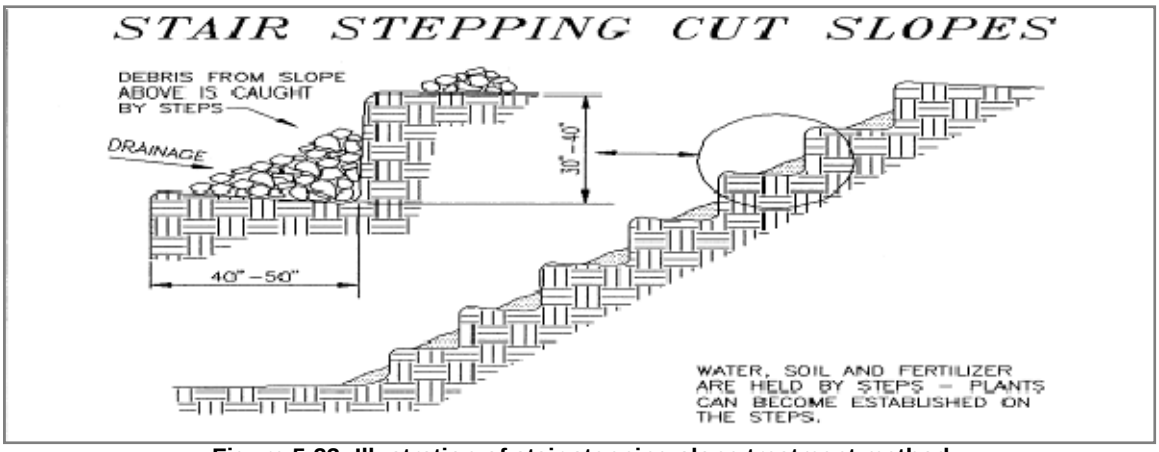

Figure 5-23: Illustration of stair stepping slope treatment method

Erosion Control Nets/Mats/Blankets/Fibrous Rolls

Erosion control blankets are temporary protective barriers laid on top of bare soil vulnerable to erosion, commonly made of mulch, wood fibre, straw or synthetics. They are typically used on short steep slopes where there is a high erosion potential and slow vegetation establishment. Rolled Erosion Control Products (RECPs) are manufactured mulch blankets (see Figure 5-25) that protect soil from erosion and Turf Reinforcement Mats (TRMs) are used to help establish vegetation in channels.

Figure 5-24: Photograph of Erosion Control Blanket used on a slope

Erosion control nets are typically synthetic textiles or nets that degrade over time. The nets are woven to permit plants to take root through the holes in them. They also act as a medium to retain water for longer period of time. Different grade of nets are used based on the topography of the ground. The more closely knit nets can be used to curtail erosion in high slope areas, while the more loosely knit nets can be used in flatter terrain. Installation of erosion control mats and blankets shall take into consideration the criteria listed in Section 5.25.2.2.

Fibre rolls serve as barriers between up gradient construction and downgradient water bodies. Fibre rolls are installed on slopes in line with one another with one at the base of the slope. The space between each row of fibre roll is dependent on the steepness of the slope. The steeper the slope, the more rows of evenly spaced horizontal rows of rolls is needed. Fibre rolls are fastened to the ground with wooden stakes. Figures 5-26 and 5-27 show some of the methods of erosion control.

Figure 5-25: Photograph of Fibre Rolls used to stabilize

Figure 5-26: Photograph shows erosion control blanket on slope and erosion control mat in channel

Rip Rap

Rip rap can be used as an erosion-resistant ground cover and when installed properly it reduces the velocity of runoff and increases infiltration. Rip rap typically works well on river banks and/or bottoms, roadside ditches and tops of slopes. A non-woven geo-textile liner should be used at the top of the channel to prevent migration of fines. Rip rap placement shall follow criteria listed in Section 5.25.2.2 and applicable construction specifications and drawings. Figure 5-28 shows properly placed rip rap while Figure 5-29 shows poorly placed rip rap with geotextile exposed.

Figure 5-27: Photograph of Rip Rap placed along a slope

Figure 5-28: Photograph of failed Rip Rap Protection

Check Dams and Dikes

Check dams and dikes are temporary barriers that are typically constructed of rocks, gravel bags, sandbags or fibre rolls that are installed across a constructed swale or drainage ditch to reduce the velocity of water. They are placed in areas where runoff erosion has occurred or where runoff needs to be diverted or channelled. They are not designed to stop the water, but to slow it down. Check dam and dyke installation shall follow the criteria listed in Section 5.25.2.2 and applicable construction specifications and drawings.

Check dams shall be maintained and inspected periodically as well as unscheduled inspections prior to, and after, a significant rainfall event, anticipated heavy precipitation or runoff event (e.g. snow melt). Removal of sediment from check dams shall be conducted as required, in order that the check dam continues to perform its function of reducing the amount of sediment present in the run-off. Photographs of rock constructed check dams are shown below in Figures 5-30 and 5-31.

Figure 5-29: Photograph of Rock Constructed Check Dam

Figure 5-30: Photograph of a Rock Constructed Dike

Energy Dissipaters

Energy dissipaters (or outlet protection devices) are devices that are installed on the downstream end of a culvert or outlet and are used to reduce the velocity of the water flow. Energy dissipaters are typically made of rocks (rip rap apron); however they can be man-made devices such as concrete blocks or metal prongs. Energy dissipaters required for fish bearing waters shall be of natural means (not man-made). Energy dissipaters require engineering design to accommodate the velocity and volume of flow and shall follow the criteria listed in Section 5.25.2.2 and applicable construction specifications and drawings. Figure 5-32 shows properly constructed or placed energy dissipaters while Figure 5-33 shows improperly placed rocks as energy dissipaters.

Figure 5-31: Correct Construction of Rock Energy Dissipaters

Figure 5-32: Incorrect Construction of Rock Energy Dissipaters

5.25.2.2 Design Criteria and Installation Procedures for Erosion Control Measures

Design criteria and installation procedures for applicable options discussed above are listed below. Reference shall be made to these criteria if either of these options is deemed suitable for site-specific conditions.

Straw Mats

a) Straw mats shall be applied at a rate of 3000 to 8000 lb/acre;

b) Soil shall be visible through the straw mat (not too heavily applied);

c) Straw shall be applied by blower or by hand; and

d) Straw shall be anchored to prevent it from blowing away.

Wood Fibre Mulch

a) Preferable on steep cut slopes of 2H:1V or steeper; and

b) Wood fibre mulch shall be applied at a rate of at least 1000 lb/acre (increasing the rate of application will increase effectiveness).

Rolled Erosion Control Products (RECPs)

a) May be used for gradients of 2.5H:1V or steeper;

b) Shall be installed on unfrozen ground;

c) Slopes shall be top soiled and seeded prior to placing RECP;

d) Blankets shall be in full contact with the soil by properly grading soil, removing rocks or deleterious materials, prior to placing blanket;

e) In channels, blankets shall extend above the anticipated flow height, with a minimum 0.5 m of free board;

f) For turf reinforcement mat (TRM), blanket shall be placed immediately after top soiling;

g) Blanket shall be anchored by using wire staples, metal geotextile stake pins, or triangular wooden stakes; and

h) Blankets shall be placed longitudinal to direction of flow, with fabric not stretched but maintaining contact with underlying soil.

Rolled Erosion Control Products (RECPs) on Slopes

General Installation Methods for RECPs on slopes are listed below however all installation shall be designed on a site-specific basis and products shall be installed according to manufacturers procedures.

a) Prepare surface and place topsoil and seed (surface should be smooth and free of rocks, debris, or other deleterious materials);

b) Blanket shall be anchored at top of slope in a minimum 0.15 m by 0.15 m trench for the entire width of the blanket;

c) The blanket shall be rolled out downslope;

d) Where the blanket roll is not long enough to cover the entire length of the slope, a minimum 0.15 m by 0.15 m check slot shall be excavated at the location of the

lap, and the downslope segment of blanket anchored in the check slot, similar to the method used for the top of the slope, or (2) when blankets, must be spliced down the slope, place blanket end over end (shingle style) with approximately 0.10 m overlap. Staple through overlapped area at 0.3 m intervals;

e) The upslope portion of blanket shall overlap the downslope portion of blanket, shingle style, at least 0.15 m with staple anchors placed a maximum 0.3 m apart;

f) Adjacent rolls of blanket shall overlap a minimum 0.1 m;

g) Anchors shall be placed along central portion of blanket spaced at 4/m2 minimum (0.5 m spacing) for slopes steeper than 2H:1V and 1/m² (1 m spacing) for slopes flatter than 2H:1V; and

h) Anchors along splices between adjacent rolls shall be placed 0.9 m apart.

Rolled Erosion Control Products (RECPs) in Channels

General Installation Methods for RECPs in channels are listed below however all installation shall be designed on a site-specific basis and products shall be installed according to manufacturers procedures.

a) Prepare surface and place topsoil and seed (surface should be smooth and free of large rocks, debris, or other deleterious materials);

b) Excavate a minimum 0.15 m deep and 0.15 m wide trench at the upstream end of channel and place end of RECP into trench;

c) Use a double row of staggered anchors approximately 0.1 m apart (i.e. 0.2 m linear spacing) to secure RECP to soil in base of trench;

d) Backfill and compact soil over RECP in trench;

e) Roll centre RECP in direction of water flow on base of channel;

f) Place RECP end over end (shingle style) with a minimum 0.15 m overlap downgrade;

g) Use a double row of staggered anchors approximately 0.1 m apart to secure RECP to soil;

h) Full length edge of RECP at top of sideslopes shall be anchored in a minimum 0.15 m deep and 0.15 m wide trench;

i) Use a double row of staggered staple anchors a maximum of 0.1 m apart (i.e. 0.2 m linear spacing) to secure RECP to soil in base of trench;

j) Backfill and compact soil over RECP in trench;

k) Overlap RECP on side slopes (shingle style down channel) a minimum of 0.1 m over the centre RECP and secure RECP to soil with anchors spaced a maximum of 0.2 m apart;

l) In high flow channels, a check slot across the width of the channel is recommended at a maximum spacing of 10 m to anchor the ends of the RECP to the underlying soil;

m) Use a double row of staggered staple anchors a maximum of 0.1 m apart (0.2 m linear spacing) to secure RECP to soil in base of check slot; and

n) Backfill and compact soil over RECP in check slot.

Rip Rap

The following criteria shall be considered when installing a check dam:

a) Used for grades 5-15%;

b) It shall be constructed of durable, large, loose stone;

c) A non-woven geo-textile liner shall be used at the top of the channel to prevent migration of fines;

d) Side slopes of rip rap must be a slope of IV:3H or less;

e) Rip rap shall be of angular stone; and

f) Rip rap depth shall be at least 300mm and 1.5x the maximum stone diameter.

Check Dams and Dikes

The following criteria are to be considered when installing a check dam:

a) Check dams shall not be used in live streams or in channels with extended base flows, as this may have a detrimental effect on fish or fish habitats;

b) The check dam sediment trap shall consist of rock fill with filter fabric on the upstream face held in place with small shot rock;

c) Accumulated sediment shall be cleaned out of the filter fabric at regular intervals as required and the material shall be disposed of so that it cannot subsequently run into any waterbodies containing fish;

d) Any damaged section(s) of filter fabric as well as any undercut or end flow areas where water flows freely around the filter fabrics shall be repaired or replaced;

e) Drainage area shall be less than 4 ha;

f) The filter fabric shall be of a weight of at least 200g/m^2;

g) The rock fill shall be clean rock, with rock fragments sized between 100 and 150mm;

h) The small shot rock shall be clean rock, with fragments no larger than 120mm;

i) When used in series, the top of the downstream check dam shall be level with the bottom of the next dam upstream;

j) The check dam shall extend beyond the top of the ditch banks and the centerline elevation shall be low enough that flow does not go around the structure; and

k) Check dams shall be maintained and inspected periodically as well as unscheduled inspections prior to, and after, a significant rainfall event, anticipated heavy precipitation or runoff event (e.g. snow melt). The following maintenance shall be completed, as required:

    i) remove any accumulations of sediment; and

ii) add or remove rock as necessary to maintain design height, cross-section and flow through characteristics.

Energy Dissipaters

The following criteria are to be considered when installing energy dissipaters:

a) Energy dissipaters are preferably constructed on level grade for a distance which is related to the outlet flow rate and the tail water level;

b) The sill or transition to the natural channel shall be level with and at the same slope as the receiving channel;

c) Energy dissipaters are applicable for small and medium size culverts of any cross section where the depth of flow at the outlet is less than the culvert height;

d) For rip rap aprons, the apron width at the pipe end shall be 3x the pipe diameter;

e) Energy dissipaters shall drain by gravity when not in operation; and

f) Energy dissipaters shall be self cleaning and require minimum maintenance.

5.25.3 Sedimentation Prevention

5.25.3.1 Silt Fences/Sediment Barriers

Sediment barriers are temporary sediment control devices that are used to protect water quality of down gradient rivers, streams and other water bodies from sediment in water run-off. The most common barriers are silt fences; however other options include straw or hay bales or a berm of erosion control mix. Silt fences are typically used in combination with other site water control measures including sediment traps and basins. Engineering requirements may vary depending on the locations of the silt fence and shall take such factors into consideration as drainage/surface area of exposed soils and time of year the silt fence is employed.

Silt fences typically consist of a piece of synthetic filter fabric stretched between a series of wooden stakes. The stakes are installed on the downhill side of the fence, and the bottom edge of the fabric is trenched into the soil and backfilled on the uphill

side. The storm water passes through the fence and sediment is deposited on the uphill side of the fence.

Silt fences are suitable for sheet runoff from exposed areas of soil with grades less than 5% as a result of construction activities. The following criteria shall be taken into consideration when installing silt fences:

a) The silt fence shall consist of a filter fabric fence held in place by posts;

b) The woven filter fabric shall be of a weight of at least 200 g/m^2;

c) No single run of silt fence shall exceed 100 m in length;

d) The drainage area behind the silt fence shall not exceed 0.1 ha per 30 meters of fence;

e) Silt fences shall not be installed on a slope, and be located no nearer than 1 m from the toe of slope;

f) Silt fences shall not be used when the overland flow exceeds 0.03 m^3/sec;

g) The fabric shall be at least 900mm wide/high;

h) The fence posts shall be of sufficient length to support the fabric, be sturdy and be of dimensions of at least 50mm square;

i) The staples shall be sufficiently sturdy to support the fabric for the required life of the fence;

j) The posts shall be secured at 3m intervals on the immediate down slope side of the trench;

k) The filter fabric shall be taken from a continuous roll, and cut to the required length. The maximum length of the filter fabric shall be stapled to the upstream side of the stakes, with 200mm of fabric extending into the trench and spread over the trench bottom;

l) When installing a silt fence in frozen earth or rock, metals posts shall be used and wire ties shall be used to attach the filter fabric (Figure 5-36);

m) When a fence is installed in frozen earth it shall be checked and potentially replaced during spring melt as the posts may have shifted with the melting earth; and

n) Silt fences shall be removed when the site has been stabilized, or re-vegetated

Silt fences shall be inspected and maintained on a regular basis as well as before any anticipated heavy precipitation or runoff event (e.g. snow melt). Accumulation of sediment shall be periodically removed and disposed of in an area where it shall not re-enter any waterbody.

Also, repairs and replacement of damaged silt fences shall be addressed immediately. Figures 5-34 to 5-36 show proper construction of silt fences and Figures 5-37 and 5-38 show poorly constructed silt fences that have failed and allowed silt or silty water to pass through.

Figure 5-33: A well constructed silt fence

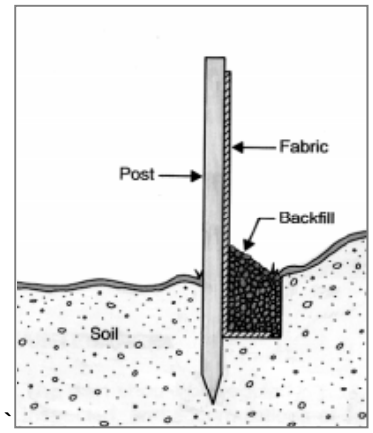

Figure 5-34: Properly constructed silt fence

Figure 5-36: Examples of poorly installed silt fences

Figure 5-37: Examples of poorly installed silt fences

5.26 SITE WATER MANAGEMENT

Environmental Concerns

For a large-scale, earth-moving construction projects such as the Lower Churchill Project, a major consideration in the protection of water quality and aquatic resources is the management of site water run-off and associated suspended solids. The protection of water quality and aquatic resources shall focus on prevention, containment and treatment of water and wastewater associated with the site. Site water management can be divided into three main categories: Surface Water Interception, Containment and Treatment.

Environmental Protection Procedures

The main focus of measures to protect water quality and aquatic resources is prevention. Preventative measures shall include measures to reduce the volume of water entering the work sites (thereby reducing the volume of water that requires subsequent containment and treatment). Site water management systems shall be installed as per technical specifications and/or the C-SEPPs. See references such as DFO's Fact Sheets on Ditching, Filter Fabric, Rock Check Dams and Temporary Settling Basins for more information related to erosion prevention and sedimentation control.

Storm water discharge into any water body showing on 1:50,000 mapping shall require a DOEC permit under the *Section 48 of the Water Resources Act*. Effluent monitoring locations, frequency, sampling and reporting shall comply with the conditions of the permit.

5.26.1 Description of Site Water Management Methods

Surface Water Interception

Reducing the amount of water entering the work sites through surface water runoff, infiltration through the cofferdams and groundwater seepage may be required. At the main work sites ditches shall be incorporated into the site layout to intercept surface

water and divert it around the work areas. Infiltration through the cofferdams and groundwater seepage shall be reduced by the installation of a properly designed sump and pump well systems that shall draw down the water table.

Containment

Once in the work areas, water shall be contained until the water can be treated and released. A system of ditches and drains, incorporated with sump and pump systems, may be required to handle water that enters all excavations. Where required, ditches, drains and sumps shall be located along the lower boundaries of the construction sites to intercept and contain silty or sediment laden water. Measures to contain water from excavations and other construction works shall include but not be limited to:

a) The containment of water from concrete production and placement, including the cutting of concrete, washing of forms or water otherwise contaminated by concrete components or admixtures;

b) The containment of wash water from the cleaning of mixers and mixer trucks;

c) The control of sediment and run-off from aggregate washing areas. This may include, but shall not be limited to, use of a closed system washing operation or a multiple tiered settling basin system; and

d) Testing and treatment for elevated levels of TSS or other contaminants related to blasting (such as Ammonium Nitrate and fuel oil).

Treatment (Sediment Ponds/Traps)

Once contained, water shall undergo testing and if necessary treatment prior to release. The goal of site water management is to release water within regulatory limits for all parameters. Water shall be tested for oil and grease, TSS, ammonium nitrates and/or any other parameters outlined by the monitoring plan in the C-SEPP based on usage of equipment and site chemicals as required to meet the *Environmental Control Water and Sewage Regulations, 2003.*

For open excavations, a system of properly designed and constructed settling basins is the preferred method of sediment removal. A sediment basin (also called a sediment pond – See Figure 5-39) is a temporary pond built on a construction site to capture eroded or disturbed soil that is transported due to water run-off. The sediment basin protects the water quality of down gradient water bodies. The sediment suspended in the water settles in the pond before the runoff is discharged. Sediment basins are typically used on larger construction sites (>5 acres). Use of sediment basins is usually in conjunction with other sediment and erosion controls. Reference the DFO Fact Sheet for Temporary Settling (Detention) Basins for more information.

Figure 5-38: Sediment Basin

A sediment trap is similar to a sediment basin and is basically an embankment built along a waterway or low-lying area on the site. Sediment traps should be installed prior to construction and earth moving activities and are commonly used on smaller construction sites, where a sediment basin is not practical. Use of sediment traps is usually in conjunction with other sediment and erosion controls. The size of sediment traps and basins shall depend on the size of the site, location and rainfall runoff for the area. See Figure 5-40 for a photograph of a sediment trap.

Both sediment ponds and sediment traps require periodic inspection and maintenance. Inspections shall occur following each significant rainfall to ensure proper drainage and to determine if structure repairs are required. Maintenance

shall include removal and disposal of accumulated sediment from the settling basins in order to maintain their operating capacity. Sediment shall be disposed of in area that would preclude the sediment from entering waterbodies downstream.

Figure 5-39: Sediment Trap

Water leaving sediment traps and basins shall be tested for applicable parameters (Schedule A of the *Environmental Control Water and Sewage Regulations, 2003* under the *Water Resources Act)*. Following testing, the addition of chemicals or the use of mechanical processes may be required to treat the water in conjunction with settling and filtration.

Contaminated or silted water pumped from excavations or work areas, or any runoff or effluent shall have sediment removed by applicable sediment control measures as outlined in Section 5.25, before discharging to a watercourse, waterbody or other ecological sensitive area. In addition, any effluent directed out of the Project site shall be tested for TSS and hydrocarbons (if there are any indications of hydrocarbon contamination, such as a sheen or odour) before being discharged to any watercourse, waterbody or other ecological sensitive area. Effluent discharge shall comply with the provincial *Environmental Control Water and Sewage Regulations, 2003* under the provincial *Water Resources Act.*

With respect to maintenance of water quality within receiving waterbodies on and around the site, the *CCME Canadian Water Quality Guidelines for the Protection of Aquatic Life* shall be used.

5.26.2 Design Criteria and Construction Considerations

The design of the structures shall consider the following:

a) The loading of suspended solids in the water;

b) Particle size and gradation;

c) The volume of water to be treated;

d) The rate of inflow;

e) Rate of outflow; and

f) The contributing surface area.

Specific design criteria is provided below:

a) Design storm shall be the precipitation of the 24 hour rainfall intensity from a 1:20 year storm;

b) Drainage area for each sediment retention structure shall not exceed 2 ha;

c) Ponds shall be located in low lying areas where they will not contribute to high groundwater conditions and where the system can return the water to a body of water or recharge the water table;

d) The Contractor may also use other low-lying areas or wetlands for treating lightly silted water or smaller quantities of water;

e) Sedimentation ponds shall be accessible by heavy equipment for removal of accumulated silt;

f) Pond designs shall include an overflow discharge in case of flooding. The overflow section shall have a minimum width of 1.5 m for every 250 m^2 of pond area;

g) Provide 1 to 2 % elevation drop between inlet and outlet grades; and

h) Maintain a minimum pond depth of 1 m. A minimum length to bottom width ratio of 4:1. The size shall be determined to ensure discharge water meets the *Environmental Control Water and Sewage Regulations, 2003.*

5.27 DEWATERING WORK AREAS

Environmental Concerns

The major concerns associated with dewatering are sedimentation, direct fish mortality, and/or habitat destruction for freshwater and marine fish species.

Environmental Protection Procedures

a) Filtration or other suitable measures, such as settling ponds, silt fences and dikes, shall be implemented for sediment removal and turbidity reduction in water pumped from work areas before discharging;

b) Where possible, clean water meeting the *Environmental Control Water and Sewage Regulations, 2003* shall be discharged to vegetated areas to further reduce any potential effects on watercourses. Additionally, mechanisms to prevent scouring and erosion of the discharge location shall be installed as outlined in Section 5.25;

c) The size of sedimentation ponds shall be designed to accommodate the anticipated volume of collected water and meet discharge criteria for water quality as outlined in Section 5.26;

d) Discharged water shall be encouraged to follow natural surface drainage patterns;

e) Harmful alteration, disruption and destruction of fish habitat shall not be permitted unless a formal HADD Authorization has been obtained from DFO; and

f) See Fish Habitat and Relocation in Section 5.19 Alterations to a Body of Water/Instream Works

5.28 BLASTING AND WASTE ROCK DISPOSAL

Environmental Concerns

The general environmental concerns associated with on-land blasting include:

a) Destruction of vegetation outside excavation limits;

b) Noise disturbances to wildlife;

c) Disturbance of archaeological resources;

d) Release of chemicals (i.e. ammonia) to the environment (explosive mixtures and products); and

e) Dust generation.

Blasting in or near water bodies can affect organisms with swim bladders (fish) but may also affect a variety of aquatic animals including shellfish, marine mammals, otters, seabirds and waterfowl. The introduction of sediment into the water column is also a concern for marine/freshwater water quality and related effects on aquatic life.

Environmental Protection Procedures

The handling, transportation, storage and use of explosives and all other hazardous materials shall be conducted in compliance with all applicable laws, regulations, orders of the DOEC and the Service NL, the *Explosives Act*, and the *Transportation of Dangerous Goods Act*. The following measures shall be implemented to minimize the effect of the use of explosives and blasting:

a) Explosives shall be used in a manner that shall minimize damage or defacement of landscape features, trees, ecologically sensitive areas such as wetlands, and other surrounding objects by controlling through standard best practice (including precisely calculated explosive loads and adequate stemming), the scatter of blasted material beyond the limits of activity. Outside of cleared areas, inadvertently damaged trees shall be cut, removed, and salvaged if merchantable (Section 5.8). Fly rock that inadvertently enters a waterbody

watercourse or any ecologically sensitive area, and that can be recovered without further damage to the environment shall be removed. Instances where larger fly rock (boulders) enters theses areas or deep waterbodies, recovery of this shall be discussed with the On-Site Environmental monitor;

b) Blasting patterns and procedures shall be used which minimize shock or instantaneous peak noise levels;

c) Time delay blasting cycles or blasting mats shall be used, if necessary, to control the scatter of blasted material;

d) Blasting shall not occur in the vicinity of fuel storage facilities;

e) All blasters shall have a Blasters' Safety Certificate from the NL Department of Labour. This certificate and a Temporary Magazine License shall be obtained prior to drilling and blasting;

f) Use of explosives shall be restricted to authorized personnel who have been trained in their use;

g) There shall be separate magazines on site for explosives and for dynamite blasting caps. All temporary magazines for explosive storage shall have appropriate approvals;

h) The immediate area of the blast site shall be surveyed within one hour prior to a blast and operations shall be curtailed if wildlife (e.g. black bears, water fowl, raptors, etc.) is observed within 500 m. Environmental personnel and On-Site Environmental Monitors shall conduct pre-blast monitoring to see and identify species of concern. Additionally, any individual animal sightings by other personnel shall be reported to the On-Site Environmental Monitor. Blasting may be delayed in such circumstances until wildlife have been allowed to leave the area of their own accord;

i) All blasting associated debris, such as explosive boxes and used blasting wire, must be collected for proper disposal as soon as possible following blasting activity;

j) If blasting is necessary within the vicinity of an archaeological site, precautions shall be taken to ensure that blasted material and shock waves do not disturb any part of the site. If necessary, protective covering shall be applied to the site under the supervision of an approved archaeologist. Blasting shall not be undertaken in these areas without first notifying the On-Site Environmental Monitor;

k) Waste rock that is suitable for usage at the site shall be set aside for subsequent use. Waste rock not suitable for site use shall be deposited in the designated stockpile area;

l) Previous testing on selected samples of bedrock has shown the samples to be Non-Potentially Acid Generating (NPAG). As a precautionary measure the On-Site Environmental Monitor shall inspect all areas of blasted rock and rock stockpiles to ensure no evidence of PAG material exists; and

m) If possible, blasting shall be done outside of sensitive time periods for important wildlife areas (See Table 5-1).

Blasting in Close Proximity to or In a Body of Water

Seismic geophysical methods may require in-water blasting. This may include the use of small sources of energy (explosives, air gun, weight drop, etc.) in the water column.

The following measures shall be implemented to minimize the effect of the use of explosives and blasting in or near water:

a) When blasting operations are within 200m of a waterbody occupied by fish, the operations shall be carried out in accordance with DFO guidelines;

b) Downstream areas shall be monitored after each blast for evidence of fish kills and if any are evident, blasting operations shall cease and the incident shall be reported to the On-Site Environmental Monitor;

c) Three hours prior to any blasting activities near water bodies, a visual reconnaissance of the area shall be undertaken to establish the presence of water fowl or aquatic mammals;

d) If blasting is necessary within 15 m of a waterbody, it shall be undertaken in compliance with the required Water Resources permits from the DOEC, and DFO Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters, 1998. A copy of this reference shall be kept at the Project site and made available to all contractors;

e) Underwater blasting activities shall require review and authorization from DFO, the On-Site Environmental Monitor shall confirm that the DFO Area Habitat Biologist has been notified 24 hours before the start of blasting operations;

f) Drilling and blasting activities shall be undertaken in a manner that ensures the magnitude of explosions is limited to that which is absolutely necessary. A blasting plan shall be reviewed with the On-Site Environmental Monitor in advance of work in close proximity to water bodies;

g) For multiple charges, time delay detonators shall be used to reduce the overall detonation to a series of single explosions separated by minimum delay;

h) Large charges shall be subdivided into a series of smaller charges with minimum delay detonation;

i) The on land set-back distance from the blast site to the waterbody or the set-back distance around the blast site in the waterbody shall be based on the maximum weight of charge to be detonated at one instant in time, the substrate, and the type of fish or fish habitat in the area of the blast. These set-back distances are outlined in the Guidelines for Use of Explosives In or Near

Canadian Fisheries Waters, 1998 and the DFO Fact Sheet for Blasting – Fish and Fish Habitat Protection; and

j) Blast holes shall be stemmed with sand or gravel to grade or to streambed/water interface to confine the blast.

Waste Rock Disposal

For environmental protection against ARD and other leaching of heavy metals the On-Site Environmental Monitor shall visually inspect rock before, during, and after blasting work and on a periodic basis. Previous surveys have indicated that materials at the site are Not Potentially Acid Generating (NPAG), however in the event that visible evidence of ARD is noted, the On-Site Environmental Monitor shall be notified immediately. Visible evidence of ARD is typically a yellowish color of water or sediment called yellow boy or evidence or sulphides in rock. Photographs of yellow boy and sulphides are shown in Section 5.22 in Figures 5-16 to 5-19).

Stockpiling shall be completed in a manner that will reduce the potential for acid rock drainage and metal leaching. All stockpiles shall be placed in an area where drainage can be collected, tested and treated, if required. Consideration shall be given to installing a settling pond for runoff to deal with suspended solids. Stockpile areas and limits of clearing shall be staked and/or flagged to prevent overextension of the development, thereby minimizing the extent of the operation.

Treatment shall be site-specific based on analytical results, however typical treatment shall include settling ponds, the addition of chemicals or the use of mechanical processes to aid in settling or filtration. Treatment options shall be confirmed by the On-Site Environmental Monitor and approved by DOEC.

The release of water from blasting activities and waste rock drainage shall meet Schedule A of the *Environmental Control Water and Sewage Regulations,2003* before it shall be permitted to be discharged directly or indirectly into a storm sewer, body of water or onto the ground.

5.29 CONCRETE PRODUCTION

Environmental Concerns

The major concern relating to concrete production is the effects of effluent released to the environment. Liquid wastes may contain hazardous materials such as cement, concrete additives, and form oil.

Cement is very alkaline and washwater from spoiled concrete or from the cleaning of the batch plant mixers and mixer trucks, conveyors and pipe delivery systems can have pH levels outside the acceptable range. Similarly, spoiled concrete or washwater would contain concrete additives and agents, some of which are toxic to aquatic species. Aggregates, particularly the finer sand fractions may be washed from spoiled concrete or discharged in washwater. Uncontrolled release of such washwater, chemicals and sediments could adversely affect aquatic life and aquatic habitat.

Environmental Protection Procedures

a) Approval from DOEC shall be obtained to establish the required concrete batch plants at each site. Plant operations shall comply with the conditions outlined in the approvals and requirements under air pollution control regulations;

b) Prior to the release of effluent to the environment it shall be tested for appropriate parameters (as outlined in Schedule A of the *Environmental Control Water and Sewage Regulations, 2003*) to ensure effluent quality standards are met. The specific criteria for concrete production are a pH level between 5.5 and 9 and TSS less than 30 mg/L. Release shall be in accordance with runoff control procedures;

c) With respect to maintenance of water quality in receiving waterbodies on and around the site the *CCME Canadian Water Quality Guidelines for the Protection of Aquatic Life* shall be used;

d) If water to be released does not meet discharge criteria, it shall be further treated until these discharge criteria have been met;

e) Treatment shall be site-specific as it depends on analytical results, however typical treatment may include the addition of chemicals or the use of mechanical processes to aid in filtration or settling. Treatment options shall be confirmed by the On-Site Environmental Monitor and approved by DOEC;

f) The *Environmental Code of Practice for Concrete Batch Plant and Rock Washing Operations, 1992* shall be adhered to during concrete production activities, as applicable;

g) When concrete is to be placed within 15m of a waterbody, provisions of all required permits shall be followed. Under no circumstances shall fresh concrete come into contact with a waterbody, before the concrete has cured;

h) Washwater from the cleaning of mixers, mixer trucks and concrete delivery systems shall be handled using the procedures outlined in Section 3.0 of the *Environmental Code of Practice for Concrete Batch Plant and Rock Washing Operations.* The following outlines important steps to take; however the code of practice shall be reviewed thoroughly:

   i) All rinsing activities shall be carried out at the site of the concrete batch plant, except rinsing of the chute;

   ii) The rinsing of the chute may be carried out at the delivery site but care and caution shall be taken before any concrete is rinsed from a chute at the delivery site. It is permissible to rinse onto the ground or soil but under no circumstances into a pond or stream or onto a surface that leads directly to a water body, such as a storm sewer;

   iii) All rinsing activities at the site of the batch plant shall be done over a containment pond (approximately 12.2 m x 4.57 m and less than 0.91 m deep). The material used to form the bottom and sides of the pond can be compacted clay or a synthetic liner, however the DOEC shall approve

any installation of a synthetic liner. The pond shall be self contained with no water inlets or outlets and no possibility of surface drainage into or out of the pond;

iv) Any trucks returning with unused concrete shall dispose of this concrete into an approved area able to contain it while still in liquid form before the trucks can be washed. Once the concrete has hardened it may be used as fill material. Liquid concrete shall not be permitted to run freely over the ground;

v) Once all concrete has been removed from the truck, the truck may be brought over to the containment pond where washing can take place. Any water that is used to wash the truck shall be directed into the pond;

vi) When the water level in the pond reaches a height that necessitates discharge, water can be discharged following the procedure outlined in b) and c) above otherwise it shall be removed by pumper truck or undergo additional treatment; and

vii) Water shall not be discharged in an area where it would cause erosion or be able to pick up solids from the surface.

5.30 DUST CONTROL

Environmental Concerns

The environmental concerns associated with dust include effects on human health and aquatic ecosystems, waterfowl and vegetation.

Environmental Protection Procedures

The following measures shall be taken to mitigate potential effects of dust:

a) Dust from construction activities shall be controlled where possible by using frequent applications of water. Waste oil shall not be used for dust control but other agents such as wood chips, calcium chloride, matting and re-vegetation shall be considered on a site-specific or as needed basis and shall require the approval of appropriate regulators;

b) Environment Canada's Best Practices for the Use and Storage of Chloride-Based Dust Suppressants, (February, 2007) shall be followed for the application of chloride based dust suppressants. This includes but is not limited to:

   i) Chloride based dust suppressants shall not be applied prior to a heavy rainfall or if rain is threatening for at least 36 hours;

   ii) Dust suppressants shall be applied after a rainfall event to aid in mixing.

   iii) Suppressants shall be applied during early morning or evening times to reduce evaporation; and

   iv) Chloride suppressants shall not be applied to a bridge deck or paved surface.

c) Dust control agents (wood chips, calcium chloride, matting, etc.) shall be stored at suitable distances from all watercourse, water body, or ecologically sensitive areas using proper Buffer Zones (Section 5.18).

5.31 NOISE CONTROL

Environmental Concerns

A variety of noises associated with construction and operation activity can negatively affect wildlife and fish and can affect human safety and health. Noises associated with blasting are temporary in nature and noises associated with drilling are considered long-term, but localized.

Environmental Protection Procedures

Measures shall be implemented wherever possible to minimize potential effects arising from a variety of noise sources, including:

a) Wildlife surveillance shall be conducted prior to and post noisy activities. Activities may be delayed until wildlife have been allowed to leave the area as directed by the On-Site Environmental Monitor;

b) Adherence to all applicable permits and approvals;

c) All equipment shall have exhaust systems regularly inspected and mufflers shall be operating properly in accordance with the manufacturers recommendations; and

d) Low level flying of aircraft shall be avoided in areas where wildlife, particularly sensitive wildlife are present (i.e. caribou, osprey, harlequin duck and other waterfowl).

5.32 RESOURCE SPECIFIC MITIGATIONS

Environmental Concerns

Construction activities have the potential to impact a number of specific resources in the Lower Churchill Region. The resources are historical and archaeological resources, species at risk, forestry resources, land use, etc.

5.32.1 Historic and Archaeological Resources

Sites of historic or archaeological significance have been identified at the Muskrat Falls generation site, the reservoir impoundment area (Component 1) and the HVac transmission line (Component 4b). When working in areas of high potential for historic or archaeological sites, site-specific work measures shall be developed.

To date, fifty-nine (59) sites have been identified in the area of the generation facility, reservoir and the HVac transmission line. Sites are a combination of archaeological sites and sites that are of cultural and spiritual importance to the Innu.

Sixteen (16) sites were recovered through fieldwork during 2012, and the remainder of sites will be either protected during Construction or recovered prior to Construction. See Table 5-4 for information about the known sites within the project boundaries including proposed mitigation measures and contributing project activity.

Table 5-4: Historical and Archaeological Resources in the Lower Churchill Region

Archaeological Registration Number/Name	Project Feature	Environmental Mitigation	Contributing Project Activity
FhCe-01	Muskrat Falls Generation Facility	To be recovered	Several Project Activities
FhCe-02	Muskrat Falls Generation Facility	Protected/To be recovered	Construction of Generation Components
FhCe-03	Muskrat Falls Reservoir/ Generation Facility	Protected/To be recovered	Several Project Activities
FhCe-04	Muskrat Falls Reservoir/ Generation Facility	Recovered	Several Project Activities
FhCe-05	Muskrat Falls Reservoir/ Generation Facility	Recovered	Several Project Activities
FhCe-06	Muskrat Falls Reservoir/ Generation Facility	To be recovered	Several Project Activities
FhCe-07	Muskrat Falls Reservoir/ Generation Facility	Recovered	Several Project Activities
FhCe-08	Muskrat Falls Reservoir	To be recovered	Reservoir Preparation; Impounding

Archaeological Registration Number/Name	Project Feature	Environmental Mitigation	Contributing Project Activity

Ushkan-shipiss	Muskrat Falls Reservoir	To be recovered	Reservoir Preparation; Impounding

As per the requirements of the PAO, a historic and archaeological resources impact assessment shall be conducted at sites where historic and archaeological resources may be unearthed. For low potential sites a desktop review may be adequate. For higher potential sites, field assessment may be required.

Existing information shall be provided where available, and where activity will take place in an area that has not been previously reviewed a historic resources overview assessment may be required.

The following mitigations shall be implemented with respect to historic and archaeological resources:

a) All persons on site shall be informed of the historic resources potential of the area, of their responsibility to report any unusual findings, and to leave such findings undisturbed;

b) A site orientation to be attended by all staff and contractors this shall identify areas of high historic resources potential;

c) The On-Site Environmental Monitor shall report to the PAO if any potential archaeological resources are uncovered during excavation (Martha Drake, Provincial Archaeologist, 709-729-2462);

d) Where possible known sites shall be avoided by modifying design (i.e. road and transmission line alignment adjustment) to ensure a 50 m minimum buffer (actual size may be revised based on direction from the PAO). Where the site cannot be avoided, the site shall be recorded/recovered to the satisfaction of the PAO before work can proceed as per Historic Resources Management Plan developed by NE-LCP;

e) The onsite environmental monitor shall be immediately contacted if any historical resources are discovered during the course of the work. All work within 50 m of the discovery location shall stop and contingency plan procedures implemented; and

f) Regular monitoring shall be conducted by the On-Site Environmental Monitor to ensure that site protection measures are adequate and that the terms and intent of the P-WEPP requirements are being met. Sites registered with the PAO outside the immediate Project area shall be visited annually by the On-Site

Environmental Monitor during periods when the sites are not snow covered to ensure they have been left undisturbed.

5.32.2 Species at Risk

Many wildlife species (including plants, animals and birds) and their habitat are protected under provincial and federal regulations such as the *National Species at Risk Act*, *Migratory Birds Convention Act* and the *NL Endangered Species Act*. Of primary concern are disturbances, destruction or degradation of critical habitat, recovery habitat and disturbance during critical life periods (i.e. nesting and spawning) Displacement of species due to construction activities (i.e. blasting) or encounters with construction equipment and personnel is also a concern.

Six species have been identified through the Environmental Assessment process as being of concern in the Lower Churchill River Area and the HVac transmission line right-of-way. They are as follows:

a) Common Nighthawk;

b) Olive Sided Flycatcher;

c) Woodland Caribou;

d) Grey Cheeked Thrush;

e) Rusty Blackbird; and

f) Harlequin Duck;

Reference should be made to the fact sheets for species listed on the SARA list and the Endangered Species Act to find further information about these species.

A research permit for work around SARA listed species may be required from the Wildlife Division, Dept. of Env. and Conservation, Gov NL.

The following mitigations shall be implemented with respect to endangered, threatened or vulnerable wildlife at the site:

a) Critical habitats shall be identified on site plans or plan profiles for roads and transmission lines for C-SEPP*;*

b) All site personnel shall receive training to recognize any endangered, threatened or vulnerable species of plant or animal and its habitat prior to the start of clearing and any other site activities;

c) Through site surveys, existing potential rare plants habitat shall be identified and mapped prior to the commencement of any site work. Based on this mapping, travel routes and “no-go” zones shall be established to avoid sensitive areas. Animals and animal habitats such as active nesting sites and beaver dams, shall also be identified and mapped;

d) Work plans shall be submitted in advance and shall be reviewed for potential conflicts, including rare plants, endangered species, critical habitat and other areas of concern (i.e. beaver dams and nesting sites);

e) Where required (i.e. as per the Avifauna Management Plan or associated EEM Plans), prior to commencement of work, an on-site wildlife biologist shall be on-site to survey for areas of concern (critical breeding habitat, rare plants, nest sites, etc.) and to provide input on work methods, lay out approved travel routes and work areas and associated buffer zones;

f) In areas where concerns have been identified, the On-Site Environmental Monitor shall ensure work crews are aware of concerns identified and work methods to be used;

g) There shall be no intrusion into “no-go” zones without prior permission of the On-Site Environmental Monitor;

h) Crews shall not travel outside of marked work areas and trails. If markers are not clear or are missing, the On-Site Environmental Monitor shall be consulted prior to commencing or continuing with the work;

i) The On-Site Environmental Monitor shall monitor work activity in sensitive sites at all times and provide advice on access and travel requirements;

j) The Environmental Coordinator shall be informed of activities near sensitive areas so that they may notify any regulators;

k) Notice of potential impacts to rare or protected species and their habitat at the job site shall be given to the On-Site Environmental Monitor for evaluation;

l) Prior to construction during nesting season (May 15 to August 15) the area shall be surveyed for active nests including raptor and other SARA listed species listed in Section 5.30.2;

m) No clearing shall take place within 800 m of an active raptor nest between the months of May 15 to August 15. If a nest is encountered during clearing activities, all work shall stop until the site is cleared by the On-Site Environmental Monitor, in consultation with the appropriate regulatory agencies.

n) For all work activities other than clearing, a 200 m buffer shall be respected for active raptor nests from May 15 to August 15. Within this 200 m buffer zone the following applies, after consultation with the provincial government:

o) Only essential vehicular activity shall be permitted;

p) Work shall only be permitted in the presence of the On-Site Environmental Monitor;

q) Crews shall cease work if there is a disturbance at a nest until activity at the nest has returned to normal; work shall not commence again until approval from the On-Site Environmental Monitor.

r) Crews shall not establish a permanent or temporary camp within 800 m of a known raptor nest;

s) If a tree containing an inactive nest is encountered during reservoir and site clearing, the nest shall be assessed for viability and if the nest is deemed viable a platform shall be established as approved by the provincial government; and

t) If a tree containing an inactive nest is encountered during the transmission line right-of-way clearing a platform may not be required as the transmission line tower will provide an alternative nesting site.

5.32.3 Wildlife Protection

The following mitigative measure shall be implemented for the protection of wildlife at the site:

a) Construction activities shall be scheduled considering any sensitive areas of fish and wildlife habitat and critical periods in fish and wildlife cycles, and considering additional mitigation measures that may be required. Annual timing of migration, spawning and calving in the vicinity of the site shall be considered at all times;

b) Personal pets shall not be brought to the construction site;

c) Buffer zones shall be implemented to protect wildlife at the site, see Section 5.7 for the buffer zones for helicopter traffic at the site;

d) Fishing and hunting are prohibited at or near the construction site. All project participants shall be prohibited from fishing and hunting at or near the construction site while working on the project;

e) Under no circumstances are wildlife to be fed and all measures shall be taken to avoid inadvertent feeding;

f) Wildlife shall not be chased, caught, diverted, followed or otherwise harassed by project participants;

g) All Wildlife sightings and nuisance wildlife shall be reported to the On-Site Environmental Monitor;

h) The forestry branch shall be contacted and updated with regards to nuisance wildlife and wildlife encounters;

i) Equipment and vehicles shall yield the right-of-way to wildlife and adhere to construction site speed limits;

j) Environmental awareness training, with regular briefings, shall be implemented for all personnel;

k) All persons on site shall be made aware of the potential for encounters with black bears and instructed to report all sightings to the On-Site Environmental Monitor;

l) Black bear deterrent measures such as bear bangers and bear spray may be used, and translocation of bears shall be undertaken before any lethal means are considered. A research permit for relocation of bears may be required from the Wildlife Division, Department of Environment and Conservation, Government of Newfoundland and Labrador;

m) Fire arms shall not be permitted on site, with exception of approved bear monitors;

n) Black bear protection permits shall be obtained for each black bear monitor. Permits shall be signed by the individual that the permit is issued to;

o) An Avifauna Management Plan has been developed by NE-LCP. This Plan includes:

    i) Surveying for migratory bird nests prior to cutting during the nesting season;

    ii) Surveying for sensitive habitat that typically supports nest;

    iii) Information regarding avoiding identified nests until fledged;

    iv) Information regarding cutting in sensitive habitats during nesting season; and

    v) Employing on-site support of qualified biologists during construction, as required.

p) Clearing activities between May 1 and July 31 shall be in compliance with the Avifauna Management Plan; and

q) No one shall disturb, move or destroy migratory bird nests. If a nest or young birds are encountered, work shall cease in the immediate area of the nest. Work shall not continue in the area until the nest is no longer occupied, otherwise the work plan shall be modified to avoid nest sites by a minimum of 30 m (100m for the Rusty Blackbird).

Caribou

During the calving (May 28 – July 1) and post calving seasons (July 2 – September 20) if caribou approach the Project, it is proposed there be a progressive level of heightened awareness by Project personnel AND increased interaction with the Wildlife Division. Project personnel shall follow the following mitigation and monitoring measures (as outlined in the Caribou Management Plan):

a) The Wildlife Division of the NLDEC shall notify the Project Manager should data from satellite collars indicate that caribou are within 20 km of the Project site;

b) Upon notification of caribou within 20 km of the Project site, surveys will be instituted within this radius. The most appropriate form of surveying will be evaluated during the first two years of construction. Initially a preference will be given to observations from fixed points along the high ground adjacent to Project activities. As an adaptive management measure, if ground-based surveys prove not to be useful or feasible, aerial surveys will be implemented at the Muskrat Falls Generating Facility construction site;

c) Sightings or reports of caribou, within 20 km of Project infrastructure and activities will be described in a one-page update of wildlife observations associated with the Environmental Protection Plan (EPP). This update will normally be sent by Nalcor Energy to the Wildlife Division in Goose Bay and Corner Brook on a bi-weekly basis (whenever Project activities are ongoing). Such updates will also be presented during environmental awareness training and regular briefings for all personnel;

d) When caribou are known to occur within 20 km, a 5 km buffer around each area of activity will be monitored on a weekly basis by scanning for tracks or animals from road-accessible vantage points within this radius. Observations reported by personnel or others will also be recorded and investigated within this area. Reporting to the Wildlife Division would be increased to a weekly basis in this scenario. Note that if caribou are not seen within the 20 km radius, the 5 km buffer would be monitored on a bi-weekly basis (from road-accessible vantage points) over the course of the calving and post-calving period. If caribou are observed at a distance of less than 5 km from Project infrastructure and activities, Nalcor Energy will issue an advisory of their proximity to personnel to be alert, The monitoring from road accessible vantage points will increase in frequency to a daily basis by the on-site environmental monitor;

e) While caribou are within 5 km of Project infrastructure and activities, all sightings of caribou will be reported to the on-site Environment Monitor, and will be immediately communicated to all vehicle operators. Caribou will not be blocked from crossing access roads or work areas. If caribou are crossing or attempting to cross the site roads, then traffic will stop and wait for them to cross;

f) Prior to primary blasting at the main site a wildlife survey will be conducted. If caribou are within 3 km of the site the blasting will be delayed until the caribou have left the area. Methods to encourage the caribou to leave the area will be utilized as agreed to and in consultation with the Wildlife Division. The 3km radius may be reduced based sound monitoring surveys, as agreed to by the Wildlife Division;

g) For all other activities (vegetation clearing, grubbing, grading and leveling, laydown and storage of equipment and material in existing areas, generators to support the activity, vehicle and heavy equipment use, handling and transfer of fuel and other hazardous material, waste disposal, sewage disposal and hazardous waste disposal) which would not be audible beyond a short distance, if caribou approach to within site of the work area (up to maximum buffer of 500

m), the On-Site Environmental Monitor will determine if activities will need to be delayed or curtailed to allow the animals to proceed onwards beyond the work site. Such interactions will be included in the weekly reports to the Wildlife Department; and

h) For activities related to transmission line construction (localized and low intensity blasting, tower erection and conductor stringing) which would not be audible beyond a short distance, if caribou approach to within site of the work area (up to maximum buffer of 500 m), the On-Site Environmental Monitor will determine if activities will need to be delayed or curtailed to allow the animals to proceed onwards beyond the work site. Such interactions will be included in the weekly reports to the Wildlife Department;

Throughout the construction of the Project, Nalcor Energy will maintain communications with the provincial Wildlife Division, and other stakeholders and officials regarding the movements of the George River Herd and/or possible woodland caribou (e.g., Red Wine Mountains Caribou Herd) sightings in the Project area.

5.32.4 Muskrat Falls Rock Knoll

Construction activities conducted to reduce interaction with rock knoll to extent practical, in consultation with the Innu Nation through the EMC.

5.33 COMMISSIONING

Environmental Concerns

Commissioning will occur after installation and prior to release for commercial operation; it is a means of verifying and documenting that each component, system and assembly of a facility is built, installed and tested as planned and designed to meet Project requirements.

It will take about three months to commission each turbine at the generation facility. This includes physical inspections, comparing as-built components to the original design drawings and specifications, testing in a de-energized state and energized state, in isolation, and connected to the transmission line grid, for various operating conditions. Commissioning the proposed transmission line is related to mechanical acceptance so that all hardware is in place and properly installed.

Environmental concerns related to commissioning relate to unintended release of hydrocarbons into the environment.

Environmental Protection Procedures

a) All equipment containing fluids shall be checked for leaks by the supplier and/or manufacturer and shall be tested according to the manufacturer's directions prior to commissioning activities;

b) There shall be monitoring during commissioning for spills and/or leaks;

c) Appropriate spill kits shall be on hand to respond to a spill or leak (see Section 5.13);

d) In the event that a spill or leak is detected, the Master Spill Response Plan shall be referred to for response to any incidents; and

e) All other requirements of this P-WEPP shall be adhered to during commissioning.

5.34 DIVERSION HEAD POND FORMATION AND RESERVOIR IMPOUNDMENT

Construction of the north and south dams will result in the formation of a 59 km long reservoir. At Full Supply Level (FSL), the area of inundation will be 41 km², resulting in a reservoir with a total surface area of 101 km². During the impoundment of the reservoir the downstream flow will be significantly reduced (30% of normal flows will be maintained during impoundment. It is estimated that it will take approximately 10 to 12 days to fill the reservoir to FSL, at which time normal downstream flows will re-commence in the river. A detailed plan outlining the schedule and duration of diversion head pond formation and impoundment will be provided to DFO in advance of these activities, for their review and acceptance/approval.

Prior to full impoundment, a diversion head pond will be created when the riverside cofferdam is complete and the river is diverted through one spillway during construction of the hydroelectric facilities. Prior to winter freeze up the flow through the spillway will be controlled and a diversion head pond will be formed to facilitate the development of a stable ice cover for the remainder of the construction period. The diversion head pond will be maintained at an elevation of 24 m during the spring, summer and fall seasons with a total reservoir surface area of 74 km². In winter, the head pond will be maintained at an elevation of 25 m with a total reservoir surface area of 76 km². During diversion, the total outflows will be equal to the total inflows.

Environmental Concerns

Environmental concerns associated with formation of the diversion head pond and reservoir impoundment include:

a) Previously dry soils will become hydrated. This may change the cohesive properties of the soil and may lead to slumping; and

b) Nesting/mating of terrestrial wildlife in the impoundment/head pond zone may be flooded and spawning and habitat of aquatic species in the impoundment/head pond zone and downstream may be affected.

Environmental Protection Procedures

The flooding of habitat for terrestrial and aquatic species is date sensitive due to the timing of reproduction and rearing in a variety of species. See Table 5-1 in Section 5.1 for information related to sensitive life stages for aquatic and terrestrial fauna in Labrador. As construction progresses and more certainty is gained regarding the timing of head pond formation/impoundment, a filling plan shall be developed in consultation with the Nalcor Environmental Assessment Coordinator and relevant regulatory authorities.

The filling plan shall include timing of activities, sequencing and execution plans and relevant mitigations depending on the timing/season of impoundment/head pond formation.

5.35 SITE REHABILITATION

Environmental Concerns

The primary concern with environmental rehabilitation is site stabilization and erosion prevention. This is particularly pertinent in regards to temporary structures such as roads, quarries, cofferdams, etc.

Environmental Protection Procedures

Environmental rehabilitation shall be consistent with all applicable standards, codes, acts and regulations and the conditions of EA release.

General rehabilitation approaches are provided in this section however specific rehabilitation approaches shall also be developed in compliance with regulatory requirements and industry best practice and shall be completed on a site by site basis and included in the C-SEPP. An outline of the requirements of the site-specific rehabilitation plan is provided below.

5.35.1 Site-Specific Rehabilitation Plan

The following outlines the requirements of the Site-Specific Rehabilitation Plan:

a) Removing and stockpiling overburden and organic material for re-use;

b) Re-grading areas to control erosion and establish suitable drainage;

c) Replacing the overburden and organic material to produce conditions for re-growth; and

d) Encouraging natural re-vegetation, or re-planting with suitable vegetation.

On some sites there may be limited overburden and organic matter. Nutrient poor soils and a shorter growing season may also slow down and reduce the rate of vegetation re-establishment. In these cases it may be necessary to import seed, mulch or geotextiles to artificially improve revegetation for key areas. Measures to prevent the invasion of disturbed sites by non-native plant species shall be considered. Acceptable approaches include, but are not limited to:

a) Use of native plant and soil material for rehabilitation and re-vegetation;

b) Use of only species that are non-aggressive and non-persistent (where local plants are not available or shall not meet the rehabilitation objectives).

c) Implementation of measures to ensure that additional materials (required to limit erosion, reduce sedimentation or enhance establishment) are weed and disease free; and

d) Equipment coming from other regions or provinces shall be clean and free of potential seed sources of invasive plants.

All areas of the construction sites shall require careful consideration of the landscape within which the work is taking place, to ensure that the correct approach is taken. Areas shall be prioritized in terms of need and importance and the level of rehabilitation shall be modified accordingly. Factors that shall be considered in determining the rehabilitation approach include, but are not limited to:

a) Site and public safety (including future access requirements);

b) Sedimentation concerns and proximity to water bodies;

c) The natural habitat of the area (i.e. vegetation, soil, hydrology, etc.);

d) Wildlife habitat considerations;

e) Riparian habitat considerations;

f) The productivity of the site (i.e. moisture, content and nutrient regime) and its effect on re-vegetation;

g) The availability of materials and implications of importing unnatural material;

h) Land use and their effect on success of rehabilitation techniques; and

i) Overall cost of rehabilitation measures.

Once the schedule of work at each construction area has been developed, a detailed schedule for carrying out rehabilitation work shall be developed in accordance with

regulatory requirements and shall also consider industry best practice for implementation of site rehabilitation. The site-specific rehabilitation plan shall indicate timing of the rehabilitation works for each area to be rehabilitated. Consideration shall be given to progressive rehabilitation throughout the construction period, as opposed to waiting for the end of construction before starting with rehabilitation.

5.35.2 General Measures

a) Rehabilitation shall be required for all temporary works including roads, stream crossings, camps and quarry and borrow areas;

b) No temporary buildings or structures associated with the work shall be left on site upon completion of the work;

c) All solid waste, including petroleum, oil and lubricant containers shall be removed from site;

d) Pre/Post occupation inspection shall be completed; and

e) The On-Site Environmental Monitor shall prepare a report for all sites documenting site conditions prior to disturbance and upon site abandonment and rehabilitation. Each report shall include a description of the condition of vegetation and other aspects of natural environment.

Quarry/Borrow Areas

The following measures are specific to quarry and borrow areas and shall be considered in rehabilitation plans for those areas:

a) Any organic material or overburden removed during development of the borrow pits and quarries shall be stockpiled near the pit or quarry area for future use during rehabilitation of the borrow pit or quarry. Overburden (and non-PAG rock) that is not suitable for rehabilitation purposes shall be stockpiled for temporary use or permanent disposal. Stockpiling shall be in stable configurations and contoured to match the surrounding landscape. For temporary stockpiling it shall

be and returned to the borrow pit or quarry opening once extraction from the pit or quarry is complete;

b) As site conditions dictate, vegetation or other cover materials may be established on slopes to control erosion and dust (as outlined in Section 5.25, Erosion Prevention and Sediment Control). Quarries and pits reclaimed during operations may be used as test plots to evaluate suitable re-vegetation techniques to be used for the rehabilitation of other work areas in the future;

c) Arrangements shall be made with the representatives of the Department of Natural Resources for an inspection to be conducted prior to abandonment of the site;

d) All equipment and material shall be removed from the site;

e) All pit and quarry slopes shall be graded to slopes less than 20%, or to a slope conforming to that existing prior to quarrying;

f) Excess overburden may be used for sloping but topsoil or organic material may not be used for sloping. Following sloping, topsoil or organic material may be spread over the entire quarry area to promote vegetation; and

g) Quarry conditions, including slope on rock walls, shall be determined through the Rehabilitation Plan. Each quarry shall be evaluated on a site-specific basis to determine if cliff faces should be converted to rubble slopes.

Roads/Stream Crossings

The following measures are specific to road and culvert/bridge rehabilitation and shall be considered in rehabilitation plans for those areas:

a) The contractor shall submit a plan for controlling erosion during rehabilitation activities. This plan would address construction activities that have the potential for stream sedimentation;

b) When working in a stream or water body, remove all fill around pipes before water bypass installation and pipe removal;

c) The stream shall be dewatered at the site using a non-eroding, water tight diversion during excavation. Settling basins shall be used to ensure that muddy water does not enter the water body;

d) Fill material that requires temporary placement shall be placed in stable areas outside of stream channels and flood plains;

e) Channel banks shall be armoured with large rock, woody debris and vegetation when needed;

f) Channel and vegetation rehabilitation shall be required if there are disturbances upstream and downstream of the stream crossing site;

g) Stream channels shall be restored to natural grade and dimensions and re-vegetation may be required;

h) Culverts within the flood zone (below LSL) may be left in place and flooded during reservoir impoundment/head pond formation. Culverts above the LSL shall be removed;

i) Temporary bridges in all areas of the site shall be removed; and

j) Removed culverts and other structural materials shall be disposed of as per the WMP.

6 ENVIRONMENTAL MONITORING AND FOLLOW UP

6.1 ENVIRONMENTAL COMPLIANCE MONITORING

To ensure that appropriate and effective environmental mitigation measures are employed during construction, the project shall have full-time On-Site Environmental Monitors at various construction sites. These individuals shall inspect worksites and activities for conformance with the P-WEPP, C-SEPPs, engineered mitigation measures required by design; and compliance with government regulations and permits.

This P-WEPP establishes the basis for environmental compliance monitoring at the Project site, i.e. monitoring for regulatory compliance to verify that conditions of all permits and approvals are satisfied, and that all environmental regulatory requirements are met. Refer to the Regulatory Compliance Plan (RCP) for further information on regulatory compliance for the Lower Churchill Project.

Non-conformance with this P-WEPP and/or non-compliance with permits, approvals, and regulatory requirements shall be documented, as indicated in the following paragraphs and in the RCP, and addressed with the contractor responsible for mitigation measures. Corrective action shall be identified, target dates shall be agreed upon, and responsibilities shall be assigned to appropriate personnel. This documentation shall be distributed to other members of the Project's environmental management team and written notice of agreed corrective action shall be forwarded to the contractor so that issues are resolved to the satisfaction of the Project's environmental management team.

If non-conformance items are noted that require immediate attention, or if agreed corrective action is not implemented in a timely and effective manner, then appropriate resources shall be contracted by the project to immediately undertake the required action.

Daily field reports shall be prepared by the On-Site Environmental Monitor/Coordinator and distributed to the Construction Manager, the Environmental Manager, the Environmental Coordinators, NE-LCP, and the Contractor. These reports shall describe the work being undertaken by the Contractor, and document incidents of non-conformance with environmental requirements. An example of the Daily Field Report checklist is located in Section 8.

The Environmental Coordinators, in consultation with project staff and the Contractor, shall prepare quarterly Environmental Compliance Audit Reports (i.e. 1 audit report/quarter for the Hydro component, and 1 audit report/quarter for the Transmission Line components). The reports shall document all incidents of non-compliance and their causes. The Environmental Coordinators shall distribute the Environmental Compliance Audit Reports to relevant Project participants. The Environmental Coordinators shall be responsible for managing the Non-Conformance Registry, including updating it regularly, and incorporating all conditions into the Registry to ensure that these are complied with in a timely manner.

The contractor shall be responsible for developing a site-specific Compliance Monitoring Plan to be included in the C-SEPP. This shall include such things as frequency of monitoring, parameters, locations and media to be monitored, etc.

All analysis conducted to support compliance monitoring shall be subject to the Accredited Laboratory Policy.

6.2 ENVIRONMENTAL EFFECTS MONITORING

The intent of Environmental Effects Monitoring (EEM) is to confirm predictions made as part of the environmental assessment.

EEM monitoring shall be carried out by NE-LCP. The EEM program results shall be communicated to SLI's Environmental Manager by Nalcor's Environmental and Regulatory Compliance Lead.

Should effects deviate from predicted, NE-LCP shall determine the cause and appropriate action. Should this information be linked to work practices, the P-WEPP shall be revised and updates shall be provided to contractors and staff.

It is noted that there may be additional requirements for approvals and communication with the regulators related to the EEM Plan.

6.3 ANNUAL ENVIRONMENTAL PERFORMANCE REVIEW

At the end of each construction year the project shall convene an environmental performance workshop to review all work activities that relate to environmental concerns, issues and/or mitigations. This workshop will include a review of environmental audits carried out by project staff during the year. The review process shall give all parties a chance to evaluate overall environmental performance and compliance with government regulations, permits, this P-WEPP, and C-SEPPs.

7 CONTINGENCY PLANS

Contingency plans to address unplanned occurrences and emergency situations are provided in the following sections. The following unplanned occurrences and emergencies have been addressed under contingency plans:

- Fuel and Hazardous Material Spills (Master Spill Response Plan)
- Wildlife Encounters (including nesting and denning sites)
- Historic and Archaeological Resources
- Forest Fires (ERP)

7.1 FUEL AND HAZARDOUS MATERIALS SPILLS

Spills of fuel and/or hazardous materials can potentially be harmful to human health and safety, vegetation, soil, surface water, ground water, wildlife, aquatic organisms, historic resources and human health and safety.

In case of a fuel or hazardous material spill project staff shall refer to the Master Spill Response Plan for detailed contingency measures. A site-specific fuel and hazardous materials response plan shall form part of the C-SEPP.

To mitigate environmental effects of fuel and hazardous material spills and leaks, Contractors shall at all times maintain in good condition at least one spill kit dedicated to each piece of fuel-powered equipment. Each spill kit shall be located on the equipment and stored in a weather-proof container. Each spill kit shall have an absorption capacity of no less than 23 litres. In addition to equipment-dedicated spill kits, the Contractor shall at all times maintain in good condition spill response caches that are accessible within 15 minutes travel of all work faces and in the immediate vicinity of fuel/hazardous materials storage areas. Each cache shall have sufficient absorption capacity for one thousand (1000) litres of fuel or hazardous liquids (see Section 5.13 for more details on spill kits).

7.2 WILDLIFE ENCOUNTER

Wildlife encounters pose a potential risk for stress or injury to both the wildlife and site personnel. To reduce the risk and stress, control measures and environmental protection procedures have been put in place and are shown below. As a protection measure, hunting, trapping or fishing by Project personnel is not permitted on site.

The following procedures shall be implemented on site to prevent the attraction of wildlife to the Site:

a) Site and working areas shall be kept clean of food scraps and garbage;

b) Animal proof disposal containers shall be used and will be regularly emptied and transferred to an approved waste disposal site (as per WMP); and

c) No personal pets, domestic or wild, shall be allowed on the site.

In the case of wildlife encounters the following shall be implemented:

a) No attempt shall be made by any worker at the project site to chase, catch, divert, follow or otherwise harass wildlife by vehicle or on foot;

b) Equipment and vehicles shall yield the right-of-way to wildlife;

c) Any wildlife sightings or encounters shall be reported to the On-Site Environmental Monitor;

d) The On-Site Environmental Monitor shall be responsible for all actions in response to nuisance animals, including the use of firearms by bear monitors in the project area. A research permit for relocation of nuisance animals may be required from the Wildlife Division, Department of Environment and Conservation, Government of Newfoundland and Labrador;

e) If the nest of any bird is encountered during construction and operation activities, work around the nest shall be stalled until the Wildlife Division has assessed the situation and appropriate mitigation is applied;

f) Any incidents that result in the displacement or killing of wildlife shall be reported to the On-Site Environmental Monitor complete with details on the incident and the names (and contact information) of the persons involved; and

g) In the event of a bear encounter project personnel shall follow the procedures as outlined in the Bear Awareness Training.

7.3 HISTORIC AND ARCHAEOLOGICAL RESOURCES

Historic resource material that is disturbed, destroyed or improperly removed from a site represents a potential cultural loss of information and history that could otherwise be handled and interpreted in an efficient and appropriate manner.

In case of a suspected discovery of an archaeological site or artefact the following procedures shall apply:

a) Archaeological materials encountered shall be reported initially to the On-Site Environmental Monitor. The On-Site Environmental Monitor shall then immediately report this to the On-Site Environmental Coordinator, SLI's Environmental Coordinator (Hydro or Transmission), and Construction Manager. The latter shall report to Nalcor's Site Manager. The Provincial Archaeologist at PAO (Martha Drake, Provincial Archaeologist, 709-729-2462) shall be informed of the discovery by Nalcor's Environmental and Regulatory Compliance Coordinator with the following information:

   i) Nature of activity;

   ii) Nature of the material discovered; and

   iii) Precise location of the find.

b) Under the Historic Resources Act, RSNL 1990, c.H-4, all archaeological sites and artefacts are the property of the Crown, and shall not be disturbed. The project shall take all reasonable precautions to prevent employees or other persons from removing or damaging any such objects or sites. Persons in

contravention and may be held liable for prosecution under Section 35.1 and 35.2 of the *Historic Resources Act* (*RSNL 1990, c. H-4*) for all contravention. Personnel working in the vicinity shall be advised of the find, including the On-Site Environmental Monitor. The site area shall be flagged for protection and avoidance;

c) All work shall cease within 50 m of the discovery until NE-LCP advises the PAO of the discovery. The PAO, in consultation with NE-LCP shall provide direction regarding the discovery and may authorize a resumption of the work. If required, a full archaeological assessment shall be conducted of the site and immediate area; and

d) The PAO shall assess the significance of the discovery and determine if mitigation is required. NE-LCP in consultation with the PAO shall develop mitigation measures and advise the PAO of any such measures.

7.4 FOREST FIRES

Construction for the development of the Lower Churchill may have activities that increase the risk of fire in the natural environment. Fires on site could spread to the surrounding area and forest. The main concerns include human health, damage to vegetation, wildlife and air and water quality. In case of a forest fire project personnel shall refer to the Emergency Response Plan for detailed contingency measures.

The operator shall take all precautions necessary to prevent fire hazards when working at the site. These include but are not limited to:

a) An Operating Permit shall be required during the forest fire season;

b) All flammable materials shall be stored and handled properly; and

c) All flammable waste shall be appropriately disposed of on a regular basis;

In the case of a fire being encountered the following shall be implemented:

a) The Site Manager shall appoint a supervisory staff member as "On Scene Commander" for fighting any forest fires;

b) Immediate steps shall be taken by the operator and contractors on site to contain or extinguish the fire. Applicable personnel shall be trained in fire fighting and the use of such equipment. Equipment shall be provided in proper operating condition to suit the labour force and shall comply with manufacturer's standards;

c) Fires shall be immediately reported to the Site Manager who will in turn report it to the applicable authorities (1-866-709-3473). The following information is required when reporting a fire: name and telephone number, time of detection of fire, size of fire, location of fire, weather conditions (rain, sun, wind direction and speed, etc.);

d) Sufficient firefighting equipment to suit the labour force and fire hazards shall be provided by the contractor. Equipment shall be provided as specified in the forest fire regulations and Operating Permit and shall include shovels, back tanks and axes. Such equipment shall comply with and be maintained to the manufacturer's standards. Project personnel shall be trained in the use of such equipment;

e) During the fire season, ATV's shall be equipped with a fire extinguisher or suitable equivalent containing a minimum of 227 grams of ABC dry chemical. Other machinery and equipment shall be equipped with a fire extinguisher containing a minimum of 4.5 kilograms of ABC dry chemical;

f) The forest fire suppression equipment referred to in the Operating Permit shall be provided at the operating site in the following ratio:

Table 7-1: Forest Fire Suppression Equipment Requirements

Employees	Back Tank Pumps	Axes or Pulaski Tools	Grubbers or Shovels
5 or less	1	1	1
6-10	2	2	2
11-15	3	3	3
16-20	4	4	4
>20	Add 1 back tank pump, 1 axe or Pulaski tool and 2 grubbers or shovels to the above figure for each group of 5 additional employees or fraction of that number of employees. The back tank pump must have a capacity of 20 litres and be of a type approved by the forest service.		

g) The contractor is required to ensure all fire pumps are approved by forest services, and all approvals shall be documented;

h) When the number of employees reaches 20 or over, one fully functional forest fire pump, such as the Wajax Mk3, shall be available at the site. Pump accessories shall include: a gated “Y” valve, hose strangler and two nozzles for each unit, additionally, 610 meters of forest fire hose shall be available for each unit. If there are greater than 40 employees, two of these systems are required;

i) The forestry official issuing the operating permit may specify deviations from the equipment requirements should local operating conditions warrant deviations;

j) The actual location of the forest fire suppression equipment in relation to the operating site may be designated by the forestry official issuing the permit;

k) A copy of the operating permit shall be on the operating site and shall be shown when requested by a forestry official;

l) The operating permit may be temporarily suspended by a forestry official if the fire weather index for that locality rises to high or extreme;

m) Where a forest fire occurs on forest land in an area where logging or industrial operations are being carried out the person/s carrying out the operations shall immediately notify the nearest forest management district office or ranger station and commence fighting the fire with all labour, materials, equipment and facilities

at his or her disposal until relieved of this responsibility by a forestry official or the fire is extinguished; and

n) For additional information regarding forest fire contingency planning, refer to the ERP.

9 REFERENCE DOCUMENTS

Information and documents referenced in this P-WEPP can be found at the NE-LCP Project Office in St. John's and are all publically available documents. DFO Operational Statements and Factsheets as well as DOEC Environmental Guidelines and Federal Government Regulations are included in a reference material document (document # GV-0003-01). A listing of the key reference material is provided below:

Provincial Government Guidelines (Water Resources Division, DOEC):

- *Environmental Guidelines for Watercourse Crossings;*
- *Environmental Guidelines for Stream Crossings by All-Terrain Vehicles;*
- *Environmental Guidelines for Bridges;*
- *Environmental Guidelines for Culverts;*
- *Environmental Guidelines for Fording;*
- *Environmental Guidelines for Diversions, New Channels, Major Alterations;*
- *Environmental Guidelines for Pipe Crossings; and*
- *Environmental Guidelines for General Construction Practices.*

DFO Operational Statements:

- *Aquatic Vegetation Removal in Freshwater Systems Operational Statement;*
- *Beaver Dam Removal Operational Statement;*
- *Bridge Maintenance Operational Statement;*
- *Clear Span Bridges Operational Statement;*
- *Culvert Maintenance Operational Statement;*
- *Dock and Boathouse Construction Operational Statement;*
- *High Pressure Directional Drilling Statement;*
- *Ice Bridges and Snow fills Operational Statement;*
- *Isolated Pond Construction Operational Statement;*

- *Maintenance of Riparian Vegetation in Existing Right-of-ways Operational Statement;*
- *Overhead Line Construction Operational Statement;*
- *Punch and Bore Crossings Operational Statement;*
- *Routine Maintenance Dredging Operational Statement; and*
- *Underwater Cables Operational Statement.*

DFO Fact Sheets:

- Fact Sheet on Effects of Silt on Fish and Fish Habitat;
- Fact Sheet on Blasting – Fish and Fish Habitat Protection;
- Fact Sheet on Ditching;
- Fact Sheet on Temporary Fording Sites;
- Fact Sheet on Forwarder Trails;
- Fact Sheet on Filter Fabric;
- Fact Sheet on Rock Check Dam;
- Fact Sheet on Temporary Bridges;
- Fact Sheet on Resource Road Construction;
- Fact Sheet on Instream Work in the Dry – Cofferdams;
- Fact Sheet on Streambank Stabilization;
- Fact Sheet on Instream Work in the Dry – Temporary Diversion;
- Fact Sheet on Instream Work in the Dry – Elevated Pipes;
- Fact Sheet on Culvert Stabilization;
- Fact Sheet on Storm Drain Outlets;
- Fact Sheet on Temporary Settling Basins;
- Fact Sheet on Bridge Construction/Demolition;
- Fact Sheet on Freshwater Salmonid Habitat Requirements;
- Fact Sheet on Highway Construction/Upgrading – Infilling, Stabilization and No-Grub Zones;
- Fact Sheet on Freshwater Intake End-of-Pipe Fish Screen;

- Fact Sheet on Stream Clean-up;
- Fact Sheet on Timber Crib;
- Fact Sheet on Water and Sewer Installation – Stream Crossings;
- Fact Sheet on Culvert Installation; and
- Fact Sheet on AVTs, Fish Habitat and You

Other Pertinent Federal Documents

TABLE of CONTENTS

1 PURPOSE

The purpose of this procedure is to define the responsibilities and methodology required to control the submission of Supplier/Contractor technical documents identified in the Supplier/Contractor Documents Requirements List (SDRL) as required for the Lower Churchill Project (LCP). This includes coding of technical documents and submission process for documentation being reviewed through to final handover.

2 SCOPE

This procedure applies to all Supplier/Contractors that provide goods or services for the Lower Churchill Project. The Supplier/Contractor shall transmit all documentation to LCP Document Control (LCPDCC) using LCP Aconex transmittal.

This procedure will provide all the details and submission requirements for Supplier/Contractor technical (revision controlled) document and drawing deliverables as listed on the approved SDRL defined for the project scope of work.

3 DEFINITIONS

Aconex	Electronic Document Management System which is a secure on-line platform for storing, managing and distributing project information for the Lower Churchil Project.
As-Built Documentation	Technical (Revision Controlled) Documentation where mark-up information has been formally incorporated into a new revision of the original document.
CA	Contract Administrator is responsible for managing the Agreement and Contract Administration from Award through to Completion.
Documentation	Documentation is any communicable material that is used to describe, explain or instruct regarding some attributes of an object, system or procedure, such as its parts, assembly, installation, maintenance and use.
Supplier/Contractor	Firm, corporation, organization, company, etc. with a scope of work under a purchase order, contract or agreement for the LCP.
SDRL	Supplier/Contractor Document Requirements List indicates the document and data requirements, timing of submissions, types of review, as-built requirements, handover deliverables and any requirements for inclusion in final documents/manuals.

SDRL Code	A 3-character alpha-numeric code representing document types. e.g.: B01 = General Arrangement and Layouts.
SDR (A01)	Supplier Document Register (A01) - documents list identifying individual document deliverables by purchase order. This register will capture deliverable requirements as agreed by Contractor/Supplier and Company. Contractor/Supplier is responsible to create and approve this document as a revision controlled document.
OCR	Optical Character Recognition is text recognition software (Adobe Standard) that is used to convert electronic files to PDF format.
Portable Document Format (PDF)	Portable Document Format (PDF) is a file format used to represent documents in a manner independent of application software, hardware, and operating systems. Each PDF file encapsulates a complete description of a fixed-layout flat document, including the text, fonts, graphics, and other information needed to display it.
Supplier/Contractor Documents	Documents that a Supplier/Contractor issue to LCPDCC for Review and Acceptance by LCP Project Team such as drawings, parts list, calculations, procedures, reports and manuals pertaining to the contract, purchase order or agreement.
Red-line drawing	A red-line drawing is essentially an intermediate drawing that shows corrections or changes to a previous drawing. The term red line literally comes from the (typically) red pen used to amend the drawings by hand. These mark-ups show changes made to the drawing subject matter during the manufactuer or construction of the product. Red-lines are used to then develop record drawings. Record drawings, also called "as-builts" accurately reflect what was constructed and are used for future work and/or reference.
Retained Documentation	Documents/Drawings which are designated to be held by the Supplier/Contractor for a designated period of time.
Responsible Lead / Package Engineer (PE)	The person who is responsible for the package awarded to Supplier/Contractor and Interdisciplinary Coordination (IDC) Review of Supplier/Contractor Documents.
Revision Controlled Documents	A document deliverable resulting from a service related contractual relationship or a Supplier/Contractor document created in support of engineering, construction, procurement, manufacture, preservation, installation, commissioning and operation.

LCPDCC	Lower Churchill Project Document Control Centre.	
Starter Kit Templates	LCP-PT-MD-0000-IM-FR-0001-01	Document Front Sheet for Suppliers/Contractors
	LCP-PT-MD-0000-IM-FR-0002-01	Drawing Templates for Suppliers/Contractors
	LCP-PT-MD-0000-IM-FR-0003-01	SDR Template (A01)
	LCP-PT-MD-0000-IM-FR-0004-01	Installation, Commissioning, Operations and Maintenance Table of Contents Template
	LCP-PT-MD-0000-IM-FR-0005-01	Manual Binder Spine Templates for Final Documentation
	LCP-PT-MD-0000-IM-FR-0006-01	Manufacturing Record Book Table of Contents Template
	LCP-PT-MD-0000-IM-FR-0008-01	Dispatch Dossier Table of Contents Template
	LCP-PT-MD-0000-IM-FR-0009-01	Manual Binder Cover Pages for Final Documentation
	LCP-PT-MD-0000-IM-FR-0010-01	Major Equipment and Supply Chain Information
Superseded	The information from a document that is now to be found on another document. Contractors/Suppliers are to make the appropriate cross-references both on the superseded document and the Supplier Document Register.	
Transmittal	Tracks and establishes a history of documentation transfer to and from Suppliers/Contractors through Aconex.	
Void	The information on the document/drawing is no longer valid and/or in use.	

ICOM (R01)	Installation, Commissioning, Operating and Maintenance Manual – an organized compilation of documents and data as per the following sections: 1. Installation section shall include all erection/assembly drawings, instructions as to the use of special tools provided, tolerances allowed on setting dimension, handling and unpacking instructions. Also includes quantities of preservatives and fluids required for shipment. 2. Commissioning section shall include list of spare parts, special tools and utilities required, pre-commissioning checks to be performed, sequenced procedure for dynamic commissioning and start-up and fault finding guidelines. Copies of all relevant drawings shall be included. 3. Operating section shall include description of equipment, operating procedures for start-up, steady state, shutdown, emergency and fault conditions, operating parameters, function of protective devices and controls, copies of all relevant cause and effect charts and block diagrams, and fault finding guidelines. 4. Maintenance section shall include instructions for maintenance disassembly, repair/overhaul and reassemble, schedule of preventative maintenance/maintenance frequencies.
MRB (R02)	Manufacturing Record Book is an organized compilation of construction, manufacturing, installation, testing, reporting and certification documentation required to demonstrate that constructions, equipment materials and fabricated systems and units are in compliance with the statutory regulations and specified requirements.
DISPATCH DOSSIER (R05)	Dispatch Dossier shall mean all those documents required, as a minimum to accompany goods released to site from Contractors/Suppliers and Fabricators. Procured goods shall not be dispatched without Dispatch Dossier. Also includes quantities of preservatives and fluids required for shipment.
TRAINING MANUAL (R06)	Operator and Maintenance training manual shall be a separate document that contains detailed training information developed by the Supplier/Contractor from the documents prepared for the project (e.g.: drawings, manuals, spare parts, BOM's etc).

4 RESPONSIBILITIES

Contractors/Suppliers – Are responsible to be completely aware of and follow the requirements herein. Supplier/Contractor shall have a designated Document Control contact person responsible for Aconex setup and coordinate contractual submissions to LCPDCC. Supplier/Contractor shall create and submit all required documentation as per the stipulations of this document.

LCP Document Control (LCPDCC) Team – Is responsible for clarifying the requirements where necessary as well as the receipt, standard Document Control quality checking and management of the documentation submitted to LCP by the Supplier/Contractor.

LCP Document Control (LCPDCC) Centre – is responsible to manage and process Supplier/Contractor document submittals in accordance with this document. Email LCPDCC@lowerchurchillproject.ca

LCP Responsible Lead/Package Engineer – is responsible for coordinating and identifying the distribution, review/approval cycles, and providing guidance for the management of technical documents including:

- Establish and Control of Review and Distribution Matrices
- Control the Inter Discipline Coordination (IDC) review of documents for assigned work package(s) on the project.
- Resolve the issues that may occur internally during the IDC review of Supplier/Contractor documents.
- Incorporate the comments and assign review status from the IDC review of Supplier/Contractor documents.
- Sign off the Supplier/Contractor documents.
- Submit the Supplier/Contractor documents to LCP Document Control Center (LCPDCC), who will issue them to the Supplier/Contractor.

LCP Contract Administrator - Responsible for managing the contract requirements and obligations with the Supplier/Contractor.

6.0 INTRODUCTION

The objective of this document is to define the requirements for Suppliers/Contractors to submit documentation and drawing to the LCP project team from creation to completion/turnover.

6.1 SUPPLIER/CONTRACTOR DOCUMENT REQUIREMENTS LIST (SDRL) AND DOCUMENT REGISTER (SDR)

All potential Suppliers/Contractors will be provided a project specific SDRL and associated templates as part of the initial Bid Package. This SDRL forms the basis of the contractually required document deliverables. The SDRL is necessary to produce the SDR also known as the A01 on the SDRL.
Upon award, the SDR (A01) document should be completed by the Supplier/Contractor to include a complete list of required document deliverables as agreed in the SDRL. Each listed deliverable should have an associated forcasted submission date, etc. The SDR is to be submitted as defined on the SDRL.

Supplier/Contractor shall submit a completed SDR (A01) form (LCP-PT-MD-0000-IM-FR-0003-01) indicating the document deliverables to be supplied per the Purchase order/Agreement's specific SDRL.

The SDR (A01) shall always be the first document produced and delivered within two weeks after award of contact or purchase order. This document register is subject to review and acceptance by LCP and identified as SDRL code A01.

Once the SDR (A01) has been agreed with the LCP Responsible Lead/Package Engineer, the Supplier/Contractor shall maintain the SDR (A01) until contract closeout and issue in Aconex on a monthly basis with any and all updates.

The SDR (A01) shall be completed as follows:

1. The Document/Drawing numbers shall be assigned in accordance with Section 6.2.
2. Document Title.
3. If at the time of the initial submission of the SDR (A01) specific titles cannot be identified, the Supplier/Contractor shall contact the LCP Responsible Lead/Package Engineer for clarification.
4. In conjunction with LCP document coding, the Supplier/Contractors may reference their own document number and revision sequence (where applicable).
5. Include the planned submission date per the SDRL requirements.

Once a document has been submitted per the SDR (A01), the document number shall not be re-used. If a document is superseded or made void, this shall be stated clearly in the SDR (A01). Same if the placeholder is cancelled, it shall be clearly stated on the SDR.

6.2 DOCUMENT/DRAWING CREATION

All Supplier/Contractor document/drawing numbers will be reserved by LCPDCC after approval of SDR (A01), in accordance with the Coding Standard, LCP-PT-MD-0000-IM-SD-0001-01 for the Lower Churchill Project. All reserved document/drawing numbers or place holders will be transmitted via Aconex.

Electronic documentation submitted by the Supplier/Contractor for review must be in the text searchable PDF format OCR (Adobe Standard Software).

Electronic documentation may also be required in native format for integration into design development. Specific requirements and exceptions will be outlined in the package specific Supplier/Contractor Documents Requirements List (SDRL).

All documents in letter (size 8-1/2 in x 11 in) and legal (size 8-1/2 in x14 in) shall include the Document approved LCP Front Sheet for Suppliers/Contractors - LCP-PT-MD-0000-IM-FR-0001-01 as the first page of each document.

Electronic files shall be limited to one file per document/drawing. Where there are multiple files, a unique and logical reference would need to be applied. Please note: a document with multiple pages submitted as a single document is reviewed as one document. Any revisions to a particular page or sheet of the document shall require the complete document to be resubmitted with the next revision. Partial submissions will not be accepted.

All drawings shall be created and delivered on standard paper sheets. All drawings should also be defined with a border and no markings shall be permitted outside the border. Drawing notes shall be positioned in a column at the right hand side of the drawing.

Drafting standards shall be in compliance with the project symbol requirements.

The following tables describe the accepted drawing formats and scales to be used on the Lower Churchill Project.

Table 1 – Acceptable Drawing Sizes

STANDARD		DIMENSIONS		PROJECT REQUIREMENTS
ISO 216 (Metric)	A0		841 mm x 1189 mm	X
	A1		594 mm x 841 mm	X
	A2		420 mm x 594 mm	X
	A3		297 mm x 420 mm	X
	A4		210 mm x 297 mm	X
ANSI Y14.1 (Imperial)	E	34 in x 44 in		X
	D	22 in x 34 in		X
	C	17 in x 22 in		X
	B	11 in x 17 in		X
	A	8.5 in x 11 in		X

Table 2 – Accepted Drawing Scales

Type of Drawing	Metric Scales
Topography	
General, Hydrology, Topography	1:20 000 1:10 000 1:5 000 1:2 000 1:1 000
Plans and Profiles	1: 500 1:200 1:100
Building Drawings	
Location Plan, Key Plan	1:10 000 1:5 000
Site Plan, Layout Plan	1:2 000 1:1 000 1: 500
General Layout Drawing, Plot Plan	1:500 1:200 1:100
Layout Drawing (general or partial)	1:100 1:50
Detail and Assembly Drawings	1:30 1:20 1:10 1:5 1:2 1:1

6.2.1 REVISION STATUS

All documents and drawings require a revision status upon submission. The first submission will be submitted as revision status of A1 – Issued for Review, unless otherwise ageed to by the LCP Responsible Lead/Package Engineer. All A1 documents are to be resubmitted at revision B or higher **and** achieve a Review Code 01 to be considered ready for use.

All drawing revisions shall be shown by a “cloud” surrounding the area with revision symbol. The revision symbol shall be a triangle with revision letter/number inside. Note of the revision are to be made in the title block of the drawing. Clouds are not to cover portions of the drawing which has not been revised.

Previous revision symbols and clouds are to be removed and only current revision shall be shown when a drawing is re-issued.

Revision Status are as follows:

A – IDC – Issued for review
B – Approved for Use/Implementation/Bid
C – Approved for Purchase/Construction/Fabrication
D – Approved for Design
L – As-Built/Final
N – Cancelled
S – Superceded
V – Void

If a drawing or document is to required to be voided, it must be VOIDED in its entirety and then issued at the next submission as a V status. VOID shall be written within parallel lines across the full drawing or the first page of a document and authorized by the LCP Responsible Lead/Package Engineer.

If a document or drawing is required to be superseded meaning the information on the existing document/drawing has been re-located to another document/drawing, the Contractor/Supplier is to make the appropriate cross-references on the superseded document and show a revision status of S to represent that the information has been superseded and issued S1.

All changes in revision statuses must be reflected on the SDR upon the next monthly submission.

6.2.2 TAG NUMBERS

The purposes of tagging and numbering are for the work protection code process, for asset management by identifying individual equipment in the different project facilities, and for the procurement of equipment and material, including bulk material. Reference Engineering - Service Codes and Equipment Tagging - LCP-SN-CD-0000-EN-PR-0002-01.

Tag numbers shall be used and clearly identified on all Supplier/Contractor documents to facilitate rapid and efficient identification of the equipment throughout LCP.

For equipment items with tag numbers, the tag number must be placed on the drawing and in proximity to the item so there is no confusion which tag belongs to which item.

6.3 DOCUMENT AUTHORIZATION

The Supplier/Contractor shall be responsible to ensure that:

1. All necessary checking, authorization and acceptance of their documents is performed prior to submittal to LCPDCC;
2. All the Supplier/Contractor documents are submitted via the LCP Aconex System to LCPDCC and never sent directly to the LCP Responsible Lead/Package Engineer or LCP Contract Administrator; and
3. The Sub-Supplier/Sub-Contractor documents are to be complete and integrated in a logical manner with those being provided by the Supplier/Contractor and shall be accepted by supplier/contractor prior to submission to LCP team.
4. All documentation/drawings are of good quality.

6.4 SUBMISSION OF SUPPLIER/CONTRACTOR DRAWINGS AND DOCUMENTATION

Upon award of the contract/purchase order, the LCP Contracts Administrator/Buyer will request the contact name, email address and phone number of the Supplier/Contractor's Document Control representative. An email will be sent to the representative by LCPDCC advising of the required steps to creating an Aconex user account(s). This includes:

1. Setting up their organization with Aconex directly.

2. Providing accounts to your internal team members

3. Contacting the LCPDCC representative to add you and your company participants to the applicable LCP databases in Aconex and submit the required Aconex presentation, online tutorial, forms and any other relevant information.

4. Participating in project specific training with your Document Control representative. Example: Uploading Documents to Aconex.

All document/drawing numbers must be reserved prior to submission, which will be developed and approved from the Supplier/Contractors SDR (A01). The assigned document/drawing numbers shall be processed electronically via Aconex approved metadata placeholder and issued by LCPDCC to the Supplier/Contractor by Aconex transmittal. Any document or drawing received without an assigned number will not be processed.

The dates shown for documents to be submitted on the SDR (A01) shall be the forecasted date of arrival at the LCPDCC via the electronic document management system (Aconex). The forcasted date shall be in accordance with the expected dates as defined in the SDRL.

If hardcopies of documents are required to be submitted in addition to the electronic submission via Aconex a copy of the transmittal to be submitted with the hardcopy and sent to LCPDCC team as follows:

Nalcor Energy
Project Delivery Team
Lower Churchill Project
350 Torbay Road, Suite 2
St. John's, Newfoundland
A1A 4E1
Attention: LCP Document Control

6.4.1 QUALITY OF DOCUMENTS UPON SUBMITTAL

Typically, all documents are issued electronically as searchable Optical Character Recognition (OCR) PDF documents. All pages of documents and drawings shall be of correct orientation, legable, with all required content, numbered correctly as requested through the SDR and assigned by Aconex. Both documents and drawings should include the correct revision, dates, signatures and stamps (if required). All pages of a document should be numbered correctly and consecutively with no blank pages. All documents/drawings shall be in the English language.
All dates referenced shall be in the format dd-mmm-yyyy (eg: 17-May-2013)

6.4.2 REVIEW OF DOCUMENT AND DATA

Review and comment by the LCP Responsible Lead/Package Engineer/LCP Contract Administrator or conversely, the failure to review, shall not imply acceptance or relieve the Supplier/Contractor of any responsibility or liability for dimensional or functional accuracy or completeness of such data, or the equipment being supplied.

The LCP Responsible Lead/Package Engineer/LCP Contract Administrator shall review in accordance with the Procedure for Issuance of Revision Controlled Documents for Internal Review & Acceptance - LCP-PT-MD-0000-IM-PR-0009-01 and returned to the Supplier/Contractor within the terms of the Purchase Order/Agreement.

6.4.3 RETURN OF SUPPLIER/CONTRACTOR DOCUMENTS

The LCP Responsible Lead/Package Engineer shall assign to each of the Supplier/Contractor document submitted, one of the Review Codes as as listed below:

Code 01 - Reviewed and Accepted – No Comments
Code 02 - Reviewed – Incorporate Comments, Revise and Resubmit
Code 03 - Reviewed – Not Accepted
Code 04 - Information Only
Code 05 - Not Reviewed

6.4.4 RESUBMISSION OF SUPPLIER/CONTRACTOR DOCUMENTS.

All documents submitted/resubmitted for review shall have achieved Review Status Code 1 or 5 or have been made void/cancelled at Purchase/Agreement closeout.

Once code 01 has been received, LCP Package Engineer will request a B1 or C1 to be issued by Supplier/Contractor. Resubmission of document assigned Return Code 02 and 03 is required before being considered suitable to proceed with the work. The Supplier/Contractor has 14 calendar days or unless otherwise specified in the contract from receipt of comments to resubmit the document

Any documents modified after acceptance at Code 01 or 05 must be resubmitted for review/acceptance.

On each subsequent submission of same documentation previously reviewed by LCP, the Supplier/Contractor shall use the applied same unique number but different revision as per LCP Coding Standard. If on the next submittal of a document where the previous submittal has not yet been returned then the Supplier/Contractor shall consult with LCP Responsible Lead/Package Engineer prior to issuing the revised document.

All drawing revisions shall be shown by a “cloud” surrounding the area with revision symbol. The revision symbol shall be a triangle with revision letter/number inside. Note of the revision are to be made in the title block of the drawing. Clouds are not to cover portions of the drawing which has not been revised. Previous revision symbols and clouds are to be removed and only current revision shall be shown when a drawing is re-issued.

6.4.5 RED-LINES

Red-Lines will be required as directed by the LCP Responsible Lead/Package Engineer. This may include all or none of the company supplied documents.

6.4.6 AS-BUILT/FINAL DOCUMENTS

The SDRL template provides the LCP Responsible Lead/Package Engineer identification of the As-Built requirements. The Supplier/Contractor shall ensure that the final status of the documents reflects only those documents that need updating to reflect their accurate final status, need to be submitted:

a) The "As-Built/Final" status shall be provided for materials/equipment/construction.
b) Where subsequent modifications have been undertaken to materials/equipment/construction provided these are reflected in the final documents.
c) Shall be issued at a revision status of “L”

At the completion of the Purchase/Contract, all documents shall reflect the "As-Built/Final" status of the service, and the Supplier/Contractor shall include the following paragraph in the Final Stage Payment Certificate:

"We the Supplier/Contractor certify that all documents supplied in association with the above Purchase/Contract fulfill our contractual requirements and reflects the "As-Built/Final" status.”

“As built” drawings, shop drawings and material lists shall be forwarded no later than 14 calendar days or unless otherwise specified in the contract after the end of fabrication.

6.5 MANUALS

6.5.1 PRELIMINARY ISSUE

The templates provided are for guidance with the final content being agreed with the LCP Responsible Lead/Package Engineer.

Installation, Commissioning, Operations and Maintenace Manual (ICOM) Table of Content - LCP-PT-MD-0000-IM-FR-0004-01
Manufacturer’s Record Book (MRB) Table of Content - LCP-PT-MD-0000-IM-FR-0006-01
Dispatch Dossier Table of Content - LCP-PT-MD-0000-IM-FR-0008-01

<u>Preliminary Submittal</u>

After approval of the Table of Contents, the Supplier/Contractor must submit electronically and in one file, the first submittal of the complete manual in an OCR enabled PDF format for review.

Note: Adobe OCR Documents preserve the fidelity of the original files and are more reliable and easier to use because they retain the fonts, images, graphics, and layout of any source file regardless of the application and platform used to create them. Adobe OCR Documents can lock down content to create

easily searchable, auditable documents of record. Bookmarking shall also be applied based on the Table of Content.

6.5.2 FORMAT FOR MANUALS

The Supplier/Contractor shall submit all manuals in English.

Material shall not be submitted in loose form but shall be completely fastened together and bound in a rigid binder. Binder size maximum of 4" D- size to be used ensuring ½" of space is available so not to restrict the turning of pages. Document to be printed double sided where possible to reduce the number of binders required.

Professional-quality presentation binder that has 3 secure locking rings and a clear view cover that folds back for easy insertion of the Manual Binder Cover Page for Final Documentation - LCP-PT-MD-0000-IM-FR-0009-01 and spine label holder for the Manual Binder Spine Templates for Final Documentation LCP-PT-MD-0000-IM-FR-0005-01. Binders must have 2 inside pockets for filing CD or DVD and a D-Ring mechanism, complete with triggers, for easy access.

The number of hardcopies per manual are as follows:

- R01 - ICOM - three (3) hard bound copies upon handover.
- R02 – MRB - electronic version and the supplier/contractor to keep original hardcopies for traceability and auditing purposes – three (3) hard bound copies upon handover.
- R05 – Dispatch Dossier – three (3) hard bound copies – one to be delivered to site with the equipment/goods and the other 2 to be sent to LCPDCC Document Control Centre.
- R06 – Training Manual – three (3) hard bound copies upon handover.

6.5.3 ELECTRONIC COPY

Electronic copy shall be submitted using Aconex transmittal process.
Special Note: Electronic and hard copy must be identical

The final submission of the manuals shall include;

- Two (2) copies of each DVD (Master and Backup)
- All drawings submitted with final manuals shall be As-Built and original drawing along with the .dwg electronic native format or other Company approved formats as applicable.
- Electronic versions of all manuals shall be provided in PDF File Format and in their original Native Electronic File Format. There shall be one PDF file for each manual and multiple PDF files for one Manual will not be accepted.
- PDF File formats shall be in one OCR file using Adobe Acrobat software

- Native electronic files shall be submitted in Microsoft 2000 or higher electronic format (with each electronic file clearly identified according to its proper location in the manual based on the table of contents).

Upon confirmed approval by the LCP Responsible Lead/Package Engineer on the final version of Manuals, the Supplier/Contractor shall prepare the final version of Manuals in DVD Format, the procedure for which is described below. The Supplier/Contractor shall submit two (2) copies of each DVD, one marked “MASTER”, and the other marked “BACKUP”. Each DVD shall have a label with details including and not limited to “Project Document Number”, “Project Title” & “Agreement/PO Number”. Each DVD shall be of good quality and shall be virus checked before submission to the LCP Responsible Lead/Package Engineer for final acceptance.
The Manuals in DVD format shall be created in a format known as “Portable Document Format” (PDF) using Adobe Acrobat Writer 8.0 or latest software for Windows XP. The DVD shall be self-executing and the software for the operation of the DVD is Adobe Acrobat Reader for Windows XP which shall be delivered as part of the DVD Operating System. Adobe Acrobat Reader allows the PDF files to be viewed, printed and navigated.

DVD format requirements shall be:

- Electronic documents shall be converted from the native file to PDF image files using Adobe Acrobat Writer 8.0 or higher.
- Non-electronic documents shall be scanned to minimum 300 dpi (Dots per Inch) and converted from the original format to PDF using Adobe Acrobat Writer 8.0 or higher.
- Create the folders to match the table of contents
- Create bookmarks to identify chapters and sections and thumbnail for pictures and images.

6.5.4 TRAINING MANUAL (R06)

Operator and Maintenance training manual shall be a separate document that contains detailed training information, developed by the Supplier/Contractor from the documents prepared for the project (eg: drawings, manuals, spare parts, BOM’s etc).

Manual Front Page and Spines
Document Front Sheet for Suppliers/Contractors
Title of the Project- Lower Churchill Project
Project Contract Number and description of Work
Manual Nalcor Document Number and Revision
Name and Address of Main Supplier/Contractor and Sub-Supplier/Contractor
Volume No. of Manual

6.5.5 FINAL SUBMISSION OF MANUALS

The Supplier/Contractor shall submit to the Lower Churchill Project a complete electronic PDF version as well as hard copy(s) of the complete set of manuals to the following address:

Nalcor Energy
Project Delivery Team
Lower Churchill Project
350 Torbay Road, Suite 2
St. John's, Newfoundland
A1A 4E1
Attention: LCP Document Control Centre

One electronic PDF version must be uploaded and submitted via transmittal using the Lower Churchill Project Aconex System.

Prior to final issue of the ICOM it is recommended that the LCP Responsible Lead/Package Engineer meet the Supplier/Contractor to review the manual to prevent repetitive issues and the requirements described below have been met. All other manuals are to be submitted for acceptance via Aconex for approval prior to submitting final version.

6.6 COMPONENT SPECIFIC REQUIREMENTS

6.6.1 HYDRO – GENERATION – COMPONENT 1 - 3D MODEL CATIA

As part of the scope of the Lower Churchill Project the Hydro Generation Component 1 will be developing a 3D Model. CATIA by Dassault System is the software used to develop this model.

To meet this requirement, equipment Supplier/Contractor are required to provide a 3D representation of the facilities and equipment that are being provided in CAT.PART format or STEP or IGES compatible with CATIA.

3D models provided in formats other than the above require validation and approval from the company prior to submission.

Electronic Copy drawings shall be provided in DWG (AutoCAD), CAD Drawing and PDF format.

6.6.2 TRANSMISSION LINES, TOWERS AND FOUNDATIONS – COMPONENT 4 - 3D MODEL PLS

Transmission lines

The transmission line designs are completed with the use of the PLS-CADD software (PLS Systems Inc.)

All sag/tension reports, stringing charts and plan and profile sheets are produced with PLS-CADD. All vector loads for each loading cases and line angle are produced with the PLS-CADD/LITE software

Towers

The tower designs are completed with the PLS-TOWER software. The supply of tower shall include the updated PLS-TOWER models, compatible with the PLS-CADD software. The PLS-TOWER backup file shall be supplied. Each tower type will be supplied with the full set of PLS-TOWER models. For each tower type, a PLS-TOWER model shall be supplied for each of the tower height, at each 1.5m increment, from minimum tower height to maximum tower height.

Foundations

The steel grillage foundation designs are completed with the SAP2000 software. The supply of the grillage foundation type shall be supplied with the updates SAP2000 models, including the tower foundation loads as defined by the PLS-TOWER software.

7.0 PROJECT SPECIFIC INSTRUCTIONS

To ensure efficient handling of drawings and other documents, Supplier/Contractor shall abide by the following rules:

- All drawings to be produced using the LCP Drawing Templates for Suppliers/Contractors - LCP-PT-MD-0000-IM-FR-0002-01. It is acceptable for the Supplier/Contractor to place its complete drawing within the LCP drawing frame.
- A document with multiple pages submitted as a single document will be reviewed as one document. Any revisions to a particular page or sheet of the document shall require the complete document to be resubmitted with the next revision assigned.
- When a Section is shown on a separate drawing sheet, the Plan drawing number shall be included in the Section identification.

- Reference drawings shall be tabulated in the “Reference Drawing” section at the bottom of the drawing. Equipment/nozzle tabulation on General Arrangements (GA) shall be on the right side of the drawing.
- Drawings produced must be submitted as a complete drawing file. This means all drawing files must be bound to include all relevant information. This is necessary to properly access/view and use the drawing.
- Documents identified as requiring the Engineer’s Seal and Signature will be in accordance with the Newfoundland and Labrador Professional Engineers and Geoscientists Act. Refer to www.pegnl.ca.
- Supplier/Contractors shall ensure that all documents involved in the provision of architectural services, when issued, shall bear the signature and seal of the architect who prepared or approved them as per The Architects Act of the province of Newfoundland and Labrador.

MAINTENANCE OF THE WASTE MANAGEMENT PLAN (WMP)

This *WMP* will at times require updating in response to changes in the Project, Contractor work methods, group structure, or technological advancements that provide a higher level of environmental protection. The subsections below indicate the process with respect to maintenance and implementation of the *WMP.*

Initiating Revisions

This *WMP* is a controlled document and revisions may only be processed by SNC Lavalin's (SLI's) Environmental Manager. It is anticipated that most of the revisions to this *WMP* will be initiated by the environmental management team at the site or at the Lower Churchill Project office in St. John's.

Nalcor staff shall request revisions through document control. *WMP* holders and readers/reviewers (within SLI, government agencies, contracting firms, other stakeholders, etc) may request revisions by forwarding a completed Revision Request Form (RRF), provided in Section 12, to SLI's Environmental Manager. These revision requests will be screened and reviewed by SLI in conjunction with Nalcor staff, and forwarded to SLI's Project Manager for approval.

Compliance Instructions

Revision requests that have been accepted by SLI's Project Manager will be sent to SLI's Environmental Manager for distribution to key Project participants as "Compliance Instructions" These instructions shall be signed off by key holders of the WMP and returned within two days of receipt. A log of compliance instructions shall be maintained by SLI's Environmental Coordinator (Hydro), and these will be incorporated periodically into a revised edition of the WMP

Revision Procedures

Revisions to the Waste Management Plan shall be made annually, or as required, in accordance with SLI's document control procedures. SLI's Environmental Manager

will issue the accepted revisions of the Waste Management Plan to key holders, Contractors, and readers/reviewers. Each revision will be accompanied by a Revision Control Record (provided in Section 12) that:

a) identifies all compliance instructions that have been issued since the last revision; and

b) Lists the sections being superseded.

Within two working days of receiving a revised Plan, *WMP* holders shall:

a) Familiarise themselves with revised sections of the *WMP*;

b) Incorporate all revisions into their areas of responsibility, as appropriate;

c) Ensure that all personnel are familiar with the revisions; and

d) Acknowledge receipt of the revised *WMP* by forwarding via fax, email, or mail a signed and dated acknowledgement form to SLI's Environmental Manager. The receipt of revision acknowledgement form is located in Section 12.

1 INTRODUCTION

This *Waste Management Plan (WMP)* is developed to establish safe, efficient and environmentally compliant waste management during construction and commissioning activities of the Lower Churchill Project (LCP). This plan outlines the roles and responsibilities that all Project participants must follow to ensure that the collection, storage, transportation and disposal of all wastes generated during construction and commissioning activities of the LCP is managed in an environmentally sound manner.

1.1 PURPOSE

Specifically the purposes of this *WMP* are to:

a) comply with the conditions and requirements of Environmental Assessment (EA) release;

b) outline the Lower Churchill Project's commitments to minimize potential environmental effects - including commitments made in the Environmental Impact Statement (Nalcor, 2009) and during the regulatory review process under the joint review panel;

c) manage potentially adverse impacts on the environment and protect the health and safety of site personnel (including Contractors, Subcontractors/vendors and visitors);

d) provide a reference to applicable legislative requirements and guidelines;

e) provide a reference document for Lower Churchill Project participants to use when planning and/or conducting specific procurement, construction and commissioning activities with respect to waste management;

f) provide a detailed summary of waste management issues and measures to be implemented during construction and commissioning;

g) provide direction for environmental orientation programs for Lower Churchill Project participants; and

h) communicate changes to the *WMP* through an interactive revision process;

The intent is to afford a high degree of control over the handling of waste and to implement the ideals of the three R's namely reduction, recovery/reuse and recycling of wastes. Ultimately this plan will help to minimize potential adverse environmental effects and provide a framework for those involved in the Project.

This document will be reviewed on an annual basis (or as deemed necessary by SLI or Nalcor) throughout the construction phase and updated as necessary to accommodate the dynamics of design and construction as it progresses.

1.2 SCOPE AND APPLICATION

The scope of this *WMP* covers the engineering, procurement, construction, and commissioning phase of the Lower Churchill Project for Components 1 and 4b. The focus of this plan is on construction and commissioning activities for the site access roads, reservoir preparation, accommodations and administrations complex, laydown areas, AC line from Muskrat Fall to Churchill Falls, and the Muskrat Falls hydroelectric generating facility. Section 2 describes the Project in more detail. Note that the cable crossing at the Strait of Belle Isle and the Labrador Island Transmission Link are not within the scope of this WMP.

This WMP is one component of the Lower Churchill Project's *Environmental Management Plan (SLI Document # 505573-0000-68RA-I-0004, NE-LCP Document # MFA-SN-CD-0000-EV-PL-0001)*. Other subordinate documents of the Environmental Management Plan include the following:

a) *Contract-Specific Environmental Protection Plan (*C-SEPP*) Template (SLI Document # 505573-0000-68RA-I-0011, NE-LCP Document # LCP-SN-CD-0000-EV-PL-0006-01)*

b) *Rehabilitation Plan (RP) (SLI Document # 505573-0000-68RA-I-0007, NE-LCP Document # LCP-SN-CD-0000-EV-PL-0004-01);*

c) *Regulatory Compliance Plan (RCP) (SLI Document # 505573-0000-68RA-I-0003, NE-LCP Document # LCP-SN-CD-0000-RT-PL-0001-01); and*

d) *Project-Wide Environmental Protection Plan - Component 1 and 4b (SLI Document # 505573-0000-68RA-I-0005, NE-LCP Document # LCP-SN-CD-0000-EV-PL-0002-01)*;

Nalcor's Emergency Response Plan is a companion document to the Environmental Management Plan. It contains a Master Spill Response Plan, which shall be used by contractors as a basis for preparing their own spill response plans.

This *WMP* applies to all Project participants, including Nalcor, SLI, Contractors, Subcontractors, suppliers, service providers, and all employees of these organizations.

Given the Lower Churchill Project's magnitude, accepted *Contract-Specific Environmental Protection Plans (C-SEPPs)* shall be required. C-SEPP*s* shall be prepared by all contractors for all construction contracts to ensure that effects on the environment are minimized to the extent practical. These C-SEPP*s* shall provide sufficient detail on the Contractor's:

a) Scope of work;

b) Methods of construction;

c) Sequence of activities;

d) List of resources (i.e. equipment and site workforce);

e) Temporary and permanent installations;

f) Environmental protection procedures and alternative procedures, if required; and

g) Environmental contingency measures.

One aspect of the C-SEPP will be how the Contractor proposes to handle the waste from their activities.

This *WMP* will serve as a resource to Contractors as they prepare their own *C-SEPPs.* Contract packages shall include the C-SEPP template, with specific instructions on how these templates are to be properly completed. All C-SEPPs shall require approval by both SLI and NE-LCP prior to the contractor's mobilization to site.

2 PROJECT DESCRIPTION

2.1 MUSKRAT FALLS HYDROELECTRIC DEVELOPMENT AND AC TRANSMISSION LINE (COMPONENT 1 AND 4B)

Muskrat Falls is one of two hydroelectric developments being planned for the lower Churchill River. The remotely controlled nominal 824 MW Muskrat Falls Hydroelectric Development will be composed of the following sub-components and associated ac connector lines to an ac switchyard:

a) 16 km of permanent access roads, including upgrading of existing roads and new construction;

b) Reservoir, approximately 60 km long and 101.4 km^2 in total area;

c) Replacement fish habitat;

d) A north roller compacted concrete (RCC) overflow dam;

e) Gated spillway including:

   i) Approach and discharge channels; and

   ii) Vertical lift gates.

f) A close coupled intake and powerhouse including:

   i) intakes with gates and trash racks;

   ii) concrete lined water passages;

   iii) turbine/generator units at approximately 206 MW each with associated ancillary electrical/mechanical control equipment;

   iv) power transformers (includes 1 spare), located on the draft tube deck of the powerhouse; and

   v) 2 overhead cranes;

g) A south dam;

h) Component diversion works (i.e. cofferdam and spillway for diversion channel);

i) Stabilized north spur;

j) ac switchyard at Muskrat Falls; and

k) Churchill Falls switchyard extension.

Figure 2-1 shows the current concept for the generating facility.

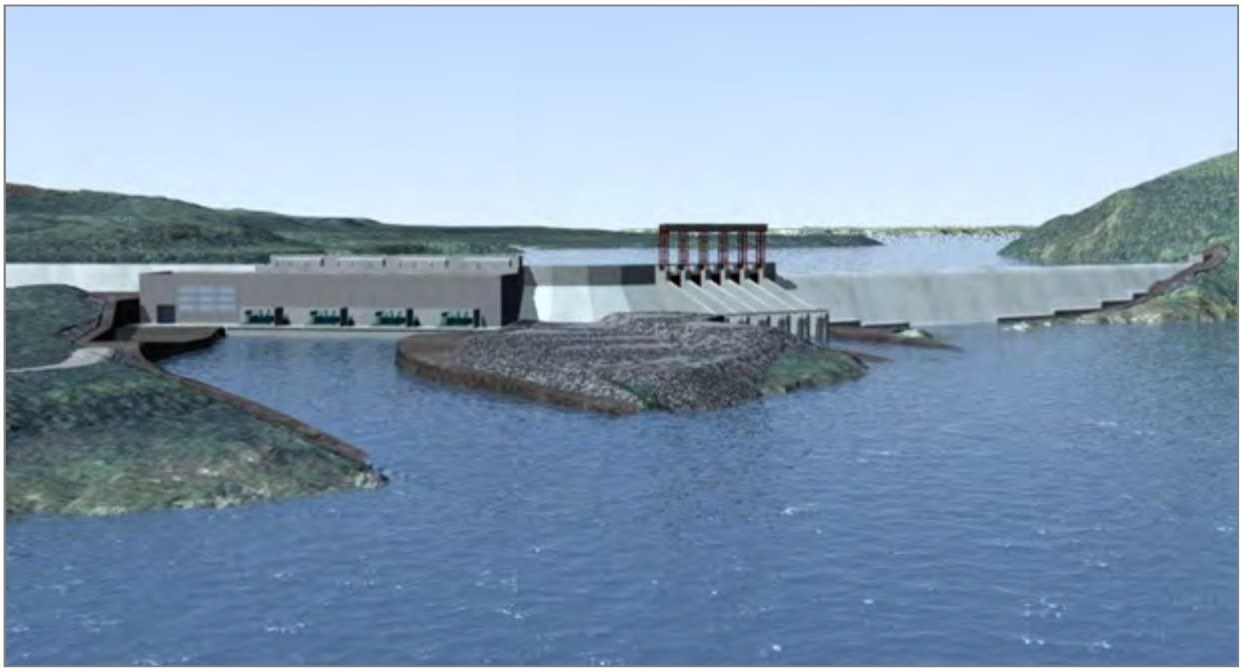

Figure 2-1: Muskrat Falls Generating Facility (Component 1)

2.2 SUB-COMPONENT 4B: HVAC OVERHEAD TRANSMISSION LINE MUSKRAT FALLS TO CHURCHILL FALLS

a) Transmission lines from Muskrat Falls to Churchill Falls:

   i) 2-315 kV ac, 3 phase lines, double bundle conductor;

   ii) Single circuit galvanized lattice steel guyed suspension and rigid angle towers; and

   iii) 250 km long.

2.3 CONSTRUCTION RELATED INFRASTRUCTURE

Construction related infrastructure will be established to support construction activity for components 1 and 4b. Some of this infrastructure is temporary and shall be decommissioned before the end of the construction phase. It is anticipated that the following infrastructure will be required:

a) A 1,500 person accommodations and administration complex (for construction period);

b) Access roads associated with the main dam structure, the accommodations complex and reservoir;

c) Diversion facilities (i.e. upstream and downstream coffer dams, the latter of which is to be removed prior to tailrace flooding);

d) Borrow pits and quarries;

e) Construction bridge;

f) Concrete and crushing plants;

g) Construction power and site communications infrastructure;

h) Reservoir clearing camps and wood storage yards;

i) Material storage and laydown areas including the potential use of port facilities (if upgrades are required to port facilities they shall be completed by the responsible party);

j) Fuelling and fuel storage facilities;

k) Spoil areas;

l) Muskrat Falls 25 kV construction power line & construction power terminal substation;

m) HVac transmission line construction camps; and

n) Trash and debris collection boom, associated roads and debris storage areas.

3 RELEVANT LEGISLATION

There are federal, provincial and municipal regulatory requirements that apply to the waste management needs of the Project. The Project will fully comply with all applicable regulatory requirements. Copies of all permits and licenses shall be obtained and kept on file and a copy provided to SLI by all Contractors, Subcontractors and facilities for all aspects of their work related to waste disposal. Compliance will be facilitated through a program of environmental compliance monitoring, primarily implemented by the On-Site Environmental Monitors.

3.1 FEDERAL

The following federal acts apply to waste management at the Project:

a) *Transportation of Dangerous Goods Act (TDGA);*

b) *Canadian Environmental Protection Act (CEPA); and*

c) *Hazardous Materials Information Review Act.*

3.2 PROVINCIAL

The following provincial acts and regulations apply to waste management at the Project:

a) *Waste Management Regulations;*

b) *Waste Diversion Regulations*

c) *Dangerous Goods Transportation Act;*

d) *Storage and Handling of Gasoline and Associated Products Regulations;*

e) *Used Oil Control Regulations;*

f) *Environmental Control Water and Sewage Regulations;*

g) *Newfoundland and Labrador Environmental Protection Act* (NLEPA); and

h) *Water Resources Act.*

3.3 MUNICIPAL

Should any construction activities take place within any municipal boundaries, local bylaws will need to be complied with and permits obtained.

Note: The above legislation listed in Sections 3.1, 3.2 and 3.3 is not considered exhaustive. The waste generator is responsible to ensure all relevant legislation is followed prior to waste generation and disposal on the LCP.

4 STAGED APPROACH TO WASTE MANAGEMENT

The following subsections describe waste management responsibilities before and after the start of the Garbage Removal and Disposal Contractor's (GRDC's) mandate, and Figure 4-1 shows the anticipated workforce during the approximate 6 year construction period.

4.1 PRE-GRDC IMPLEMENTATION

The Early Works contracts are the first to be awarded for the Project. The purpose of these contracts is to develop access and infrastructure to facilitate construction of the Muskrat Falls hydroelectric generating facility. These Early Works construction contracts are as follows:

- Main Site Access Road South Side (including clearing);
- Accommodations Complex Site Utilities
- Accommodations Complex Buildings;
- Administrative Buildings; and
- Construction Power.

During initial stages of Accommodations Complex development, a starter camp will be constructed. This camp will house the Bulk Excavation Contractor's workforce until the Accommodations Complex is fully developed.

After this starter camp is completed, the GRDC will begin its work, and provide service primarily to those housed at this camp.

It is anticipated that the total workforce on site will start at 125 to a maximum 490 people during the Early Works construction period.

4.2 POST-GRDC IMPLEMENTATION

Post-GRDC work includes all construction contracts that begin after the start of all Early Works contracts. During this time it is expected the site workforce will increase substantially from about 630 people initially and reaching 1,500 workers in the 4th year of construction.

As described above, the GRDC will remove and dispose of domestic wastes and sewage from holding tanks in facilities provided by SLI (e.g. wash-cars, trailers), sewage sludge from septic tanks for the starter camp, and sludge from the Accommodations Complex sewage treatment plant. All wastes generated in facilities established by Contractors (e.g. portable toilets, lunchroom/office trailers, etc) shall be the responsibility of the Contractor.

Excluded from the GRDC's mandate are construction & demolition wastes, all wastes generated by Contractors working in remote locations (e.g. Reservoir Clearing, ac Transmission Line), hazardous wastes other than sewage and sewage sludge as mentioned above and biomedical wastes.

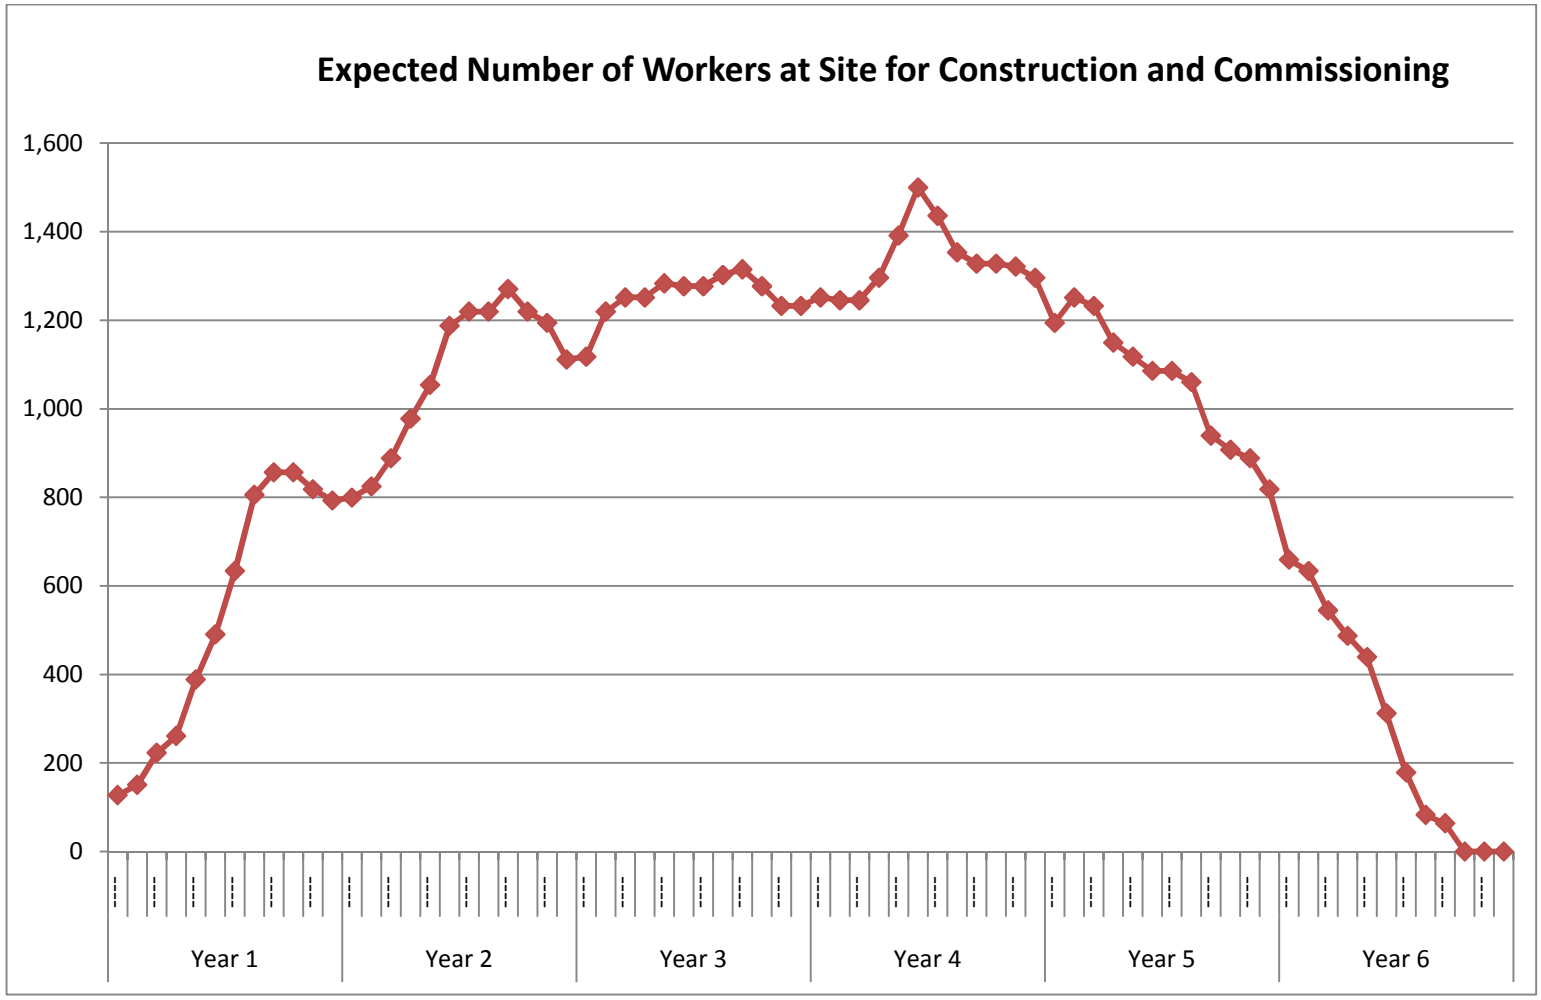

Figure 4-1: Expected Workforce from Year 1 to Year 6

5 ROLES AND RESPONSIBILTIES

The Lower Churchill Project environmental management team is comprised of NE-LCP and SLI environmental, engineering, and construction management staff. A Responsibility Matrix is provided in Figure 5-1. Figure 5-2 illustrates the team structure. Roles and responsibilities of team members are further defined in the sections that follow.

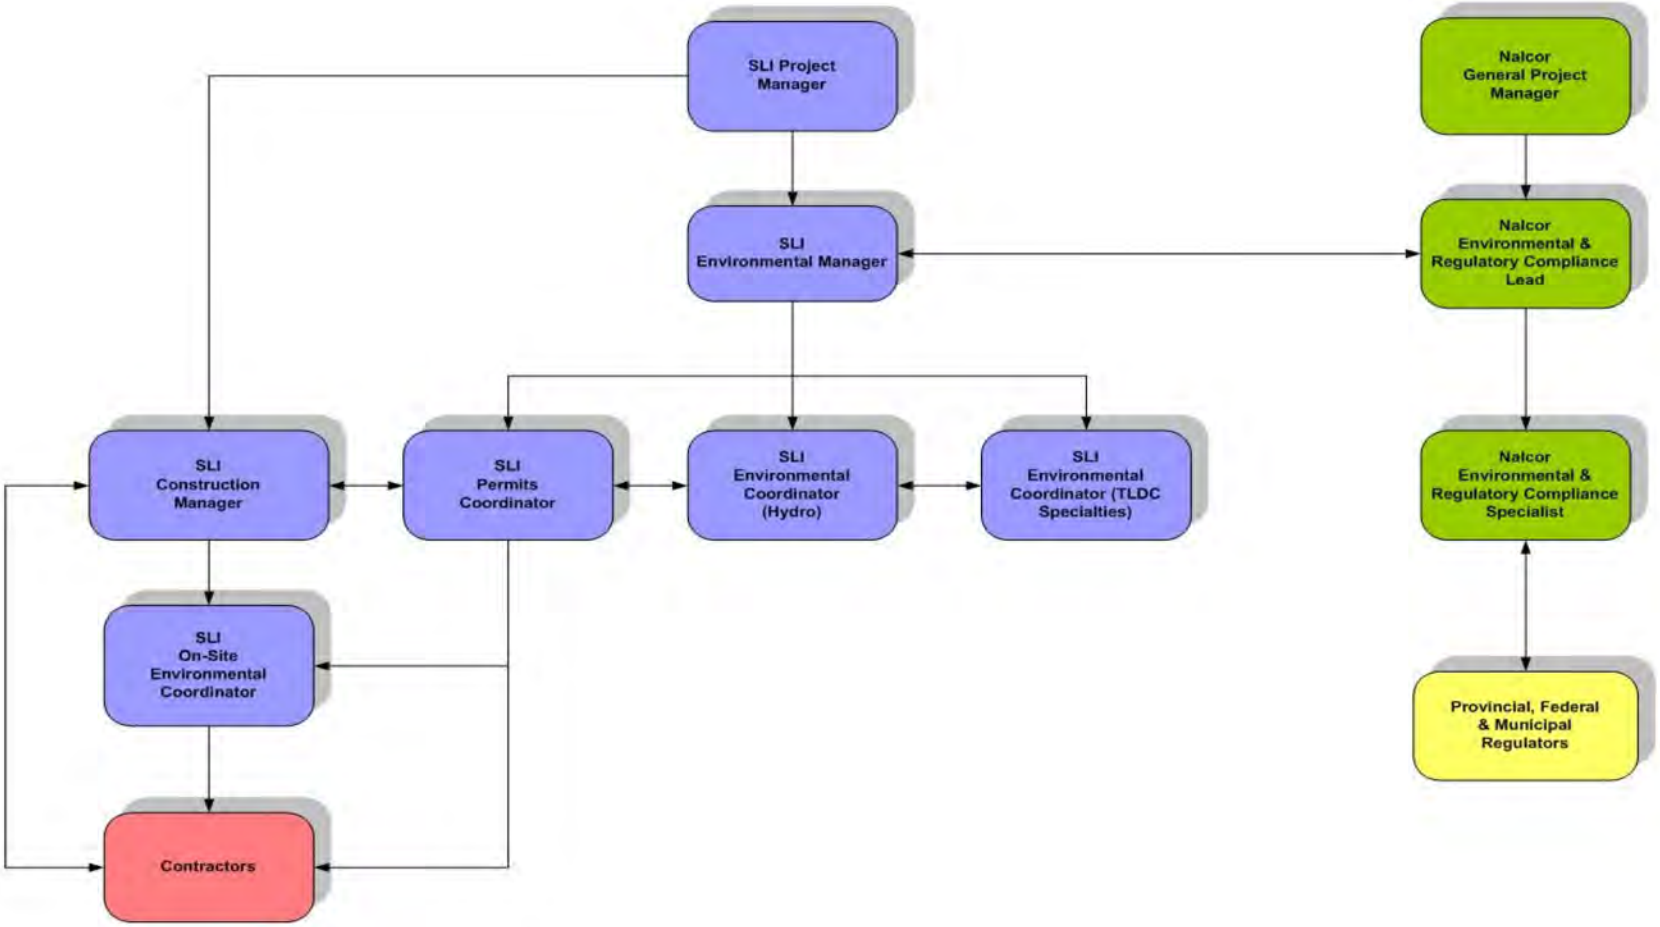

Figure 5-1: Lower Churchill Project Hydroelectric Generation Facility Project: Environmental Management Team

Activity	SNC-Lavalin Inc	Project Manager	Environmental Manager	Environmental Co-ordinator (Hydro)	Environmental Co-ordinator (TL/DC Specialties)	Permits Co-ordinator	Component Manager	Construction Managers	Interface Manager	Area Manager	On-Site Environmental Monitors	SLI Staff	Nalcor Energy	Garbage Removal and Disposal Contractor	Medical Services Contractor	Roads Contractor	Other Contractors

Accountable, **R**esponsible, **S**upports, **C**onsulted, **I**nformed

Figure 5-2: Responsibility Matrix

5.1 NALCOR

5.1.1 Individual Responsibilities

Nalcor's *Project Manager* shall be accountable for the review and acceptance of the *WMP*. As part of this process Nalcor shall be responsible for making sure that the plan as prepared is consistent with its environmental policy, and commitments made during the Environmental Assessment process to various aboriginal groups and stakeholders are honoured.

Nalcor's *Project Manager* shall be consulted on the various aspects of *WMP* management and will provide information to SLI's Environmental Management Team as required to manage and update the *WMP* and process applications for selected permits, as identified by Nalcor.

Nalcor's *Environmental and Regulatory Compliance Lead* and Nalcor's *Environmental and Regulatory Compliance Specialist* will support the *Project Manager* in his/her responsibilities. Communication and liaison with local municipalities and federal/provincial regulators will be the responsibility of the *Environmental and Regulatory Compliance Specialist.*

5.1.2 Nalcor Auditing Function

Nalcor will periodically perform audits on SLI's performance as it relates to the *WMP* to ensure compliance with commitments in the EIS and regulatory requirements.

5.2 SLI

Waste management support will fall under the guidance of the SLI Environmental Management Team (as shown in Figure 5-1). SLI shall provide onsite direction and monitoring of all waste management activities throughout the life of the Project. In addition, once the Garbage Removal and Disposal Contractor are engaged, SLI will:

- Provide a Hazardous Waste Storage Area for Contractor use; however construction and maintenance of storage facilities (i.e. used oil tanks) and final

disposal and removal of equipment will be the responsibility of the Contractor and he/she will abide by applicable regulations;

- Provide common collection locations for domestic waste and removal and disposal of this waste periodically through the GRDC[1];
- Provide services for the removal of sewage sludge through the GRDC[1];
- SLI/GRDC will not provide domestic waste collection services or sewage sludge removal services for Contractors operating during this phase in remote locations, nor for the road construction Contractor, reservoir clearing Contractor, ac Transmission Line Contractor, or for any construction camps used by them.

Administration type responsibilities are defined further in the following section of individual responsibilities.

5.2.1 Individual Responsibilities

SLI Project Manager

This individual shall be:

- Accountable for developing, implementing, managing and approving the *WMP;*
- Accountable for approving *WMP* revision requests;
- Accountable for all SLI staff actions including waste management compliance monitoring, tracking and potential corrective actions;
- Informed of Nalcor's review and acceptance of the *WMP*;
- Accountable for Contractor waste management actions and enforcing compliance related to the *WMP;* and
- Accountable for ensuring the Contractor receives the applicable site orientation related to waste management.

[1] Note the GRDC will remove and dispose of these wastes collected from only the hydroelectric generating facility site, Nalcor and Contractor laydown areas, and accommodations complex site.

SLI Environmental Manager

This individual shall be:

- responsible for all processes involved in developing, implementing and managing the *WMP*;
- Responsible for managing all *WMP* revision requests, including receiving such requests, coordinating the screening of these by appropriate members of SLI's and Nalcor's environmental management teams, and preparing/distributing waste management "Compliance Instructions" to key Project participants;
- Responsible for all SLI staff actions including waste management compliance monitoring and tracking, and enforcing corrective actions;
- Informed of Nalcor's review and acceptance of the *WMP*;
- Responsible for oversight of the Contractor's waste management activities such as storage and disposal;
- Responsible for distributing accepted *WMP* revisions to key Project participants, and receiving acknowledgement of receipt; and
- Responsible for ensuring that an annual performance review of the *WMP* is conducted.

SLI Environmental Coordinators (Hydro and Transmission)

This individuals shall be:

- Responsible for managing and implementing the *WMP* and waste management environmental compliance monitoring;
- Informed of Nalcor's review and acceptance of the *WMP* and the Contractor's orientation;
- Supportive to SLI's Environmental Manager in overseeing the Contractor's waste management activities;

- Responsible for maintaining a log of waste management "Compliance Instructions";
- Responsible to ensure all waste streams generated by the Contractors are identified in the Waste Management Plan; and
- Responsible for undertaking quarterly compliance audits for applicable components.

SLI Permits Coordinator:

This individual shall be:

- Responsible for managing the Permit Registry in conjunction with the *SLI Environmental Coordinator (Hydro)* and the *SLI Environmental Coordinator (Transmission);*
- Supportive to SLI's *Environmental Coordinators* with implementing and managing the *WMP* as well as waste management compliance monitoring;
- Informed of Nalcor's review and acceptance of the *WMP* and the Contractor's orientation;
- Consulted by the Contractors regarding disposal practices and requirements of permits; and
- Responsible for maintaining copies of permits/licenses, and track and communicate permit requirements for waste management.

SLI Component Managers:

These individuals shall be:

- Responsible for ensuring the *WMP* is included in procurement packages;
- Supportive for the development of the *WMP;*
- Consulted during waste management compliance monitoring; and
- Informed about all other aspects of the *WMP.*

SLI Construction Managers:

These individuals shall be:

- Responsible for overseeing construction including management of on-site waste management activities through implementation of the *WMP;*
- Responsible for reporting directly to SLI's *Project Manager* in St. John's;
- Consulted on all aspects of management of the *WMP*, waste management compliance monitoring, and compliance tracking;
- Responsible for ensuring Contractors receive the appropriate orientation and training required related to waste management; and
- Responsible for overseeing waste management activities by the Contractors at the Project Site, and reporting any non-compliance and enforce corrective actions.

SLI Area Managers:

These individuals shall be:

- Informed on all aspects of the *WMP;*

SLI On-Site Environmental Monitors:

These individuals shall be:

- Responsible for monitoring on-site Project activities;
- Responsible for evaluating the Contractors' environmental performance with respect to requirements established in the *WMP;*
- Responsible for tracking on-site compliance with regulatory requirements and conditions of all permits and approvals as they relate to waste management.
- Responsible for reporting directly to the OSEC, Construction Manager and SLI's Environmental Coordinators;
- Responsible for interacting with the Contractors on waste management matters;

- Responsible for preparing and submitting daily reports to SLI's Construction Managers, Environmental Manager, and Environmental Coordinators;
- Supportive to SLI's Construction Managers with ensuring Contractors receive the appropriate waste management orientation before working on site; and
- Responsible for ensuring that the Contractor's waste streams are all properly characterized.

SLI On-Site Environmental Coordinators:

These individuals shall be:

- Responsible for coordinating all activities and monitoring effort by the On-Site Environmental Monitors to ensure the WMP is complied with.
- Responsible for evaluating the Contractors' environmental performance with respect to requirements established in the *WMP;*
- Responsible for reporting directly to the Construction Manager and liaising with SLI's Environmental Coordinators;
- Responsible for interacting with the Contractors on waste management matters; and
- Supportive to SLI's Construction Managers with ensuring Contractors receive the appropriate waste management orientation before working on site.

5.2.2 SLI Auditing Function

The purpose of SLI's auditing function will be to evaluate the performance of the *WMP* and to identify opportunities for continual improvement.

SLI auditing will consist of daily field reports, quarterly environmental compliance audit reports, initiating corrective action and annual performance reviews.

Daily reports will be completed by the On-Site Environmental Monitor. These reports will focus on the Contractors' environmental performance, including a summary of their waste management activities.

A quarterly environmental compliance audit reports will be completed by SLI Environmental Coordinators for the Transmission and Hydro components. These reports will review all aspects of the Contractor's performance and will have a section focusing on incidents of non-compliance with the *WMP*. SLI's Environmental Coordinators shall distribute the Environmental Compliance Audit Reports to relevant Project participants.

An annual performance review will be completed by key members of the Environmental and Construction teams. This audit will review all aspects of the Contractor's performance, including activities that relate to waste management and disposal. The review process will give all parties a chance to evaluate overall environmental performance and compliance with government regulations, permits and all Plans, including the *WMP*.

5.3 CONTRACTORS

In all cases, Contractors must communicate clearly to SLI the types and volumes of waste they produce. In addition, they must regularly monitor their waste management activities to ensure that all required approvals are always in place and that facilities are appropriately licensed to accept their wastes.

5.3.1 Pre-GRDC Implementation

Contractors shall be responsible for the management of waste in their working areas in accordance with this *WMP*. Responsibilities include the safe collection and containment of all hazardous and non-hazardous waste. Contractors will also be responsible for the offsite transportation and final disposal of waste to a facility or site licensed to accept it. All waste will be the responsibility of the Contractor.

Biomedical waste will be the responsibility of the Medical Services Contractor. Contractors will support the Medical Services Contractor through approved temporary disposal of biomedical items.

5.3.2 Post-GRDC Implementation

The GRDC shall be responsible for collection of domestic waste and sewage removal at the camp facility post contract award. Contractors shall support the GRDC in the task of domestic waste disposal by management of domestic waste in their specific working areas in accordance with this *WMP*, including the transportation of waste to the provided containers or designated storage areas.

In certain cases in remote areas or areas that are difficult to access, Contractors (including the Roads Contractor, Reservoir Preparation Contractor and ac Transmission Line construction) will be responsible for managing their own domestic waste and sewage removal. Contractors will be responsible for the offsite transportation and final disposal of the domestic waste and also for engaging a licensed Sewage Removal Contractor.

All Contractors are responsible for their own construction and demolition material and all hazardous waste generated as a result of their activities. This material shall be transported to a facility or site licensed to accept it. A temporary storage area will be identified by SLI for temporary placement of hazardous materials, until such time that it can be transported to the appropriate facility or disposed of by a Hazardous Materials Sub-contractor (as engaged by the Contractor). This storage area is only a location to be provided by SLI, and the construction, maintenance and eventual removal of all hazardous material is the responsibility of the Contractor.

Biomedical waste will be the responsibility of the Medical Services Contractor. Contractors will support the Medical Services Contractor through approved temporary disposal of biomedical items.

6 MANAGEMENT PLAN

This *WMP* has been prepared, with considerations for current waste management practices in the province, for Component 1 and 4B of the Lower Churchill Project. That being said, waste management within the Province is changing, under the direction of the Provincial Waste Management Strategy. It can be expected that waste management requirements for the Project may need to be revised and revisited in the future as more local and regional modern waste management facilities and programs are established. Currently the Happy-Valley Goose Bay region contains a municipal landfill that accepts domestic waste along with a privately owned soil treatment facility licensed to accept hydrocarbon impacted soil. There is no licensed hazardous waste facility in the region. In addition, initiatives and programs for waste segregation are limited in the region at this time. As a result of the limited facilities and waste programs in the region, it is anticipated that most hazardous wastes will require transportation and disposal outside of the region or Province. In the event local waste initiatives and new waste facilities are established, the *WMP* will be revised to reflect these changes. Revisions to this plan shall be made as identified in the Preface.

This *WMP* addresses all wastes expected to be generated onsite during Component 1 and 4B work, classifies waste into streams and outlines the handling and disposal options for each type of waste. A summary of potential waste treatment and disposal options is included in Table 6-1.

All construction activities and their associated waste streams (outlined in the subsections below) are subject to appropriate regulations. Section 3 of this document provides a list of relevant legislation that applies to waste management on the LCP.

Contractors shall provide the Engineer with two (2) copies of all permit documentation and licenses immediately on receipt from regulatory agencies. Any subcontracted facility accepting any type of waste and recyclable materials shall provide documentation to the Contractor, and copies of this documentation shall be kept on file for inspection by the Engineer.

6.1 WASTE CLASSIFICATION

Contractors on site are responsible for the handling, sorting and in some cases storage and disposal of the waste they generate at the site (See Section 5, Roles and Responsibilities for Contractors responsibilities at different stages of the Project).

There are a number of strategies that Contractors can use to handle wastes expected at the site. These strategies are as follows:

- **Waste segregation:** All site Contractors, Subcontractors and the GRDC will be required to implement category-wise segregation of waste streams (i.e. liquid wastes, solid wastes, recyclable, hazardous, etc.) in accordance with local disposal requirements. All waste categories will be analyzed and the principals of the following three R's will be applied:
- **Reduction initiatives:** Reducing the raw material consumption is the first step to reduce waste generation. To practice this principle all processes and material used will be evaluated on the basis of possible reduction in raw material usage.
- **Recovery/reuse initiatives:** Recovery of usable material or energy as a by-product is an important part of the waste minimization process. All opportunities for onsite reuse of waste materials will be highly encouraged.
- **Recycling initiatives:** Recycling is the next option considered for the successful management of the waste streams. Wherever possible, recycling of used oil, beverage containers, tires, copper and aluminum, etc. and reuse of the material in other applications will be encouraged. A site orientation on recycling will be provided by SLI's Representative to all Contractors, Subcontractors and employees regarding recycling responsibilities.
- **Disposal:** Disposal becomes the final option when other options are not technically or economically feasible. All waste shall be disposed of according to relevant guidelines and regulations, as detailed in the following sections.

Hazardous vs. Non-Hazardous Wastes

The types of solid wastes considered include inert or non-hazardous wastes of various kinds (i.e. containers, filters, belts, scrap metals, domestic garbage, etc.) or hazardous wastes (i.e. used oils, solvents, paints, used/unused chemicals, old batteries, chemical based sludge etc.).

Both hazardous and non-hazardous wastes will be generated at the site. A general description of such wastes is illustrated in Figures 6-1 and Figure 6-2. A description of the prescribed handling and disposal methods of the anticipated materials generated at the site is provided in the following sections.

A Hazardous Waste Storage Area (HWSA) will be provided by the Project; however the Contractors will be responsible for construction and maintenance of any storage facilities (i.e. used oil tanks) that they place at the site. Contractors shall arrange for transportation to a licensed hazardous waste facility for possible recovery, treatment and disposal as required. All storage, handling and disposal activities will follow applicable regulations.

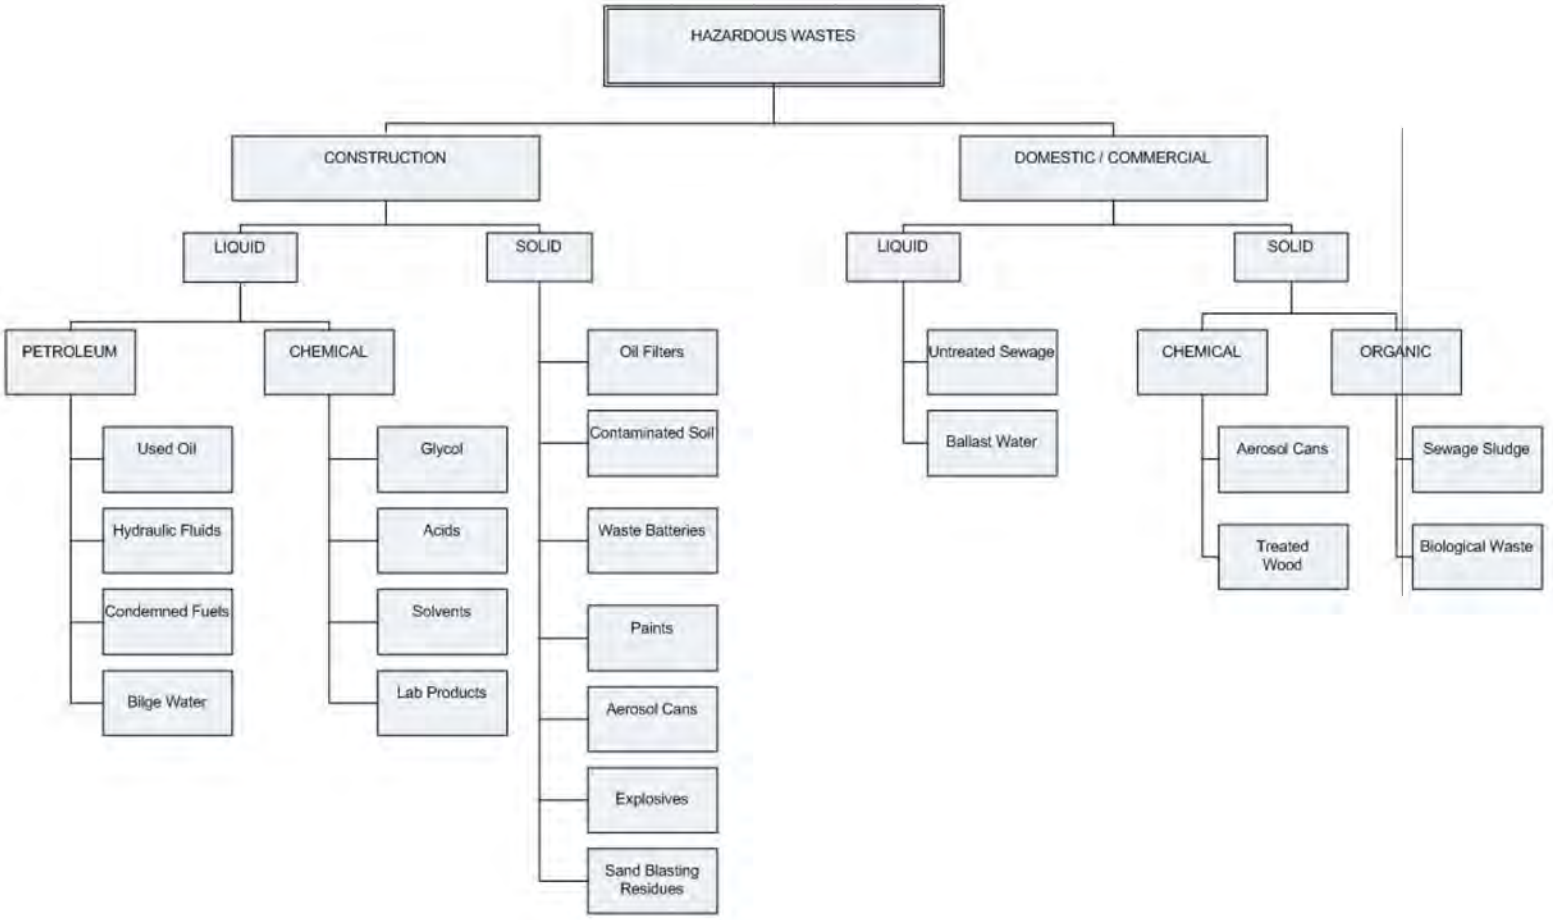

Figure 6-1: Potential Hazardous Waste Generate

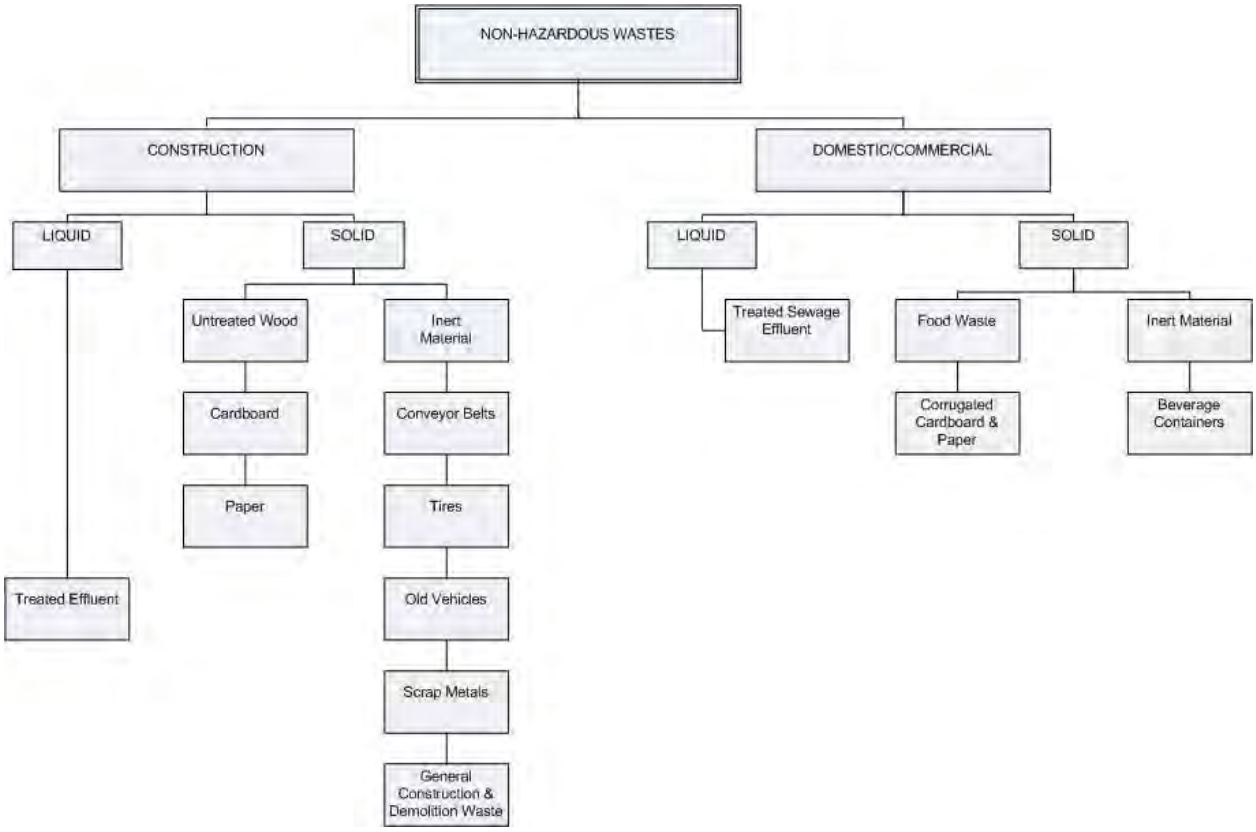

Figure 6-2: Potential Non-Hazardous Wastes Generated

6.2 HAZARDOUS WASTES

It is expected that hazardous wastes will be generated during construction activities. Hazardous wastes include such materials as used batteries, paint, cleaning fluids and petroleum based wastes.

Special precautions shall be exercised when handling these materials since the improper release or disposal could adversely affect the environment. Personnel handling wastes will be required to have specific training and utilize PPE to ensure safe handling and disposal.

A HWSA will be provided by the Project, however the Contractor will be responsible for construction and maintenance of any storage facilities (i.e. used oil tanks).

Contractors shall arrange for transportation to a licensed hazardous waste facility for possible recovery, treatment and disposal as required.

All chemical and hazardous wastes generated in remote areas will be managed under all applicable guidelines and regulatory requirements and brought to a licensed hazardous waste facility on a regular basis. Processing of the various anticipated chemical wastes are described below. Approved containers for hazardous wastes stored on site and transported to licensed disposal/recycling facilities shall meet requirements of the *Transportation of Dangerous Goods Regulations (see http://www.tc.gc.ca/eng/tdg/moc-menu-202.htm).*

Note: Contractors are responsible for disposal of their Hazardous waste including preparation, suitable shipping containers and transportation of the hazardous waste to an offsite licensed disposal facility. Regular checks will be made by the On-Site Environmental Monitors.

6.2.1 Hazardous Construction Wastes

6.2.1.1 Hazardous Construction Liquid Petroleum Wastes

Petroleum-based wastes generated at the site will primarily be used engine and hydraulic oil. In addition there may be rear end/differential gear lubricants, oil from site electricity generators, used degreasing solvents, contaminated or expired diesel. These wastes shall be segregated as necessary in order to render the individual waste streams easier to reuse for other purposes, recycle or permit recovery of by-products.

Used Oil and Hydraulic Fluids

The Contractor is encouraged to initiate acceptable recycling options for used oil, either onsite or offsite, wherever practical. For example, used oil could be reused or combined (with new oil) where low-grade fuels may be used such as kerosene heaters, waste oil burners for shops and warehouses (with DOEC approval) or it could be sent offsite for recycling.

The Contractor shall deposit used oil in a secondary containment tank located at the HWSA. The Contractor is responsible for installing and maintaining these tanks. The waste oil shall be regularly collected by a qualified and experienced Hazardous Waste Contractor. The Hazardous Waste Contractor shall be engaged by the Contractor.

The tanks will have double-containment and roof-vent connection for oil removal as defined in the *Used Oil Regulations*. All connecting pipes will be above ground, making it easier to inspect for leaks. The tank fill ports will normally be locked and the keys made accessible to designated employees only as per the *Provincial Used Oil Control Regulations*.

Note: Waste oil may be contaminated with small amounts of diesel fuel, heating fuel and water, while still retaining its recycling properties. Contamination with gasoline, glycol, solvents, or solids will render waste oil unfit for recycling into usable engine oil at any offsite facility and create a large increase in disposal unit costs.

Regular monitoring will be carried out as per “Design, Construction, Operation, Maintenance and Inspection of Terminal and Tank Facilities Guidelines”, API-2610 and any additional provincial registration requirements and *Provincial Used Oil Control Regulations* under the *Environmental Protection Act*. The Contractor shall provide the Engineer with two (2) copies of all permit documentation immediately on receipt from regulatory agencies. This includes the permit from the disposal facility permitted to accept the used oil.

The Contractor is required to maintain an active inventory of all petroleum products on site. This will ensure that reasonable balance is maintained between the amount of oil used/recovered versus amounts unused and in inventory.

Condemned Fuels

Diesel fuel is sometimes condemned when the water content is too high. These fuels can be stored in drums at the HWSA by the Contractor and transported offsite to be used by others as low-grade fuels through a waste exchange program or sent to a licensed offsite facility for destruction.

Bilge Water

The word is typically used to describe the water that collects in the bilge compartment of a marine vessel. Water that does not drain off the side of the deck drains down through the ship into the bilge. This water may be from rough seas, rain, minor leaks in the hull, other interior spillage, etc. The water that collects in the bilge must be pumped out to prevent the bilge from becoming too full and threatening to sink the ship.

Bilge water can be found aboard almost every vessel. Depending on the ship's design and function, bilge water may contain water, oil, urine, detergents, solvents, chemicals, pitch, particles, and so forth.

By housing water in a compartment, the bilge keeps these liquids below decks, making it safer for the crew to operate the vessel and for people to move around in strong weather.

Under no circumstances shall bilge water be discharged into the ocean. This water shall be collected by an approved waste management firm, and treated and/or disposed of at an approved hazardous waste facility.

6.2.1.2 Hazardous Construction Liquid Chemical Wastes

Solvents

During construction, solvents will be used as a degreasing agent in the maintenance shops, Generator enclosures and utility services buildings. These degreasing solvents are toxic petroleum based chemicals; however, non-toxic citrus-based alternatives shall be encouraged as substitutes where only moderate degreasing or

cleaning is required. Detergents and steam jets shall be used where feasible to minimize the use of solvents. Solvents shall not be allowed to drain onto the ground; they shall be collected in drip pans for reuse or disposal.

Residual or used solvents shall be stored in leak-proof containers. The containers will be shipped offsite to a licensed recycling/disposal facility. Industrial part washers/solvent recyclers are available and Contractors are encouraged to use them to reduce the amount of waste solvent generated.

Lab Products

During construction, materials testing may be established on site. These sites will predominantly perform physical tests; chemical waste generation will be minimal. The personnel working in these facilities will be trained to identify and segregate the hazardous components from their waste streams. The chemical wastes shall be stored in containers (as outlined in Material Safety Data Sheets (MSDSs) required by Workplace Hazardous Materials Information System regulations and other relevant legislation, as shown in Table 6-1) and shall be collected by a qualified and experienced Hazardous Waste Contractor.

6.2.1.3 Hazardous Construction Solid Wastes

Used Filters

Used oil filters will be generated with ongoing heavy equipment maintenance. Used filters drained of oil will be stored in separate lined drums established at the HWSA by the Contractor for pickup by a qualified and experienced Hazardous Waste Contractor. A final record of disposal from the licensed hazardous waste facility should be provided by the Contractor to the Engineer.

Contaminated Soil

Effective implementation of this *WMP* should lead to a reduction of soil contamination via on-going inspection and scheduled maintenance of equipment, use of trays for draining, lining of loading and unloading zones and using secondary

containment, for example secondary containment of hazardous materials storage tank areas. In spite of these measures, spills, leaks and ruptures may occur and hydrocarbon contamination of soil is a possibility. All spills and leaks shall be reported to the On-Site Environmental Monitors and immediate corrective action shall be taken. Refer to the Master Spill Response Plan and the P-WEPP for contingency and response plans in the case of a petroleum spill. Contaminated soil shall be transported to a licensed Soil Treatment Facility.

Note: Contaminated soil should be substantially reduced through education programs, equipment maintenance, operational techniques and manual "pick and shovel" excavation of land based spills wherever possible. The On-Site Environmental Monitors will be provided with a progressive and final record of disposal from the offsite licensed soil treatment facility.

Waste Batteries

It is expected that the bulk of used batteries generated will be primarily the lead acid type.

Used batteries shall be stored at the designated HWSA. The Contractor shall be responsible for storage/disposal/recycling of used lead/acid batteries, including draining and provision of shipping pallets, and transportation of the waste batteries to an off-site licensed disposal or recycling facility. The following procedures should be used for lead acid type batteries, such as those used by vehicles and industrial equipment:

- protect battery terminals with electrical tape to prevent short circuits;
- wrap battery with cloth, tape, and place in a polyethylene (garbage) bag;
- place in sturdy cardboard box, again packed with tape;
- place packaged batteries on a pallet, ensure all batteries are covered, and wrapped in shipping wrap or strapped. Do not ship batteries in a drum.
- Batteries must be shipped in accordance with the TDG Regulations.

Paints

Waste paint will be recycled or reused if possible. Water-based paint will replace oil-based paint, alkyd, or epoxy wherever technically and economically feasible. Waste paint will be stored in drums at the designated HWSA and shipped to a licensed recycle/disposal facility. Paint cans that do not contain residual paint can be placed with general waste for disposal at a landfill approved to accept such waste. Paint and paint cans generated by Contractors, will be their sole responsibility, along with handling, shipping and disposal as applicable.

Aerosol Cans

The use of aerosol cans on site will be discouraged, however; where unavoidable, aerosol cans with residual product shall be collected separately in marked containers at the various work areas. Contractors, employees and other site personnel will be advised to separate these cans from the general waste stream. The cans shall be transported off site by a certified Hazardous Waste Contractor. Aerosol cans that do not contain residual product can be placed with general waste for disposal at a landfill approved to accept such waste.

It is recommended that the Contractor follow the waste minimization policy, as aerosols should be substituted wherever possible with refillable type pump/spray bottles.

Explosives

The Contractor will deal solely and expediently with any contaminated or expired explosive material in accordance with all licensing and regulatory requirements, standards and best practices. If any explosives are to be destroyed or shipped off-site, the Contractor will acquire approval from the On-site Environmental Monitors prior to taking action.

Explosives packaging may be burned at a site designated to do so. The Contractor shall get approval from the On-Site Environmental Monitor prior to taking action.

Sandblasting Residues

During construction, sandblasting operations will be carried out in order to prepare some metal surfaces for coatings. During sandblasting activities, the surrounding areas shall be shrouded for dust control and all residual materials resulting from the sandblasting shall be collected by Contractor and temporarily stored in drums for analytical testing consistent with DOEC's Pollution Prevention Division's guidance document entitled *Leachable Toxic Waste, Testing and Disposal*. The sandblasting residues, if determined through analysis as hazardous, shall be shipped offsite in accordance with all regulatory requirements, including those of the *Transportation of Dangerous Goods Regulations,* for final disposal at a facility licensed to accept hazardous materials. As previously discussed, hazardous material shall be temporarily stored in the Project provided storage location (HWSA). If the sandblasting residue is deemed non-hazardous, it will be transferred to a landfill approved to accept such waste.

6.2.2 Hazardous Domestic/Commercial Wastes

6.2.2.1 Hazardous Domestic/Commercial Liquid Wastes

Untreated Sewage

Toilet and wash facilities will be located throughout the site. For early works packages, port-a-potties or holding tanks will likely be used. Subsequent to the Early Works program septic systems with tile fields will be utilized for the starter camp, a full water and sewer/sewage treatment plant will thereafter be used for Accommodations Complex, sewage holding tanks and portable toilets will be used at remote locations. See Section 5, Roles and Responsibilities for information on sewage waste throughout the life of the Project.

In the case of toilet facilities not connected to any form of treatment, human waste shall be collected using a licensed septic removal service and sent to a licensed disposal facility. This will be required in cases where the responsibility does not rest with the GRDC (e.g. construction camps and work sites used by the Reservoir

Clearing and ac Transmission Line Contractors, or any of the Early Works Contractors). The Contractor shall provide the Engineer with two (2) copies of all permit documentation and licenses for this service immediately on receipt from regulatory agencies. These services are available within the Town of Happy Valley-Goose Bay.

Ballast Water

The Ballast Water Control and Management Regulations, under the *Canada Shipping Act,* identifies the procedures to be used for release of Ballast Waters in Canadian Waters. Provisions of these regulations shall be strictly followed by all vessels involved in transporting goods, equipment, and materials involved on the Project.

6.2.2.2 Hazardous Domestic/Commercial Solid Wastes

Organic - Biomedical Waste

Small amounts of biomedical wastes will most likely be generated during construction. For the purpose of this Waste Management Plan, biomedical wastes regarded as hazardous include:

- All waste sharps (e.g. waste needles), wherever they are generated;
- All waste material generated in on-site medical clinics and mobile treatment centres that have become contaminated with bodily fluids;
- All wastes deposited in receptacles that are labelled “Biomedical Wastes Only” and which are strategically located within Company provided facilities; and
- All similar wastes collected and stored by Contractors in their own facilities.

Note that all soft waste materials contaminated with “significant amounts” of bodily fluids shall be immediately double bagged in plastic. These shall be placed in a “Biomedical Waste Only” receptacle provided by the Company or Contractor. All other materials and surfaces that have come in contact with such fluids shall be immediately cleaned with a disinfectant, such as bleach.

Persons using needles to administer their own medication (e.g., diabetics) shall place their used needles in the approved sharps containers provided throughout the site.

Sharps generated in remote locations shall be collected and stored in approved sharps containers.

Biomedical wastes collected from filled sharps containers and “Biomedical Waste Only” receptacles shall be removed from the work site and transported to a licensed facility for destruction and disposal.

Disposal of biomedical waste collected at Company supplied facilities is the responsibility of the Medical Services Contractor. There is an existing bio-medical waste collection service that collects waste from Happy Valley - Goose Bay. The Medical Services Contractor shall organize a pickup/drop off schedule with for this service.

Off-site removal and disposal of biomedical wastes collected by Contractors and stored at their facilities shall be the Contractor’s responsibility.

Organic - Sewage Sludge

Sewage sludge generated by sewage treatment systems shall be removed from site by the GRDC and disposed of at a licensed waste disposal site.

Chemical - Treated Wood

During construction, pieces of unusable lumber treated with wood preservation chemicals shall be collected and disposed of in a licensed waste disposal site.

Chemical - Aerosol Cans

Aerosol cans shall be collected and disposed of in a licensed waste disposal site.

6.3 NON-HAZARDOUS WASTES

The handling, storage and disposal of waste materials that are classed as Non-Hazardous and generated at the site is generally the sole responsibility of the

Contractor and shall be managed under all applicable guidelines and regulatory requirements.

An exception to this would be food wastes generated at the permanent Accommodations Complex. These wastes will be collected, hauled, and disposed of by the GRDC in accordance with a services contract.

6.3.1 Non-Hazardous Construction Wastes

6.3.1.1 Non-Hazardous Construction Liquid Wastes

Treated Effluent

Treated effluent (including effluent discharging into a water body from settling ponds, sewage treatment plants, and concrete batch plants) shall be released to the environment in accordance with SLI's approval.

Prerequisites for this approval are that all applicable regulatory permits and approvals be provided to SLI, and that the effluent quality is shown to meet all regulatory requirements (e.g. *Environmental Control (Water and Sewer) Regulations* and Section 36(3) of the *Fisheries Act)*, and permit conditions.

All concrete trucks and associated equipment shall be cleaned in a manner that conveys all wash water to an approved settling pond to ensure its treatment prior to release to the environment. Washing of this equipment should preferentially take place at the concrete batch plant; however, minor washing of concrete truck chutes and hand tools may take place at the delivery location, provided that all wash water is contained and directed to an approved settling pond for treatment.

6.3.1.2 Non-Hazardous Construction Solid Wastes

The discussion below focuses on solid non-hazardous waste destined to approved waste disposal sites. Written copies of the site operators' permission shall be provided to the Engineer prior to disposal.

Inert Material

SLI is committed to reducing the volume of the overall waste to the greatest extent practicable by reusing and recycling. Inert waste, such as waste concrete from the cleaning of cement trucks and pumps, off-spec and/or surplus production shall be reused rather than dumped whenever practicable.

If required, disposal of small amounts of waste concrete shall be done at a designated disposal site, which shall be accepted by the On-Site Environmental Monitors. The concrete shall be discharged into one or more "cow patties" not more than 6 feet in diameter and allowed to cure completely before being incorporated into the site fill.

Where possible, off spec or waste concrete shall be utilized to manufacture items such as barriers, retaining structures, etc; disposal shall be considered a last resort. If disposal is required, construction and demolition (C&D) waste shall be taken to a landfill approved to accept such waste.

Conveyor Belts and Tires

Conveyor belts and tires have limited life and, when no longer usable, contribute to construction waste generation.

Contractors must pursue a tire and conveyor belt exchange program with the vendors; and an investigation of alternative uses for old conveyor belts and tires shall be ongoing. Some suitable alternate uses for tires are dock protection and road protection in turning areas. However, for the most part, used conveyor belts and those tires not included under the MMSB tire recycling program (i.e. heavy equipment and industrial tires, etc.) shall be removed from the site and transported to a licensed waste disposal area. Tires included under the MMSB program, shall be taken to a MMSB authorized collection point by the Contractor for disposal.

Old Vehicles

Vehicles and equipment shall be shipped offsite for reuse/recycle when they are no longer useable. While awaiting back shipping, each Contractor shall store unusable

vehicles and/or their metallic parts in areas designated by the Engineer. These shall be collected and hauled to a licensed metals recycling facility for processing.

All fluids shall be drained/collected and stored in a manner acceptable to SLI (in Project provided storage location previously mentioned) where they shall be collected and/or transported to a licensed Hazardous Waste Facility.

Scrap Metals

This waste stream consists of ferrous and nonferrous scrap metals of various types. Metal scraps may be generated from cut-off parts of reinforced steel bar, wire, ends of piping and other similar items. Scraps shall be deposited in a metals storage bin and collected by a licensed metals recycler.

Bulky scrap metals such as unusable vehicles or large appliances shall be shipped offsite for salvaging and disposal. Reusable scrap metals such as sheeting and used drums will be reused as a part of an effective waste reduction program. Recoverable/recyclable scrap metals shall be sent to the recycling facilities directly by the Contractor. Scrap metals that cannot be recycled will be sent to a landfill approved to accept such waste.

General Construction and Demolition Waste

Waste generated during construction activities may include salvageable materials such as electrical cables and reels, cladding, piping and insulation, where possible, these shall be removed from site for potential reuse. Alternatively, any useable excess materials, which might be required for maintenance and/or repairs, will be stored neatly in a warehouse or designated laydown area. Innovative use of excess materials, such as using electrical reels for stacking supports or portable bollards, will be encouraged where practical. Materials that cannot be recycled or reused will be transported directly to a landfill approved to accept such waste.

Untreated Wood

During the construction phase, pieces of broken untreated lumber shall be collected and disposed of in a landfill authorized to accept such waste. .

Larger pieces of untreated lumber shall be stored at an SLI approved temporary storage area for potential reuse. Site personnel shall be informed to reuse this lumber material as much as possible or wherever feasible. When no longer usable at the site, untreated wood waste shall be shipped offsite for reuse.

Cardboard and Paper

Cardboard and paper wastes shall be recycled collected and sent to a local recycling facility, if available, or disposed of at an approved waste disposal site.

6.3.2 Non-Hazardous Domestic/Commercial Wastes

6.3.2.1 Non-Hazardous Domestic/Commercial Liquid Wastes

Effluent from a sewage treatment system that meets all regulatory requirements and permit conditions for discharge to the environment shall be released in accordance with the Engineers approval.

6.3.2.2 Non-Hazardous Domestic/Commercial Solid Wastes

Inert Material

The solid domestic waste stream consists of food waste, recyclable containers (cans, bottles), inert non-combustible domestic waste, packaging, corrugated cardboard, plastics, and paper and paper products.

The disposal of solid domestic waste is the sole responsibility of the Contractor for all Early Works contracts. For all other contracts, a GRDC is expected to be in place and this waste disposal Contractor shall assume responsibility for this waste stream.

All solid wastes generated in remote locations (including the Roads Contractor) will be managed by individual Contractors and transported to a licensed waste disposal site on a regular basis.

Food Waste

The majority of the food wastes will be generated in the lunchroom areas of the construction site and accommodations complex. All food waste shall be collected and disposed of in an enclosed and covered wildlife-proof bin to minimize the attraction of wildlife.

Bag lunch wastes generated in various work areas shall be collected in plastic bags and taken directly to wildlife-proof bins. This will then be placed in a storage bin and taken to a landfill for disposal or compost. Appendix A includes a supplier's brochure of bear resistant containers that are acceptable for use as wildlife-proof bins.

Where possible, purchasing bulk food packages shall be encouraged at the site to minimize waste production, through the reduction of packaging materials.

Beverage Containers

Although plastic waste will be included in the garbage stream, bulk purchases and, where possible, reusable containers should be utilized to reduce the overall generation of plastic waste.

Where reuse of beverage containers at the site is not possible, and where practical, arrangements shall be made to transport those beverage containers to a local recycling depot.

Corrugated Cardboard and Paper

Fibre waste will be included in the garbage stream; however, where possible, paper reduction strategies should be exercised to reduce the overall generation of fibre waste. Examples of reduction strategies may include workplace initiatives promoting double-sided printing, employee training, procurement policies with respect to packaging, etc.

All cardboard and paper shall stored in a bin and be shipped off site to a licensed recycling facility, when required.

Reduction in cardboard waste will be achieved by encouraging Contractors and suppliers to avoid extensive packaging.

6.4 OTHER WASTES

6.4.1 International Waste

Due to the possibility of shipment of supplies by water at the Happy Valley - Goose Bay and Cartwright Ports, international waste may be off-loaded from an international source, upon inspection and approval of the Canadian Border Services Agency (CBSA). The On-Site Environmental Monitors will be responsible to contact CBSA prior to off loading, however under a contractual arrangement, responsibility will rest with the Contractor and all associated documentation and records will be made available to the On-Site Environmental Monitors upon request.

Table 6-1: Treatment and Disposal Plan

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
Petroleum Waste Stream				
Used Oil including used Hydraulic Fluids	Collect in trays and drums. Transfer to ULC storage tanks. Ship offsite.	Ship Offsite to a Licensed Facility for recycling or destruction	*Used Oil Control Regulations, EPA* *GAP Regulations, EPA* *TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations* *Fire Prevention Flammable and Combustible Liquids Regulations under the Fire Prevention Act, 1991*	Contractor
Condemned Fuels	Collect and store in drums at the Hazardous Waste Storage Area (HWSA). Ship offsite.	Ship Offsite to a Licensed Facility for recycling or destruction	*GAP Regulations, EPA* *TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations* *Fire Prevention Flammable and Combustible Liquids Regulations under the Fire Prevention Act, 1991*	
Used Oil Filters	Store canisters in separate drums at the HWSA. Ship offsite.	Recovery/Landfill at Licensed Offsite Facility	*Used Oil Control Regulations, EPA* *TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations*	
Contaminated Soils	Analyse Samples. Consult Regulations. Ship offsite.	Ship to Licensed Offsite Facility for Destruction or Bioremediation	*NL Guidance Document for the Management of Impacted Sites*	

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
Chemicals				
Acids	Store in approved containers at the designated HWSA. Ship to offsite disposal facility.	Reduce / Dispose offsite.	*TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations*	Contractor
Solvents	Use non-toxic solvents when feasible. Store in approved containers at the designated HWSA. Ship to disposal facility offsite.	Reduce / Dispose offsite.	*TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations* *Fire Prevention Flammable and Combustible Liquids Regulations under the Fire Prevention Act*	
Waste Batteries	Store at the designated HWSA. Ship offsite by a qualified and experienced Hazardous Waste Contractor as per TDG requirements.	Ship to Licensed Offsite Facility for recycling or disposal.	*TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations*	Contractor
Aerosol Cans	Collect cans separately in marked drums. Store at the HWSA. Ship offsite by a qualified and experienced Hazardous Waste Contractor.	Reduce / Ship contents to Licensed Offsite Facility Offsite for disposal.	*TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations*	
Solvents, Paints, epoxies and adhesives.	Collect cans with residual product in drums. Store at the designated HWSA. Ship offsite. Empty containers can be collected	Dispose offsite at an offsite Licensed facility.	*Fire Prevention Flammable and Combustible Liquids Regulations under the Fire Prevention Act, 1991*	

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
	and shipped with regular waste for disposal in Regional Landfill.			
Laboratory Products	Store at source. Dispose offsite.	Dispose offsite at an offsite Licensed facility.	*TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations*	
Explosives (expired or contaminated)	In accordance with all regulatory standards, protocols, good practices.	Reduce, destroy, ship off-site	*TDG Regulations*	Contractor
Other Wastes				
Fluorescent bulbs/tubes	Store at the designated HWSA. Ship offsite by a qualified and experienced Hazardous Waste Contractor.	Recovery/Landfill at Licensed Offsite Facility	*TDG Regulations* *Reference Material for the WHMIS Requirements of the Hazardous Products Act and Controlled Products Regulations*	Contractor
Tyvek Suits/Rags	Store at the designated HWSA. Ship offsite by a qualified and experienced Hazardous Waste Contractor.	Recovery/Landfill at Licensed Offsite Facility		
Printer and Toner Cartridges	Store and send back to supplier or manufacturer.	Recycle	*Discuss with equipment supplier.*	
Domestic Wastes				
Food	Collect in plastic bags.	Landfill/Compost		

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
	Take directly to storage bin. Do not store outside.	at Regional Waste Management Facility or approved landfill site.	*Waste Diversion Regulations, EPA* *Provincial Waste Management Strategy* *Waste Management Regulations, EPA*	Contractor during early works. GRDC upon implementation of contract (exception: road Contractor, reservoir clearing, ac transmission line Contractors).
Paper and Cardboard	Contractors store dry materials for collection. Place in storage bin and ship offsite to a licensed recycling facility or Regional Waste Management Facility, when required.	Landfill when applicable/ Recycle		
Plastics	Plastics of non-toxic materials to be included with regular waste and transported to landfill.	Recycle/Landfill	*Waste Diversion Regulations, EPA* *Waste Management Regulations, EPA*	
Beverage Containers	Collect beverage containers accepted under the MMSB Beverage Container Recycling Program and make available to charitable organizations.	Recycle	*Waste Diversion Regulations, EPA* *Waste Management Regulations, EPA* *Multi-Materials Stewardship Board (MMSB) – Beverage Container Recycling Program and School Program*	
Tin Cans	Contractors store dry materials for collection by GRDC. Collect and store with recyclable plastics and	Recycle	*Waste Diversion Regulations, EPA* *Waste Management Regulations, EPA*	

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
	ship offsite to Regional Waste Management Facility.			
General Wastes	Collect and store in compactor bin. Ship offsite to a licensed facility.	Landfill		
Inert Bulk Wastes				
Passenger and light truck tires	Remove from site and transport to a licensed tire storage/disposal area. Work within the MMSB's Used Tire Recycling Program	Re-use / Recycle / Dispose offsite	*Waste Management Regulations, EPA* *MMSB – Used Tire Recycling Program*	Contractor
Vehicles	Drain and collect residual fluids and store in laydown area. Ship offsite via licensed metals recycler.	Recycle	*Waste Diversion Regulations, EPA* *Waste Management Regulations, EPA*	
Bulk Construction Debris	Stockpile in designated laydown area. Reuse/Recycle where possible. Ship offsite to Regional Landfill Site.	Reuse / Recycle / Dispose offsite	*Waste Diversion Regulations, EPA*	
Scrap Steel / Wire / Aluminum	Store recyclable wire or aluminum in metal bins at storage area. Store bulk steel at laydown area and ship offsite.	Recycle offsite	*Waste Management Regulations, EPA*	

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
Sandblast Residue	Collect at source. Store in drums at the storage area. Ship offsite or transfer to landfill.	Landfill		
Concrete	Disposal of "cow patties" at designated site. Once cured can be used in site fill material	Reuse as fill		
Special Wastes				
International Waste	Contact Canadian Border Services Agency for inspection and approval prior to off loading.	Landfill	*Health of Animals Act , Section 17* *Health of Animals Regulations, Section 47 and 105 (3)* *Plant Protection Act* *Plan Protection Regulations*	Contractor
Biomedical Wastes	Store in special waste receptacles Ship offsite.	Dispose offsite		
Asbestos Waste	Requires removal at source by a licensed Asbestos Abatement Contractor.	Landfill	*Environment Protection Act* *Asbestos Abatement Regulations, 1998* *The Occupational Health and Safety Act* *Highway Traffic Act*	
Human Waste	Collected at source and removed by a licensed Septic Removal Contractor.	Treatment and Disposal	*Public Health Act, Sanitation Regulations*	Contractor during early works. GRDC upon implementation of contract (exception: road

Waste Type	Site Handling/Shipping Methodology	Treatment or Disposal Strategy	Applicable Regulations/Permits/Information	Primary Responsibility
				Contractor, reservoir clearing, ac transmission line Contractors).

7 ESTIMATED VOLUMES OF SPECIFIC WASTE STREAMS

Potential waste streams were identified in previous sections however the primary waste streams identified at the planning stage that are expected to be generated at the Project site include domestic, sewage and construction waste. As such, waste volumes for these three waste streams have been calculated for early works and work following the start of the GRDC's mandate. In addition, two other significant wastes that have been identified include used oil and explosive boxes. The volumes of all items are calculated and shown in the sections below.

7.1 EARLY WORKS

7.1.1 Domestic Waste (Early Works)

The estimated amount of domestic waste to be generated during the first 6 months is approximately 50 tonnes. A generation rate of 1 kg/person/day was utilized to calculate this number as domestic waste directly corresponds to population or in this case the number of workers located on site.

The estimated tonnage is expected to fill approximately five, 37 yd^3 compactor trucks, based on 10 tonnes per load. Figure 7-1 provides the breakdown of domestic waste volume per month.

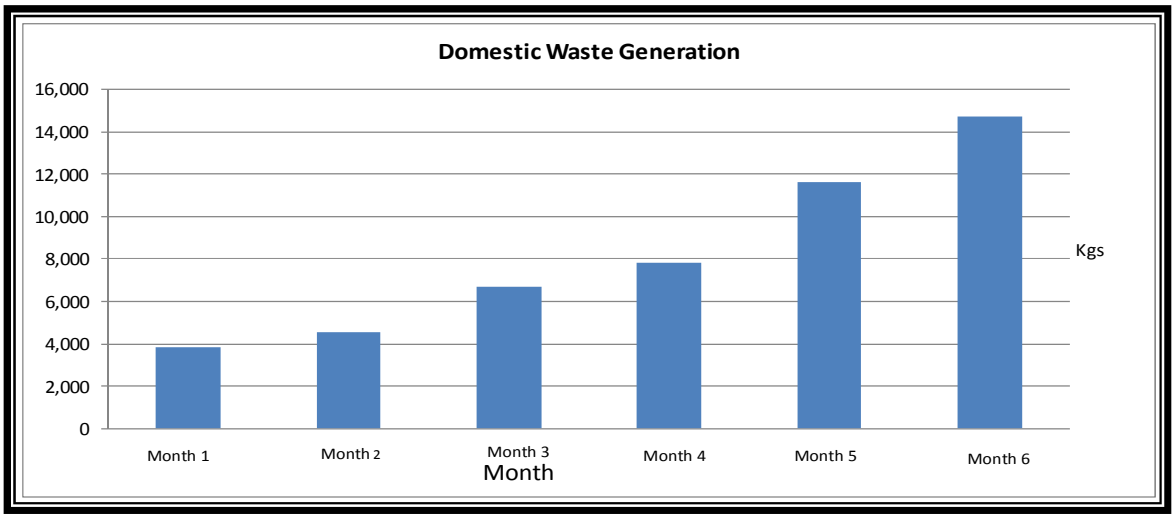

Figure 7-1: Domestic Waste Generation (pre-GDRC implementation)

7.1.2 Sewage Waste (Pre-GDRC Implementation)

During the majority of the early works, more notably during the construction of the access road, the site will be serviced with portable toilets. Based on an estimated sewage generation rate of 10 L/person/day, the total estimated amount of sewage waste to be generated prior to the start of GDRC's mandate is about 500,000 L. Figure 7-2 provides the breakdown of sewage waste volume per month. More information about sewage disposal is located in Section 6.2.

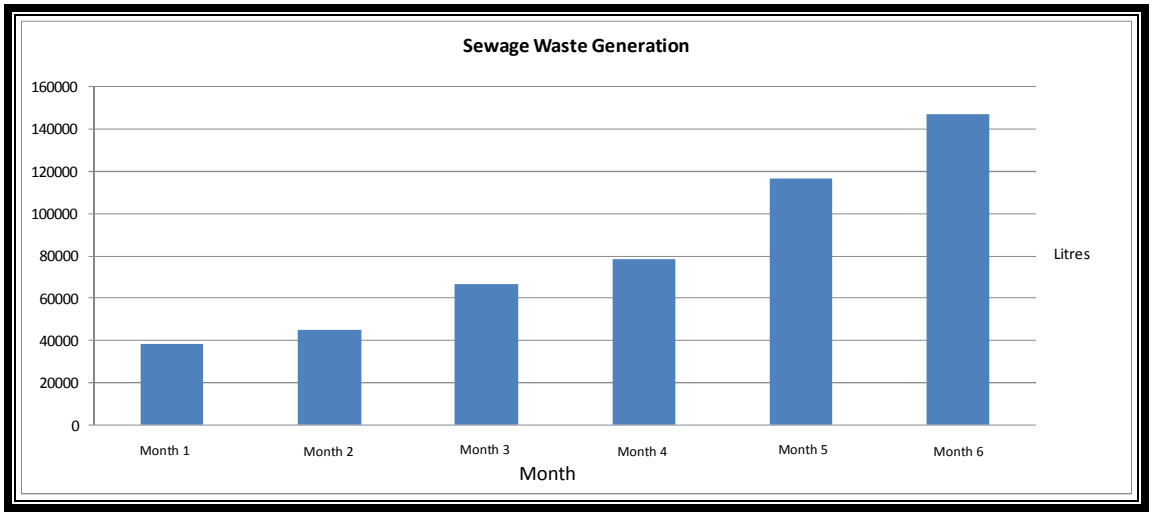

Figure 7-2: Sewage Generation (pre-GDRC implementation)

7.1.3 Construction Waste (Early Works)

7.1.3.1 Access Road

It is assumed that the amount of construction waste generated during the construction of the Access Road will be minimal, however only a small amount of formwork is expected to be needed for culvert installation. This is estimated to be approximately 500 kg or 0.5 tonnes.

In addition, the use of silt fencing will be required for protection to surrounding environment. This waste is type is estimated to be approximately 0.25 tonnes. An additional, 1 tonne is carried to account for miscellaneous construction waste items.

Therefore, based on the information above, the total amount of waste generated during the construction of the access road is estimated to be approximately 1.75 tonnes.

7.1.3.2 Accommodation Complex and Site Services Infrastructure

As with the construction of the access road, the construction of the accommodation complexes will also generate very little construction waste. Due to the

accommodations units arriving prefabricated, the estimated amount of waste generated is low, and is made up mostly of wood cuttings generated from wooden foundation cribbing and some plastic and plywood waste. It is assumed that 225 kg of wood waste would be produced per trailer. Current estimates are that 26 trailers will be needed for an approximate total of 6000 kg or 6 tonnes.

Piping for site services will be manufactured of HDPE and will be cut and fused to the desired length. Based on an estimated overall length of 4.6 km of HDPE pipe, and an assumption of 0.1 m of wastage per 15 m of pipe, with a weight of 120 kg/15 m, the total tonnage of waste generated from piping activities is .25 tonnes.

7.1.4 Used Oil (Early Works)

A considerable amount of heavy equipment will be utilized during the early phases of the Project. In keeping with necessary maintenance schedules, Contractors are required to maintain equipment and equipment fluids. During this phase, it is estimated that nearly 16,500 litres of waste oil will be generated. More information on used oil is provided in Section 6.2.1.1.

7.1.5 Explosive Boxes (Early Works)

During the early phase of this Project, the use of explosives will be necessary for excavation of the access roads. An estimated total of 1,300 cases of explosives will be required for road construction activities. Once the explosives are removed and used during construction, the cases will be destroyed as identified in Section 6.

Table 7-1: Estimated Waste Volumes (Early Works)

Waste Type	Estimated Volume
Domestic Waste	50 Tonnes
Sewage Waste	492,000 Litres
Construction Waste (includes Access Road, Accommodations Complex and Site Services	8 Tonnes
Used Oil	16,500 Litres
Explosive Boxes	1,300 Cases

7.2 WORK POST GRDC AWARD

7.2.1 Domestic Waste

The total estimated amount of domestic waste to be generated from year 1 to year 6 is 1,900 tonnes. This equates to approximately, one hundred and ninety 37 yd^3 compactor truck loads. Figure 7-3 provides the breakdown of domestic waste volume per year.

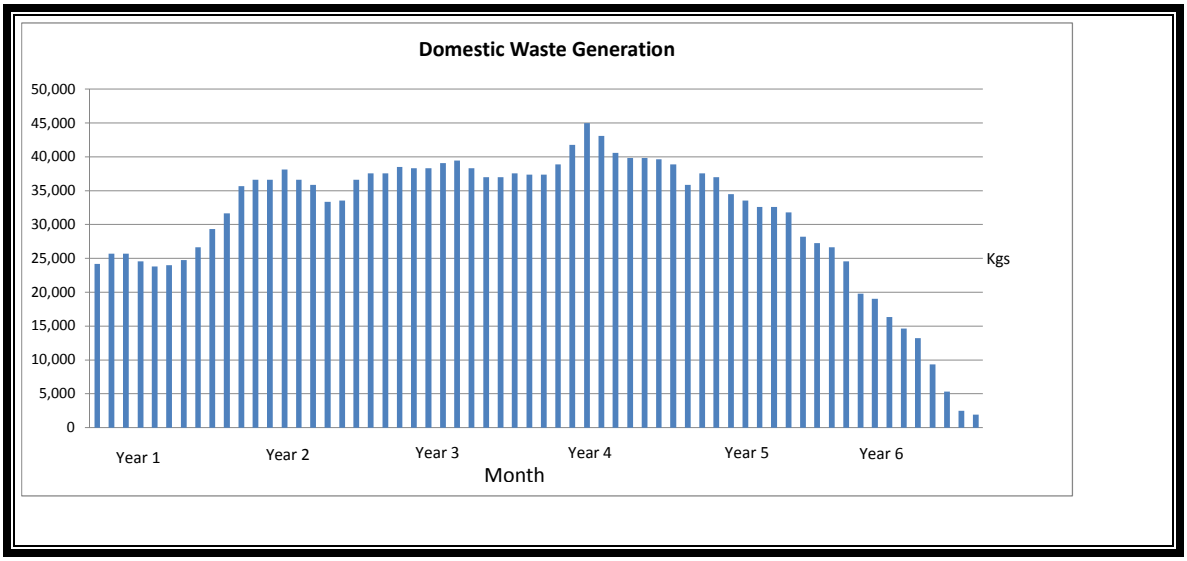

Figure 7-3: Domestic Waste Generation Year 1 to Year 6

7.2.2 Sewage Waste

Based on the assumption that the average worker generates approximately 270 L/day of sewage, the total estimated amount of sewage waste to be generated after year 1 to year 6 is estimated at 525,000,000 Litres. Although, this volume represents the total amount generated, it is expected that only 10,000 litres of sludge would be removed from the sewage treatment plant per year for a total of 50,000 litres over the life of the Project. Figure 7-4 provides the breakdown of sewage waste volume per year. More information about sewage disposal is located in Section 6.

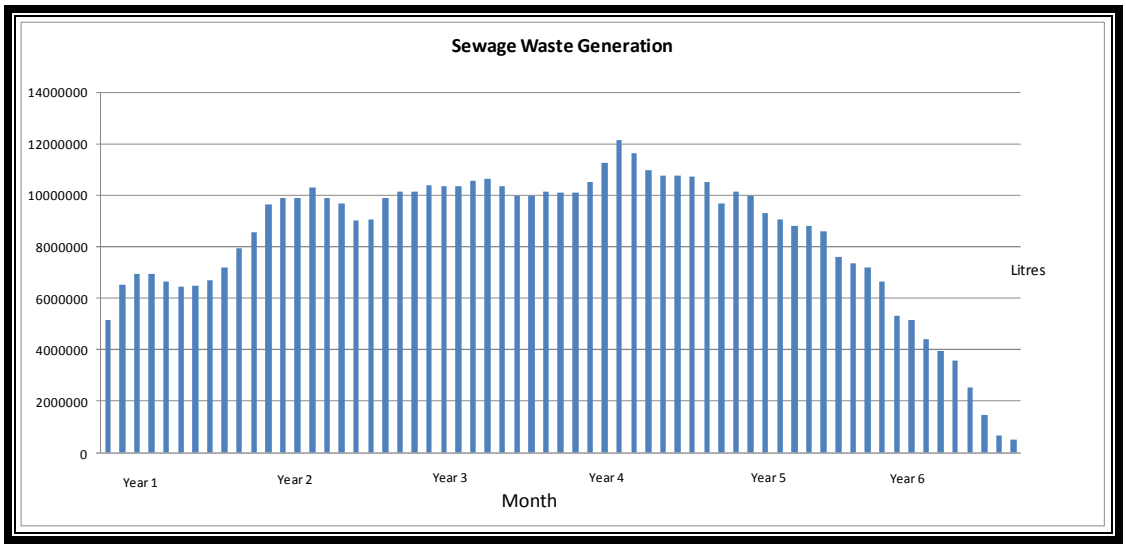

Figure 7-4: Sewage Generation Year 1 to Year 6

7.2.3 Construction Waste

Based on waste information obtained from the Bull Arm Construction Site during fabrication of the Hibernia Gravity Base Structure, the reported waste tonnage for the construction debris waste stream was 8,400 t/yr. Based on this information we can estimate a total of 42,000 tonnes over the life of this Project. Of that tonnage approximately 23,000 t is expected to be recyclable metals, including scrap rebar and with an additional 4,800 t in recyclable wood.

It is assumed that although different in scope, the LCP will likely see similar types of waste tonnages after GRDC implementation.

7.2.4 Used Oil

Similar to the section above, an estimate for waste oil is based on data obtained during fabrication of the Hibernia Gravity Base Structure. The volume of waste oil generated on site was reported to be 936,000 L/yr. This volume can be considered

comparable based on the length of the Project and types of equipment used for a total of 4.7 million litres. More information on used oil is provided in Section 6.

7.2.5 Explosive Boxes

During the later phase of this Project, the use of explosives will be necessary during bulk excavation. An estimated total of 13,000 cases of explosives will be needed to complete this work leaving 13,000 empty cases once the explosives have been utilized. More information on explosive boxes is provided in Section 6.

Table 7-2: Estimated Waste Volumes (Year 1 to Year 6)

Waste Type	Estimated Volume
Domestic Waste	1,900 Tonnes
Sewage Waste Generated to Treatment Plant Sewage Sludge Removed from Treatment Plant	525,000,000 Litres 50,000 Litres
Construction Waste	42,000 Tonnes
Used Oil	4,700,000 Litres
Explosive Boxes	13,000 Cases

8 WASTE MANAGEMENT REQUIREMENTS

As part of the overall waste management plan, the LCP is committed to ensuring that every person on site is provided with the opportunity and direction to practice responsible waste management. Waste receptacles, such as recycling and waste bins, will be strategically placed throughout the site and will be clearly labelled as to what should be placed in them. Recycling bins will be placed in heavy traffic areas, common work areas, and, most importantly, in locations where recyclables are typically generated.

The details of the waste collection/disposal requirements will be finalized with the GRDC, however the following sections discusses the anticipated requirements.

8.1 STORAGE

8.1.1 Beverage Containers

Most empty beverage containers will be generated in dining halls of the starter camp and Accommodations Complex, and at construction sites frequented by a large number of people. Empty containers at remote locations shall be collected and contained by the Contractor and transported to a designated area for storage for future recycling or directly to the licensed recycling depot.

Blue bin recycling containers are recommended for use for the collection of beverage containers due to their high visibility. The use of dedicated recycling containers will serve as a reminder for personnel to use the recycling containers instead of throwing containers into the general refuse containers. The blue bin containers will be clearly labelled BEVERAGE CONTAINERS ONLY and be placed in the following areas around the site:

- Lunch Facilities
- General Office
- Maintenance Areas

8.1.2 Residual Waste Containers

Waste receptacles shall be placed within all buildings and work areas for the collection of residual waste.

8.1.3 Roll Off/On and Front Load Containers

At minimum, it is anticipated that three wildlife proof 20' (40 yd) roll on/off containers will be needed on site to accept waste transferred from the smaller bins once they are removed from the site buildings. Two containers could be utilized for the residual waste stream, and a third will be required for substitution, when filled bins area being transported to the waste disposal site.

At least, one 7 cubic meter Front Load Container shall be placed on site to collected beverage containers. Once this bin is filled, it will be hauled to a licensed recycling depot for processing.

8.1.4 Construction and Demolition Waste Storage

During construction, individual Contractors will be responsible for collecting their wastes in acceptable containers within their workshops or laydown areas. Containers containing construction waste or large construction waste materials may be temporarily stored within the construction area upon approval on the On-site Environmental Monitor and must be stored according to applicable regulations.

Recyclable metals shall be placed in an onsite location suitable for pick up by a licensed metals recycler. Special arrangements shall be made with the recycler for large items.

8.1.5 Hazardous Waste Storage

A Hazardous Waste Storage Area will be provided for Contractors to utilize. The storage area will be designated by SLI to a Contractor for storage of hazardous waste. The Contractor shall be responsible for constructing and maintaining the site

in compliance with applicable regulations and is ultimately responsible for disposal and removal of any waste management infrastructure and equipment.

Individual Contractors will be responsible for providing acceptable leak proof containers within their work areas. Containers for on-site hazardous waste storage shall, as a minimum, meet requirements of the *Transportation of Dangerous Goods Regulations*, as provided in http://www.tc.gc.ca/eng/tdg/moc-menu-202.htm.

The Contractor shall provide SLI with records of type and amount of waste deposited in and removed from site. SLI will monitor the storage area to ensure that Contractors store waste in a safe manner. The Contractor shall ensure that containers are removed from site on an as needed basis to a licensed hazardous waste facility for disposal.

Storage shall comply with provisions of the National Fire Code to ensure that incompatible wastes are not stored together.

All Contractors that generate handle, store, and/or transport hazardous materials and hazardous wastes shall each be required to meet all regulatory requirements that pertain to their involvement with these materials/wastes. These Contractors shall have all resources (including employees who have completed training programs acceptable to the Engineer), meet all licensing/permitting requirements of applicable federal and provincial regulations, and provide spill response resources and capabilities consistent with the Project's Master Spill Response Plan.

8.2 FUTURE WASTE MANAGEMENT REQUIREMENTS

Future provincial waste management requirements may dictate the separation of various waste streams at source. In the event that a regional plan is implemented, this Waste Management Plan will require revisions and operation changes will be needed.

These changes may result in the use of additional source separation techniques and equipment.

8.3 CONTINGENCY PLANS

An adverse event is one that can result in potential negative effects on the health and safety of site personnel, Contractors, the public, or the environment. The following sections describe potential adverse events and appropriate responses to deal effectively with them.

Note that the federal *Transportation of Dangerous Goods Regulations* requires an approved *Emergency Response Assistance Plan* for those who transport explosives. Such a plan, when implemented effectively in response to an incident involving explosives, helps mitigate environmental effects.

The Project's *Master Spill Response Plan* is another document intended to facilitate an effective response to a spill incident aimed at mitigating effects of spills of oil, fuels, and other hazardous materials.

Proactive measures to anticipate and prepare for adverse events are expected of all Project participants, particularly those tasked with waste management.

8.3.1 Improper Disposal

Any instances of improperly disposed of materials identified by onsite Environmental Monitors or other Project participants shall be reported immediately to SLI's Construction Manager and Environmental Coordinator (Hydro), and investigated. The responsible Contractor shall be required to remove the waste and dispose of it in a manner acceptable to the Engineer. This will include waste characterization, as directed by the Engineer, to identify the nature of the improperly disposed of material so that acceptable storage, transport, and disposal options can be identified. If a responsible party cannot be identified, arrangements will be made by the onsite Environmental Monitor to have the waste removed and transferred for disposal. For example, recyclable material will be removed from the non-recyclable waste stream.

If hazardous wastes are suspected to be improperly disposed of, then this material will be characterized. If safe and practical to do so, the material will then be placed in

dedicated storage containers separate from other waste types that have not come into contact with the hazardous materials, and transported to and disposed of at a licensed hazardous waste disposal facility.

8.3.2 Fire

In the event of fire associated with wastes, the onsite Environmental Monitors shall be notified and the emergency response unit shall be dispatched immediately in accordance with the procedures outlined in the Project's Emergency Response Plan.

Because even small fires can quickly escalate into a dangerous situation, particularly when hazardous materials (fuels, chemicals, etc) and wastes are involved, it is imperative that the emergency response unit be dispatched immediately.

As a pro-active measure aimed at preventing fires, Contractors shall use approved storage containers and waste handlers shall be familiar with hazardous waste compatibility profiles. Non-compatible wastes will be segregated.

8.3.3 Extreme Weather Conditions

At times when forecasts call for extreme weather events (e.g. snow, rain, wind, etc), the Construction Manager at his/her discretion shall issue instructions with respect to waste management activities on site. This may include a temporary suspension of waste collection and transportation until the weather improves. In addition, the Construction Manager may also issue instructions to inspect and secure waste containers and storage sites to reduce potential for uncontrolled releases of waste to the environment.

Provisions will be made to allow at least two days of waste storage on site to allow for such adverse weather conditions.

8.3.4 Vehicular Accidents

In the event of a vehicular accident that results in a spill of a waste material, the Contractor shall notify a SLI Onsite Environmental Monitor of the incident and the emergency response unit will be dispatched immediately in accordance with procedures outlined in the Project's Emergency Response Plan and Master Spill Response Plan, as required.

Depending on the waste type, the Contractor may be required additional notifications. In the case of accidents involving transport of explosives, the *Emergency Response Assistance Plan* shall be implemented, in accordance with provisions of the *Transportation of Dangerous Goods Regulations.*

8.3.5 Contingency Planning

Each Contractor shall address several key elements associated with managing an adverse event through the development of a contingency plan which shall be included in the contract specific EPP. The plan shall include the following:

- Location and nature of the work;
- Types of waste being transported;
- Identification of the types of emergencies that maybe reasonably expected to occur and the potential effect involving public health and safety, environment and property;
- Resources including personnel and/or sub-contractors accountable for waste management procedures;
- Roles and Responsibilities of all key personnel, responders, organizations and other agencies who have specific responsibilities under the event.
- Description of how the plan shall be implemented and who it shall be reported to, including;

  - Government assistance contacts
  - Response equipment and material suppliers
  - Clean up Contractors
  - Fire and Emergency Authorities
  - Hospitals
  - SLI Contact
- Remediation Procedures
- Disposal procedures
- Reporting procedure, including:
  - Date and time of release;
  - Weather conditions;
  - Cause of the release;
  - Substance and quantity involved;
  - Affected environment;
  - Identification of all parties and individuals involved in the incident and response;
  - Identification of all those affected;
  - Containment procedure;
  - Clean up techniques;
  - Short and long term impacts
  - Measures to be implemented to prevent any re-occurrence.
- Validation, updating and maintenance procedure of the plan

9 TRAINING

All operations personnel involved in the handling of hazardous and non-hazardous wastes will be fully trained for 'Personal Safety and Protection'. They will also be trained in emergency response and environmental protection. Contractors will be required to provide trained, qualified and experienced personnel for waste management duties. In addition, all personnel entering the site will be given basic instructions for complying with the Site Waste Management and Recycling Policy.

10 SURVEILLANCE AND MONITORING

The onsite Environmental Monitors will proactively identify any requirements for maintenance work and report the need for repairs. Routine inspection schedules will be maintained to minimize the potential for leaks or pollution and a record will be kept of the maintenance needs and servicing performed. During construction, weekly inspections of the various waste collection and disposal points, the inventory of bulk wastes, the waste management data sheets, the status of the protective equipment and the spill kits will take place. Any non-conformance will be tracked and recorded and necessary corrective action identified.

APPENDIX A

Examples of Acceptable Wildlife - Proof Disposal Bins

BearSaver
Bear Resistant Refuse, Recycling
and Food Storage Solutions

BE Series Trash/Recycling Container

Manufactured by the North American leaders in bear-resistant containers.

Available in single and double configurations, the large capacity Model BE Series containers are equally suited for refuse or recycling. Incredible quality and durability makes these all-weather containers great for any application.

- Tilt Out Bag Rack
- Bear-Resistant and Accessible to Persons with Disabilities
- 70 Gallon Single Models and 140 Gallon Double Models Available
- Rear Service Door
- Optional Custom Laser Cut Designs
- Refuse, Recycling, or Combo Configurations
- Corrosion Resistant Materials and Powder Coated Finishes
- Standard Colors are Forest Brown, Fir Green, Olive Green, Blue and Black

CE Series Trash/Recycling Container

Available in single and double configurations, the CE Series trash and recycling containers are used widely by the NPS and USFS with great success. These heavy-duty, ADA approved products are a good choice where accessibility compliance is required. The top-loading pull down chutes make these models operable even with a closed fist. Uses a standard 32 gallon trash can inside.

- User Friendly Loading Chutes for Trash and Tubes for Recycling
- Bear Resistant and ADA Compliant
- Front Service Door
- Trash, Recycling, or Combo Configurations
- Corrosion Resistant Materials and Powder Coated Finishes
- Standard Colors are Forest Brown, Fir Green, Olive Green, Blue and Black

HA Series Trash/Recycling Container

Manufactured by the North American leaders in bear-resistant containers.

Available in single and double configurations, the Model HA Series containers are equally suited for trash or recycling. Incredible quality and durability makes these all-weather containers great for any application. The stylish design allows placement in locations like visitor centers and downtown city streets where aesthetics are important.

- Bear-Resistant and ADA Compliant
- Front Service Door
- Optional Recycled Plastic Wood Siding or Custom Laser Cut Designs
- Trash, Recycling, or Combo Configurations
- Corrosion Resistant Materials and Powder Coated Finishes
- Standard Colors are Forest Brown, Fir Green, Olive Green, Blue and Black

HID-A-BAG Trash/Recycling Container

Available in four sizes with trash, recycle or combination options.

Also available in single or double configurations, some models are even ADA Compliant! The Hid-A-Bag is a well known, widely used line of products with a long standing track record of exceptional durability.

- Tilt Out Bag Rack
- Bear-Resistant
- Options that are Accessible to Persons with Disabilities
- 32, 64, 70 and 140 Gallon Models Available
- Rear Service Door
- Refuse, Recycling, or Combo Configurations
- Corrosion Resistant Materials and Powder Coated Finishes
- Standard Colors are Forest Brown, Fir Green, Olive Green, Blue and Black

Food Storage Lockers

Manufactured by the North American leaders in bear-resistant containers.

BearSaver Bear-Resistant Food Storage Lockers are rugged, high quality metal enclosures designed for safe and convenient food storage in campgrounds, picnic areas and trailheads. Our intermediate sized lockers are 15 (FS15) and 20 cubic feet, which are perfect for smaller campsites and trailheads. The 24 (FS24) and 30 (FS30) cu/ft lockers are large enough to hold an entire family's food supply including two large ice chests.

The **BearSaver** latching system uses a pocket style touch latch with double spring bolt actuation on its standard enclosures. Our pocket style, self-closing touch latch is composed of zinc plated steel components and hardware. A child safety release handle on the inside of the enclosure is provided. The design is very simple for users to operate but is beyond the capabilities of bears. It has a clean, attractive appearance and is ADA compliant in terms of height, reach and required pounds of operating force.

Model FS15
15 Cubic Foot Capacity Food Storage Locker
This small to intermediate sized food storage locker is perfect for trailheads, day use areas, tent cabin areas and small campsites. There is a center shelf built in to take advantage of the 15 cubic foot capacity. With provisions to bolt side-by-side, these lockers can easily be lined up for group usage.

Model FS20
20 Cubic Foot Capacity Food Storage Locker
This is an economically priced, intermediate sized food storage locker with enough capacity (20 cubic feet) for a regular sized cooler and room left over for a few dry goods. Primarily used in campsites, the FS20 can also be used at trailheads and public use areas.

Model FS24
24 Cubic Foot Capacity Food Storage Locker
One of most popular models, the FS24 has enough capacity (24 cubic feet) for a family who is camping for a week. There is room for two regular sized coolers and plenty of space left over for dry goods. Always paying attention to detail we have added hooks on the ceiling of the locker for hanging bags of dry goods. These heavy-duty enclosures with easy to use, selflatching doors will provide years of reliable services in all weather conditions.

Model FS30
30 Cubic Foot Capacity Food Storage Locker
Our largest and best selling food storage locker, the FS30 has a full 30 cubic feet of interior space to accommodate large families on extended stays. With the capacity to hold the largest of coolers and lots of dry provisions, this big locker removes the worries associated with keeping food in your car overnight.

Models FS24RCE and FS26G
These new style food storage lockers are unique in design and made for large families. The sloped roofs are great for heavy snow loads with all the quality and durability you would expect from BearSaver.

RCE Series Residential Waste Enclosures

Manufactured by the North American leaders in bear-resistant containers.

Our line of residential waste enclosures keeps with the BearSaver tradition of producing tough, functional, long lasting outdoor equipment. The RCE Series enclosures are manufactured using the same materials and finishes as our line of commercial trash enclosures, which are used widely throughout the U.S. and Canada. Our proven, field tested outdoor enclosures will provide years of trouble-free service in all weather conditions. If you are looking to keep hungry bears out of your trash, BearSaver has the solution you need.

Available in 3 Sizes

- **RCE130F** Holds (1) 30-gallon Rubbermaid can (included with purchase). This model has a slim profile and can be easily bolted side-by-side for added capacity.
- **RCE230F or RCE230G** Holds (2) 30-gallon Rubbermaid cans (included with purchase) and has a large top-loading lid. Available with sloped or gabled roof.
- **RCE132F** Holds (1) standard 32-gallon can (not included) and can be bolted side-by-side for added capacity.
- **RCE330G** Holds (3) cans 30-gallon Rubbermaid cans (included with purchase) and has a gabled roof.

All models have provisions to either bolt down to a slab or use the BearSaver pole mount installation method. See website for details.

Mini Depot Trash/Recycling Container

Designed to hold three different recyclables, the Mini Depot can be configured just by changing the decals. Standard openings are 5" x 5" but a 5" x 10" opening can be ordered in the center position for trash input. Heavy steel construction insures years of service in the most demanding environments. With a baffle plate installed on the inside beneath the loading holes, bears (or people) cannot remove the contents.

- **Easy Loading and Unloading**
- **Bear Resistant and ADA Compliant**
- **Lockable Front Service Doors, 90 Gallon Capacity**
- **Trash, Recycling, or Combo Configurations**
- **Corrosion Resistant Materials and Powder Coated Finishes**
- **Standard Colors are Forest Brown, Fir Green, Olive Green, Blue and Black**

Commercial Containers

Manufactured by the North American leaders in bear-resistant containers.

Standard dumpsters with two loading doors are available in front load 2, 3, and 4 yard sizes. Counter-balance lid dumpsters are available in front load 2, 3, 4, 5 and 6 yard sizes. The standard dumpsters have front loading, swing-open doors so getting trash or recyclables inside is easy and clean. The counter-balance lid dumpsters use a creative latching system that requires only one finger to open. The counter-balance effect makes the tops light and easy to open. On either model, dumping is made easy by gravity latches releasing the unloading lid during the emptying process. Clip-down lids are also available as an option.

- **2, 3 and 4 Yard Front Load Styles for Trash**
- **Pole Mounting Options to Avoid Tipping**
- **Gravity Latches or Clip-Down Lids**
- **Bear-Resistant and Rodent Proof**
- **Corrosion Resistant Materials and Powder Coated Finishes**
- **Standard Colors are Forest Brown, Fir Green, Olive Green, Blue and Black**

Bear Resistant Poly Cart

The BearSaver™ bear-resistant carts are available in 32, 65 and 95 gallon sizes as well as three (3) levels of protection: basic, moderate and high.

- Special latch box under the bib prevents animal entry
- Snap shut lid means no manual relatching is required
- Designed for manual and semi-automated collection systems

Cart Options

The Grizzly Model A fully secured cart offering the maximum level of protection. Bear resistant latch, steel reinforced side rails, lid, back corners, back stiffener and handle area. Perfect for heavy bears like grizzlies.

The Black Bear Model A tough black bear resistant cart offering a medium level of protection. Bear resistant latch, steel reinforced side rails, back corners and lid.

The Varmint Model The economy version of our rolling cart family. Great protection from raccoons, squirrels, coyotes, pets and all other small animals. A bear resistant latch and steel reinforced lid offers "lock down" protection at an affordable price.

TABLE of CONTENTS

1.0 Purpose

This Security Management Plan will define the methods used to determine the level of threats and security preparedness required to effectively address these identified threats at all construction sites for the Lower Churchill Project (hereafter referred to as LCP or the Project). The operational basis of this plan has been developed in accordance with information generated from an initial project threat assessment conducted by an independent third party consultant in December of 2011.

The physical environment of infrastructure of the Muskrat Falls construction camp and support systems will be designed and managed to reduce the potential of security related incidents/unwanted events. A risk assessment has been conducted to define those areas or zones where the security threats are and how these can be adequately mitigated any known or perceived risk. The Security Management Plan must remain an "evergreen" document to allow for changes in focus, site conditions, threats/risks and mitigating actions. Any changes to this document will be forwarded to all responsible individuals via document processing/document control/Aconex. The Security Management Plan is an integral component of the overall LCP Security Management strategy.

2.0 Scope

The scope of the LCP Security Management Plan consists of the following construction work sites and auxiliary support sites to be effectively managed from a Security perspective:

- Muskrat Falls Generation Facility
- Labrador Island Transmission Link (LITL)
- Labrador Transmission Asset (LTA)
- Miscellaneous Lay Down Areas
- Project Office (s)- Torbay Road/Hydro Place/Happy Valley-Goose Bay Office

Refer to **Attachment #1** for the LCP Project Schematic for additional information.

Other areas that have been considered and included in this plan, as and when applicable, are:

- Public access buildings

- Marine ports

3.0 Definitions

Access Control System - A system having several features which enable a designated authority to control access to physical areas or information and resources within a given facility. This often consists of physical barriers (static and automated) and access interfaced to a computer-based information system.

Authorized Worker – Any worker who has fully met all training and testing requirements stipulated by the NALCOR / SLI and deemed to be fully competent to work within his/her defined work scope on the project. Additionally, this definition shall include those individuals who, over time, remain in good standing with all training and site access requirements.

Authorized Escort – A contractor or subcontractor representative who has completed site orientation, is fully aware of the site's emergency response and evacuation procedures, and has the authority to accompany visitors.

EPCM – Engineering, Procurement, and Construction Management Consultant- Refers to a contracted company providing technical support services under the direction and management of Nalcor. For the Lower Churchill Project the EPCM Consultant is SNC-Lavalin.

Host – A contractor or subcontractor representative who has been authorized to invite non-project personnel to the project site and receives prior clearance from the Muskrat Falls Site Management or Transmission Line Management beforehand.

Visitor – Any non-project person(s) visiting the project construction site including, but not be limited to vendors, couriers, delivery personnel, regulatory personnel, consultants, engineering representatives, stakeholders and other personnel not assigned to the site.

Badges – Purpose-specific credentials or devices which identify the bearer by electronic signature and photographic confirmation of the bearer. Badges also act as an access tool that interface with a computer based system which activates gates, turnstiles or other physical barriers designed to restrict access.

Temporary Badges – A temporary credential issued to individuals who have been authorized to access the LCP on a limited or temporary basis. Temporary badges are intended to be used in conjunction with Authorized Escorts, and shall be returned to security when visit is completed and/or permanent badge is issued.

Qualified and Competent Security Personnel – Security personnel who, as a minimum, have met all work scope criteria and job stipulations and successfully completed a nationally or provincially recognized security training, supplemented by a minimum of 2 years security work experience in a construction type environment.

4.0 Responsibilities

4.1 Project Component Manager(s)

The Project Component Manager(s) shall ensure all Contractors are fully informed of the security stipulations and requirements defined within this plan, as well as any changes or modifications made to the plan during the course of the Project. Additionally, the Project Component Manager(s) shall ensure all necessary resources; personnel and training, etc. are provided to adequately meet the requirements as defined by this Plan.

4.2 LCP Project Health and Safety Manager

The LCP Project Health and Safety Manager shall be responsible for the overall implementation and management of this Project Security Management Plan. The LCP Project Health and Safety Manager for will also provide oversight and on-going management through direct interface with:

- EPCM Health and Safety Personnel
- Muskrat Falls Site Manager and Site Management Team
- LCP Component Managers
- Telecommunications
- Security Service Provider
- Nalcor Corporate Management Team
- SOBI Crossing Project Manager/Project Team

The SOBI Crossing Project Manager and SOBI Health and Safety Advisor shall be accountable for ensuring that Management of Security is implemented and maintained for the SOBI operations/activities. The Contractor's responsibility for Site/Vessel Security will be clearly defined contractual agreements and verified by the SOBI Health and Safety Advisor.

4.3 Muskrat Falls Site Health and Safety Manager; Site Health and Safety Coordinator/Advisor

The Muskrat Falls Site Health and Safety Manager and Site Health and Safety Coordinator shall also coordinate and consult on incident investigations, secure required documentation and facilitate, through the security contractor, the site badging and induction process for all contractor and subcontractor personnel entering the project site. The Site Health and Safety Coordinator shall also collect and report all metrics and documentation as established by the Muskrat Falls Site Manager and LCP Health and Safety Manager

The Site Health and Safety Manager shall liaise with all Contractor supervision to address issues that arise concerning the security of LCP, tools and equipment.

For SOBI Operations, The SOBI Health and Safety Advisor shall monitor and observe the implementation and maintenance of Security Practices and Principles on SOBI Sites and Contracted Vessels during the execution of the scope of work.

4.4 Field Emergency Response and Security Coordinator

The Site Emergency Response and Security Coordinator shall:

- Supervise and serve as the primary day-to-day point of contact for the Security services provider in relation to establishing processes and systems needed to adequately secure the project site. Ensure the full implementation, enforcement and general application of the Security Management Plan.

- Reviews and recommends (for approval) any request for resources by Security Provider.

- Functions as the key point of contact for the Security Provider. Additionally, this position oversees and monitors the third party Security Provider to ensure all requirements and commitments outlined in the written contract are adhered to and/or effectively executed.

- Conduct periodic site inspections from a site security perspective,

- Prepare loss and incident reports and liaise with subcontractor supervision in relation to property losses and./or investigations and ensure all personnel under their authority fully comply with all provisions and stipulations within the Security Management Plan.

- Monitor the plan's performance and assess the security contractor on a regular basis to ensure suitability and overall effectiveness.

- Identify areas that require further threat assessment as the project develops and/or changes. This shall include a security assessment for marine ports and the transmission line construction areas, as and when required.

- Coordinate and assist, as required, local law enforcement in the investigation, collection of evidence and resolution of criminal activity on the LCP Construction Site.

- Participate in all supervisory safety meetings and report all required security metrics and data to the Site Health and Safety Coordinator for correlation and report to the Muskrat Falls Site Manager. The security coordinator must be responsive to project management to report on relevant security issues as required.

4.5 Contractor Security Personnel

Qualified and competent Security personnel will be responsive to the needs and requirements as outlined in the "**Authorization Protocol for Access to Project Construction Sites (LCP-PT-MD-0000-HS-PR-0001-01)**", as well as the directions of the Security and Emergency Response Coordinator and Site Health and Safety Manager. Security Officers will visually check all worker's ID presented for access to the Muskrat Falls jobsite and resolve any discrepancies before the badge bearer is permitted entry into the project site. Security officers will continue to monitor the workforce through the audit process to ensure that all personnel on site have the appropriate level of access prior to entry.

A security gate will be positioned at the entrance to the forestry access road from the Trans-Labrador Highway. During active construction, the gate will be manned on a 24 hours per day, 7 days per week. Initially, a temporary facility will be installed at the location (small trailer with generator to provide power, washroom facilities, cellular and satellite phone as well as VHF radio with the clearing and road construction contractors' frequencies). A list of personnel and vehicles involved with the road clearing and construction will be provided to the security personnel for site access. All vehicles approaching the entrance to the gate will be checked to ensure that the personnel and vehicles are authorized to enter. The lift gate can be left open when there are security personnel at the control position. The gate will be closed and locked when security personnel are not present at the control position.

The purpose of the security presence at this gate is to limit/control access to Muskrat Falls site. The following risks have been identified as Moderate to High level Risks.:

- Transportation of illegal contraband (drugs and alcohol) to/or from the construction site, which could have an adverse impact on personnel and activities. Impacts may include equipment damage, vehicle accidents and personnel injury. (Risk: Moderate)
- Theft/unauthorized transport of contractor/contractor property from the construction site. Impacts may include project delays, as well as financial impacts to contractor/company. (Risk: Moderate)
- Unauthorized access of on-lookers/curiosity seekers onto the site. Impacts may include endangerment of site personnel and/or unauthorized personnel due to the inherent dangers of the work activity combined with the distractions that may be caused by unauthorized personnel, as well as increased risk of unauthorized vehicles impacting construction site transportation patterns which could results in vehicle accidents and potential liability for Nalcor. Although the site will be sign posted advising all personnel that it is company premises and authorization is not allowed, access via snowmobiles, four wheelers, etc. is quite possible. (Risk: Moderate)
- Unauthorized demonstrations/protestors at the site entrance. Impacts may include hampered access, work stoppage and potential sabotage incidents endangering personnel, equipment which could result in work delay and/or work stoppage. (Risk: Major)

As a result of the aforementioned risks, the following protocols will be instituted:

- A Security Guard Station will be constructed a safe distance from the Trans-Labrador highway so as not to impede routine traffic on the highway at any time. Provisions will be made to direct oncoming traffic to a staging area (along the side of the access road) in the event of high traffic volume.
- The Security Guard Station will have a full time lockable gate to control access and will be manned by two Site Security Personnel at all times. One of the guards will be checking documentation and authorizations for site entry, while the other guard will be unlocking the gate, checking the vehicle for contraband or suspicious behaviour.
- The Security Guard Station will be manned and operational on a full time (24 hour) basis.

- If a security guard suspects an individual(s) to be transporting illegal contraband to the site or demonstrating irregular behaviour, the guard should contact the Muskrat Falls Site Manager to advise the situation and detain the individual until contract is made. Any personnel found to be transporting illegal contraband or demonstrating irregular behaviour will be asked to leave the site immediately and will not be allowed to return to the site.
- If the Security Guard suspects and unauthorized removal of equipment/property has taken place, he must advise the Muskrat Falls Site Manager and have him address the issue with the individual in question.
- In the event that unauthorized personnel are found to be trespassing on the site, they will be asked to leave immediately. In the event they refuse to leave, the RCMP will be contacted by Security to remove these personnel from the site.

In the case that members of the public arrive at the security gate with questions related to the road construction they will be politely directed to contact the Happy Valley/Goose Bay Nalcor Office. In the event protestors/demonstrators are at the site entrance of on the site. Site Security will notify the Muskrat Falls Site Manager and advise him of the situation. The Muskrat Falls Site Manager will contract the RCMP, particularly if the situation escalates. If protestor/ demonstrator actions are inhibiting work activity, Nalcor operations may be shut down and Nalcor Project Management (through the Muskrat Falls Site Manager) may elect to file an injunction to have these personnel removed from the site, which would be private property.

The project office located at the Muskrat Falls Construction Site Area is currently only accessible to authorized project personnel though the main gate clear security. All visitors to the site are required to complete a "Remote Site Access Request Form, which must be approved by the Muskrat Falls Site Manager, the LCP Safety and Health Manager, as well as the Project Manager. Refer to Section 11 of this document for more information pertaining to Visitor Access. Once access is gained into the site, the electronic swiping process is further supplemented by a sign in/sign out requirement at the main gate Visitors cannot enter the site until Site Security verifies the visit has been pre-approved as per the Remote Site Access Procedure. As per the visitor policy, visitors are required to sign in and sign out at the main gate and are to remain in the Main Gate Area until the appropriate project person arrives to meet the visitor. Visitors are to be escorted full time by the respective project representative for the duration of the visit to the office.

Security personnel will be involved as a key point of contact in emergency response activities, journey management and other general communications on site 24 hours per

day / 7 days a week. Additionally, security officers will be required to conduct the following:

- Periodic site inspections of the jobsite to determine if the perimeter is secure,
- Periodic inspections of all bags and packages entering the worksite;
- Periodic examination of all lunchboxes and personal packages leaving the Muskrat Falls site;
- Inspection of camp rooms as a result of reasonable suspicion (as defined under the Muskrat Falls Camp Rules) for drug and/or alcohol use.
- Inspections of all vehicles entering and leaving the Muskrat Falls site;
- Oversite and enforcement of site speed limits and conduct regular checks of their assigned area for security violations or activities of a suspicious or undesirable nature and report them to the Security Supervisor.
- Security officers shall also assist in all incident investigations, as required, relevant to health and safety observations and associated security matters.

For sites other than Muskrat Falls, Site Contractors may be required to provide Security Officers responsible for carrying out security duties. The Security Officers will be responsible for interfacing with contractors and assisting, as required, on supporting contractor's security plan. Coordination of joint security planning with contractors will require the overall communication and coordination with the site Health and Safety Coordinator for this scope of work. Should gated facilities be erected at Sub Station construction sites, security officers will be responsible for controlling and managing access and egress from these sites

4.6 Contract Workers, Visitors and Other Personnel

All workers, visitors and other personnel having reason to physically enter the Muskrat Falls site shall adhere to the requirements of this plan by attending all required training, providing required personal information, submitting to applicable drug and alcohol testing protocols and inspection, and meeting all other requirements as defined under the plan.

5.0 Security Threat Assessment

The level of security protection will vary for each area of the LCP based on risk exposure and probability of incident occurrence.

A Security Threat Assessment is the process that is used to determine the security threat (s) to the project, and is in line with the risk assessment process. The Threat

Assessments noted below utilize the LCP Risk Matrix for evaluating security related threats: The security threat assessment is normally used in areas such as:

Muskrat Falls Generation Site (North Spur and South side) Security Threats may include the following:

- Unauthorized entry into the site; **(Risk- Moderate)**
- NGO Protest Groups blocking site access (materials, equipment, personnel, emergency access); **(Risk- Major)**
- Theft of computers, proprietary information, equipment, supplies, fuel, materials- including explosive or flammable materials, tools; **(Risk- Moderate)**
- Vandalism of company or contractor property, structures, equipment, materials; **(Risk- Moderate)**
- Sabatoge of company/contractor equipment, materials, supplies, fuel; **(Risk-Moderate)**
- Bomb threat event at the construction site or accomodations. **(Risk- Moderate)**
- Emergency evacation of the site (due to wild fire, flooding, hazardous weather conditions or other unforeseen weather related and natural disaster event) leaving equipment, materials, computers, etc. exposed for theft. **(Risk-Moderate)**
- Hunting/trapping on designated company property endangering site personnel; **(Risk-Moderate)**
- Unauthorized personnel at site locations while hazardous operations/tasks are underway (blasting, heavy lifts, excavation/trenching, loading, heavy equipment operations, high voltage work activities). **(Risk-Moderate)**
- Personnel operating equipment/vehicles or working on site while under the influence of alcohol or drugs. **(Risk-Moderate)**
- Driving on site at unsafe speeds, without seatbelts, while using cell phones or in an otherwise wreckless manner. **(Risk-Moderate)**
- Violence at the site/camp (fighting, weapons, firearms, other violent behaviour/action) **(Risk-Moderate)**

Soldier's Pond and Churchill Falls Security Threats may include the following:

- Unauthorized entry into the site; **(Risk- Moderate)**
- Protest/aboriginal groups blocking site access (materials, equipment, personnel, emergency access); **(Risk- Moderate)**
- Theft of computers, proprietary information, equipment, supplies. **(Risk- Minor)**
- Vandalism of company or contractor property, structures, equipment, materials; **(Risk- Moderate)**
- Sabatoge of company/contractor equipment, materials, supplies, fuel; **(Risk-Minor)**
- Bomb threat event at the construction site or accomodations. **(Risk-Minor)**
- Emergency evacation of the site (due to wild fire, flooding, hazardous weather conditions or other unforeseen weather related and natural disaster event) leaving equipment, materials, computers, etc. exposed for theft. **(Risk-Moderate)**
- Hunting/trapping on designated company property endangering personnel working on site; **(Risk-Moderate)**
- Unauthorized personnel at site locations while hazardous operations/tasks are underway (heavy lifts, high voltage work activities). **(Risk-Moderate)**
- Personnel operating equipment/vehicles or working on site while under the influence of alcohol or drugs. **(Risk-Moderate)**
- Driving on site at unsafe speeds, without seatbelts, while using cell phones or in an otherwise wreckless manner. **(Risk-Moderate)**
- Violence at the site (fighting, weapons, firearms, domestic violence). **(Risk-Minor)**

Security Threats for **Transmission Lines** may include the following:

- Unauthorized entry into the transmission line temporary site; **(Risk-Moderate)**
- Protest/aboriginal groups blocking site access (materials, equipment, personnel, emergency access); **(Risk-Moderate)**

- Theft of computers, proprietary information, equipment, supplies, fuel, materials- including flammable materials, tools; **(Risk-Moderate)**
- Vandalism of company or contractor property, structures, equipment, materials; **(Risk-Moderate)**
- Sabatoge of company/contractor equipment, materials, supplies, fuel; **(Risk-Moderate)**
- Bomb threat event at the temporary site or accomodations. **(Risk-Moderate)**
- Emergency evacation of the site (due to wild fire, flooding, hazardous weather conditions or other unforeseen weather related and natural disaster event) leaving equipment, materials, computers, etc. exposed for theft. **(Risk-Moderate)**
- Hunting/trapping on designated company property endangering site personnel; **(Risk- Moderate)**
- Unauthorized personnel at site locations while hazardous operations/tasks are underway (heavy lifts, loading, heavy equipment operations, high voltage work activities). **(Risk-Moderate)**
- Persons camping on the Right-Of-Way. **(Risk-Moderate)**
- Personnel operating equipment/vehicles or working on site while under the influence of alcohol or drugs. **(Risk- Moderate)**
- Driving on site at unsafe speeds, without seatbelts, while using cell phones or in an otherwise wreckless manner**. (Risk-Moderate)**
- Violence at the site/camp (fighting, weapons, firearms, other violent behavior/action.) **(Risk- Minor)**

Security Threats for **Marshalling Yards** may include the following:

- Theft of equipment, supplies, fuel, materials- including explosive or flammable materials, tools; **(Risk- Major)**
- Unauthorized entry into the site; **(Risk-Moderate)**
- Protest/aboriginal groups blocking site access (materials, equipment, personnel); **(Risk-Moderate)**
- Vandalism of company or contractor property, equipment, materials; **(Risk-Moderate)**

- Sabatoge of company/contractor equipment, materials, supplies, fuel; **(Risk-Moderate)**
- Emergency evacation of the site (due to wild fire, flooding, hazardous weather conditions or other unforeseen weather related and natural disaster event) leaving equipment, materials, etc. exposed for theft and/or damage. **(Risk-Minor)**
- Unauthorized personnel at site locations while hazardous operations/tasks are underway (heavy lifts, loading, heavy equipment operations). **(Risk-Minor)**
- Personnel operating equipment/vehicles or working on site while under the influence of alcohol or drugs. **(Risk- Moderate)**

Security Threats for the two **Electrode Sites** may include the following:

- Unauthorized entry into the site. **(Risk-Moderate)**
- Theft of equipment, materials (primarily copper). **(Risk-Moderate)**
- Individuals going into the water (without authorization) **(Risk-Minor)**
- Sabatoge of any accessible equipment, supplies, materials on site. **(Risk-Moderate)**

Security Threats for the **Transition Compounds** may include the following:

- Unauthorized entry into the compound. **(Risk-Moderate)**
- Theft of equipment, materials. **(Risk-Moderate)**
- Sabatoge of any switchgear, connections, etc. at the site. **(Risk-Moderate)**
- Unauthorized operation or tampering of switchgear, connections, etc. at the compound. **(Risk-Moderate)**
- Vandalism of any equipment or materials within the compound. **(Risk-Moderate)**
- Unauthorized personnel at site locations while hazardous operations/tasks are underway (hook-up, commissioning and energization) **(Risk-Moderate)**

Security Threats for **Laydown Areas** include the following:

- Unauthorized entry onto the laydown areas **(Risk-Moderate)**

- Theft of equipment, supplies, materials, tools. **(Risk-Moderate)**
- Vandalism of company property, equipment, materials. **(Risk-Moderate)**
- Sabatoge of company equipment, materials, supplies stored in the laydown areas. **(Risk-Moderate)**
- Unauthorized entry into the site while hazardous operations/tasks are underway. **(Risk- Minor)**
- Personnel operating equipment/vehicles or working in the laydown area while under the influence of alcohol or drugs. **(Risk-Moderate)**
- Driving on in the laydown area at unsafe speeds, without seatbelts, while using cell phones or in an otherwise wreckless manner**. (Risk-Moderate)**

Security Threats for the **Project Offices (Happy Valley/Goose Bay and Torbay Road Office)** include the following:

- Unauthorized entry into the Project Offices. **(Risk-Moderate)**
- NGO Protest Groups blocking office access (proprietary information/ reference materials/documentation/reference materials, equipment, personnel, emergency access, Emergency Operations Centre); **(Risk-Moderate)**
- Theft of equipment, supplies, computers, printers, proprietary information **(Risk-Moderate)**
- Vandalism/Sabatoge of company or contractor property, structures, equipment, materials; **(Risk-Minor)**
- Bomb threat event at the Project Office. **(Risk-Moderate)**
- Emergency evacation of the Office(due to fire, flooding, hazardous weather conditions or other unforeseen weather related and natural disaster event) leaving equipment, materials, computers, etc. exposed for theft. **(Risk-Moderate)**
- Violence at the office (fighting, weapons, firearms, other violent behaviour/action) **(Risk-Minor)**

Other areas that may be included in this plan are:

- **Public access buildings** (Security Treats may include theft, vandalism, sabatoge, NGO Protests) **(Risk-Moderate)**
- **Marine ports** (Security Treats may include theft, vandalism, sabatoge, NGO Protests) **(Risk-Moderate)**
- **Highways** (Security Threats may include blockades by NGO Protest Groups, significant weather conditions or serious vehicle incidents limiting or prohibiting site access, emergency response) **(Risk-Moderate)**
- **Airports** (Security Threats may include serious aircraft (fixed wing or helicopter) incidents adversely impacting company personnel and site operations). **(Risk-Moderate)**

In general terms, it can be expected that periodic disruptions from the NGO's at or near the construction site gates will occur. The scope and depth of any civil disobedience on their behalf will vary depending on personnel involved, but it is believed that this threat potential will exist throughout the duration of the project and could have an adverse impact upon construction deadlines, occupational health and safety issues and community support and relationships.

Many of the proponents have expressed concern that illegal organized criminal activity will flourish in the community. There are some indications that some organized criminal groups are making efforts to entrench themselves in the community. As a result, there will likely be an increase in the distribution, sale and use of illegal drugs, the primary focus being the construction workforce which will reach 1500 at peak stages of the project. Ongoing police intelligence indicates that there is a significant amount of hard drugs, i.e., cocaine, crack cocaine, coming into the area from Montreal and Toronto. This will have a knock-off effect and potential impact upon health and safety at the camp and worksites. As a result, the **LCP Drug and Alcohol Standard (*LCP-PT-MD-0000-LR-SD-0001-01)*** has been approved and in place for LCP Construction Sites, to mitigate risk. Drug and Alcohol testing will be carried out for pre-access and post incidents. Additionally all personnel are requested to be viligant – i.e, drug and alcohol pre-access and post incident testing, as well as vigilant monitoring of personnel to identify unusual or abnormal behaviour.

A network of information has been established and intelligence will flow as the project moves forward. A continual scan of conditions in the area under the auspices of a proactive intelligence gathering mechanism will be required.

Future Project security threat assessments shall be conducted periodically using a competent individual with a recognized security background to ensure potential threats and mitigating actions are undertaken, as appropriate.

6.0 Security Methodology/Approach

6.1 Muskrat Falls Generation Site

The Security Contractor's Execution Plan addresses site security methodology and approach and should be referred to for additional detail on methodology and approach. In general terms, Site Security Methodology and Approach are defined in the following sections.

6.1.1 24 Hour Patrols

Contractor employed security personnel will undertake 24 hour / 7 days a week security patrols of the site, with particular focus on conducting such patrols after normal working hours. Such patrols will be conducted by 2 person teams that will visually inspect areas containing equipment and materials, and those site support areas susceptible to unauthorized entry. Security personnel will report any unauthorized entries and persons demonstrating suspicious behaviour to project management utilizing the project reporting protocol. Additionally, Security personnel will be monitoring vehicle speed and driving activity and reporting any violations to the Emergency Response and Security Coordinator for handling..

6.1.2 Site Access and Random Checks

All authorized site personnel and contractors will be issued a readable identifcation badge which is scanned at the entry gate by site security upon entry and exit from the site. Personnel entering the site via bus or van will also be required to have their identification badges scanned prior to entry and exit from the site. The identification badge will allow for an accurate accounting of all personnel on the Muskrat Falls site at any given time during the day or night. Personnel arriving at the site without their badge may be issued a temporary identification badge after presenting appropriate identification. The temporary badgemust be returned to security upon leaving the site.

On a random basis, security checks of personnel entering and leaving the site will be conducted by the Security Contractor. Individuals who possess an unauthorized badge;

or no badge, shall be denied access to the Muskrat Falls site. An unauthorized badge may include, but is not limited to the following:

- Photograph of bearer does not match the individual trying to gain site access.
- Scan indicates expired training and/or other credentials
- Attempted access by authorized person at wrong gate
- Unauthorized contractor to the LCP
- Other circumstances- to be determined

Random checks of vehicles, knapsacks, plastic bags, luggage, tool boxes, lunch boxes, and other containers will be completed to verify that personnel are in possession of only personal property. All materials, tools or equipment may also be checked by serurity personnel. Submission to random security checks are a condition of employment on the LCP.

Reasonable suspicion of security breaches may lead to a search of an individual's site accommodations, breaches may include, but not limited to, the following:

- Theft
- Property Damage
- Suspicion of Drugs and Alcohol Possession or use/intoxication/impairment.

6.1.3 Signage

The following signage shall be posted in and around the entrances to each site:
"No Trespassing" signs, installed at all perimeter access points.

- Signs having a 24 hour emergency phone number for a person who can respond to the site. It should also be posted at each of the on-site trailers and camp facilities.
- All Signs must be posted a minimum of five feet off the ground level to prevent vandalism, sabatoge or theft.

6.1.4 Video Surveillance

Video Surveillance equipment will be strategically placed on the Muskrat Fall Generation site to continuously monitor site access points and other key areas that require continuous visual monitoring. These areas will include, but not limited to, parking areas, exterior and interior of camp facilities, and areas that contain high value equipment. Video monitoring and surveillance will be overseen and managed by contractor security personnel.

At the Accommodations Complex, twelve security cameras will be located in and around the Accommodations Complex. In addition to the security cameras, extra wiring will be provided throughout the Complex buildings area to allow for quick installation of additional security cameras as the situation dictates during occupancy. The twelve cameras noted will be located in the following areas:

- Two exterior and one interior cameras will be located in the Accommodations Complex Security Building;
- One camera will be mounted on a light standard at the Emergency Power/Fuel Storage Area;
- Two cameras will be mounted on light standards (One on north side and one on the south side of the vehicle parking area near the Accommodations Complex;
- One camera will be mounted on a light standard (along the east side) for the Bus Depot;
- One interior camera will be located in the Communications Building;
- One exterior camera will be located in the main entrance of the Accommodations Core Complex;
- One exterior camera will be located in the Transit Waiting Area of the Accommodations Core Complex;
- One interior camera will be located in the Receiving and Shipping Area of the Accommodations Core Complex;
- One interior camera will be located in the warehouse area of the Accommodations Core Complex.

(Note: These cameras will be monitored at the Main Security Building at the Accomodation Core Complex)

In addition to the above, the following exterior cameras will be located at the Security Gate near the Trans-Labrador Highway:

- Two exterior and one interior camera will be located at the Security Gate Trailer;
- Two cameras will be mounted on light standards (one on the north side with the other on the south side) for the vehicle inspection area.

(Note: These cameras will be monitored at the Security Gate Trailer)

Security cameras are also planned in the following areas:

- One security camera will be mounted on a light standard at the tapping station located on the North Spur.
- One security camera will be mounted on a light standard at the Owner's Laydown Fueling Area depot.

(Note: These cameras will be monitored at the Main Security Building at the Accomodation Core Complex)

6.1.5 Drug and Alcohol Screening Process

In accordance with the **LCP Drug and Alcohol Standard (LCP-PT-MD-0000-LR-SD-0001-01),** all project personnel and contractors will be required to undergo pre-access drug and alcohol screening. This requirement will exclude authorized visitors.

In addition to pre-acccess screening, personnel involved in an safety or operational related incident are required to undergo a post event screening to verify whether or not drug/alcohol consumption were a causal factor in the incident.

6.1.6 Vehicle Authorization

All vehicles coming to the site must meet applicable safety standards. All work related vehicles must:

- Be in a safe operating condition.
- Have funtional seatbelts that are work by all occupants of the vehicle.
- Be equipped with a 20 pound dry chemical fire extinquisher.
- Must have an adequate first aid kit.
- Must have an amber flashing beacon clearly visible and operational.
- Must have a workable and audible back-up alarm.
- Must have a flagged buggy whip
- Have no more than three people riding in the front seat.
- Not carry any personnel in the back/box.
- Be insured to Nalcor requirements.
- Have licensing and proper insurance for public roadways or will not be allowed on site.

All vehicles not meeting these requirements will not be allowed on site.

6.1.7 Public Intervention

Security personnel may be required to interact with the public at various times

Security personnel will be instructed not to respond to any questions or interact with members of the public who may arrive at the security gate. In the case that members of the public arrive at the security gate with questions related to the Project, they will be politely directed to contact the Nalcor Informatonal Office in St. John's, NL.

In the event of NGO protestors arriving at the security gate the security incident reporting protocol will be followed:

- Security, Site Personnel and/or contractor personnel will not engage with or make contact with the protesting group,
- If practical and safe and the NGO protestors are outside of the secured area the security gate will be closed and locked,
- The Nalcor/SLI Communications/Information Flow established for Incident Reporting will be utilized for and incident relating to NGO Protests, etc. In the event the condition becomes more deliberate, hazardous or personnel are endangered, all operations on the site will stop immediately and personnel will evacuate the area if it is safe to do so.
- No further actions will be taken by the site personnel without explicit instructions from either Nalcor or SLI Site management.

At no time will security personnel enter into any type of physical contact or confrontational behaviour with members of the general public. Their role is strictly to advise, observe, and report.

Should activity outside the gate (via protests or otherwise) occur, the Security Guard at the Main Gate shall contact the Muskrat Falls Site Manager immediately. The Muskrat Falls Site Manager will make contact with the RCMP (Happy Valley- Goose Bay) to respond to the site to initiate action to remove individuals from company property as the situation dictates, particularly if the intent is to cause harm, disrupt or stop work activity. As required, The Muskrat Falls Site Manager may be required to file an injunction or other legal instrument with the provincial court in order for initiate RCMP action, as and when required.

6.2 AC/DC Transmission Lines, Soldier's Pond/Churchill Falls Convertor Stations and Switchyards, Transition Compounds and Electrodes.

It is anticipated that there will be several remotely located work areas during the construction of the transmission and distribution lines. Contractor shall ensure that adequate control measures are implemented to control access to such work sites during work and after work hours. Adequate control measures shall eliminate sabotage / theft and include protection of public safety during and after work hours.

Sub Station construction at the Muskrat Falls Generation Site shall be controlled by contractor provided security personnel with project specific access control protocols followed for access and egress to the substation construction area.

Construction of sub stations at both Churchill Falls and Soldiers Pond are considered isolated work site with security and access to be controlled by the contractor. Adequate control measures shall be implemented to control access to the site during and after construction work areas. Security provisions are required to be implemented by the contractor that will include controlling public access/safety and preventing the sabotage and theft and equipment from these sites. Such provisions include, but are not limited to:

- Planned/periodic patrols around the site by sercurity services contractor personnel, particularly after work hours
- Utilization of barricading and signage at vehicle/equipment entrance points that will control access and egress to the site. Such controls will allow contractor personnel to control (i.e. screening, sign in, etc) unauthorized access to the site.

6.3 Marshalling Yards

There will be several designated Marshalling Yards for various types of equipment and materials found both on the project sites and external to the main project sites. Marshalling Yards will consist of both Contractor and Project controlled lay down areas.

Project controlled lay down areas will be adequately secured and monitored to prevent the sabotage and theft of materials and equipment. Project controlled lay downs will consist of both on site and off site areas. On site lay down areas will be afforded the security systems implied for the overall main site (i.e. gated access, security patrols, etc.). Off site project lay downs will require more detailed security planning that will require such sites to be:

- Barricaded to prevent theft and sabotage and protect public safety. Such barricading might potentially consist of fencing or some other physical means of barricading, supplemented by highly visibility signage;
- Subject to planned patrols by contract security personnel, supplemented by video surveillance & signage;
- Manned by qualified security personnel 24 hour / 7 days a week.
  Storage Containers (having at least 64 square feet of storage area) shall be equipped with the following:

- Doors shall be secured using a hasp or slide bolt with a protective device to prohibit cutting of the padlock, and attached with non-removable bolts from the exterior.
- Padlocks shall have a minimum ½ inch thick shackle with heel and toe locking.
- Exterior hinge pins shall be rendered non-removable by design or welding.

Contractor designated lay down areas shall be directly under the management and control of the contractor. The contractor shall be responsible to ensure that all necessary control measures are implemented to prevent sabotage and theft and to ensure public safety is protected.

6.4 Project Offices

Project Offices currently consist of offices in St. Johns, NL, and the Muskrat Falls Construction Site Area. All personnel working in any project office has the responsibility to understand, respect and enforce building security on a daily basis. Opportunistic theves and unsrupulous individuals often pray on those who are trusting and unaware of the security risks.

The Project Office located on Torbay Road in St. John's, NL is currently only accessible to authorized project personnel who are required to utilize an electronic swipe card for access to the building. To facilitate visitors, an administrator is positioned at the main entrance during working hours. Visitors cannot enter the building until the administrator verifies the intention of the visitor (s). As per the visitor policy, visitors are required to sign in and sign out and are to remain in the Main Entrance area until the appropriate project person arrives to meet the visitor. Visitors are to be accompanied by the respective project representative for the duration of the visit to the office.

Everyone who works in the office has the responsibility to understand, respect and enforce building security daily. Opportunistic thieves and unscrupulous individuals often pray on those who are trusting and unaware of the risks. All personnel are requested to take the following steps to maintain building security practices:

General Office Security

- All personnel are requested to visible display their ID badge for identification purposes.

- Ensure guests/visitors are checked in at the receptionist and issued a visitor's badge. If you see any individual without a badge, ask them if they can produce their badge and escort them to the receptionist if they are unable to do so.
- It is extremely important to report any suspicious unescorted person/stranger in the office at once to your manager/supervisor.
- All personnel are requested to display their Identification Badge on their person at all times. Identification Badges must not be loaned to anyone in the office. Any lost or missing ID badge must be reported to the receptionist.
- All exterior doors are provided with an alarm feature and should never be propped open at any time.
- The practices of "tailgating" (unauthorized person following closely behind an authorized ID holder) and "piggybacking" (authorized person gaining access to the building and allowing others to follow by holding open a secure door) will no longer be permitted. Signs will be posted at each door this week to remind personnel of this
- Third party visitors should sign-in with receptionist, be assigned a visitor badge and be escorted to employee contact. Visitors should be escorted back to reception, return visitor badge and sign out when finished for the day.

Personal Belongings:

- Always keep your purse, wallet, cash, credit cards or cell phone on your person or in a locked drawer at all times.
- Don't leave packages or other valuables around your desk or work area. Leave them at home or lock them up in the trunk of your car.
- Immediately report any theft or other criminal activity in the office to your supervisor.

Computer Data and Computer Generated Documents:

- Never leave confidential documents at printers or the fax machine.
- Always try to avoid leaving confidential documents in plain sight on your desktop.
- Store DVDs, USB drives and other mobile equipment under lock and key when not in use or you are away from your desk. Please be advised that USB drives used are to be the encrypted type as per Nalcor standards.
- Dispose of documents in accordance with the organization policies. Always shred confidential documents you wish to dispose of.

- It is important to Lock the keyboard (Ctrl-Alt-Del) or Windows Logo + L as soon as you leave your workstation to ensure that others cannot access your information while you are away.
- Attach and lock laptops computers with the Kensington lock at all times. If you have any questions or problems with attaching or using these locks please contact the Helpdesk for assistance.

7.0 Emergency/Incident Response

Security personnel will be involved as a key point of contact in emergency response activities, journey management and other general communications on site 24 hours per day. During evening hours, the Security Office will be the contact point for reporting any incident/ emergency. The on-duty Security Officer will be responsible for making contact with the Muskrat Falls Site Manager to initiate Emergency Response as prescribed in the ***Emergency Response Plan*****. *(LCP-PT-MD-0000-HS-PL-0004-01)*** Coordinating with the Project Security Coordinator, security personnel will potentially be required to interface with local law enforcement. Security personnel will also assist in with the incident investigation process that might include, but not limited to; securing incident scenes, accompanying and escorting personnel from the project property, etc.

8.0 Contractor Access

8.1 Site Access Control

Nalcor reserves the right to refuse access and/or entry to its premises which includes all land, property, structures and installations, vehicles and equipment owned, leased, operated or otherwise directly controlled by Nalcor, including the LCP. The construction management team will maintain control over the movements of their construction contractor and subcontractor personnel within the project work site. These measures include, but are not limited to:

- Ensuring compliance to the site specific mandatory use of personal protective Equipment.
- The construction management team shall make provisions for the transport of all construction personnel between offsite vehicle parking areas and the project site.
- Project specific badging intended to identify and allow access to authorized personnel to Muskrat Falls (see section 5.3 for specific information).

- Fences and other physical barriers around the perimeter of the project site with appropriate signage and guard stations limiting authorized/unauthorized access.
- Video cameras shall be installed at key locations throughout the site and at areas considered to be high potential for security threats.
- Limitations on the number of vehicles on project property (see section 6.12 for more specific information). Ensure that all contractor vehicles are in compliance with site requirements for obeying site speed limit requirements and backing into parking spaces.
- Random security checks on personnel and vehicles entering and leaving the Muskrat Falls Site.
- Controlled access to Sub Station Construction Sites. Access to be controlled by contractor personnel through designated access and egress points, supplemented by signage and planned security patrols
- Controlled access to designated transmission and distribution construction work areas. Physical barriers supplemented by signage to implied as control measures and be responsibility of contractor.

8.2 Public or Other Access Buildings

There will be occasions that construction activities will require workers to perform tasks that are adjacent to or directly in current operating facilities (i.e. the sub-station at Churchill Falls). Local security protocols shall be followed by all construction site personnel.

9.0 Control of Tools, Equipment & Materials

Individual contractors will be responsible for controlling and managing their equipment as it is brought onto and off the project site locations. Should overall project theft become a problem, the project will, at its discretion, implement a materials pass that will be required to remove tools and equipment from project sites.

10.0 Camera Pass

The use of cameras on site to collect personal photographs is not permitted at any Project Construction Site. Only project personnel requiring the use of a camera for project related matters are permitted to use cameras on site and must have formal

approval of the Muskrat Falls Site Manager prior to taking the pictures. If client determines that propriety or sensitive information is at risk for public disclosure, the utilization of a permitting process will be implemented.

11.0 Visitor Access

For site construction activity, the number of personnel on the construction site will generally be restricted to only those required to execute the work and manage the site. However, Visitor Access may be required on the site for business related reasons. As a result of various risks associated with Site Construction at the Muskrat Falls Site, site access will be restricted . Requirements for Construction Site Access are defined in the following document: ***Authorization Protocol for Access to Project Construction Sites.(LCP-PT-MD-0000-HS-PR-0001-01.) All personnel going to site must be familiar with this protocol prior to site entry.***

12.0 International Travel

All LCP employees travelling outside of Canada on Project related business shall comply with the requirements of the International Travel Policy. As a minimum, travellers shall:

- Complete the Security Plan Template from the International Travel Program
- Ensure travel authorization is obtained and travel is communicated to the appropriate supervisory personnel;
- Ensure that passport is current and in good, legible condition; with your number memorized and supporting documentation packed should your passport become lost or stolen;
- Ensure that all necessary health precautions are taken specific to the area you are travelling (i.e. immunizations/vaccinations) and that an adequate quantity of medication is taken with you (if applicable).
- Register with the Canadian Abroad Service, as applicable.
- Develop and keep on persons at all times, pertinent emergency numbers to call should an emergency situation arise.

13.0 Exclusions

This plan does not include supplier fabrication facilities and marine ports. Prior to the selection of other facilities and marine ports a security threat / risk assessment shall be conducted to define the level of security controls required Construction on the Transition and Electrode Sites is currently excluded from this plan. Prior to the commencement of construction at these sites a security evaluation will be facilitated by the Security Coordinator to determine the appropriate level of security services to provide and how these services will be executed.

General public areas such as airports, highways, government medical facilities shall be excluded from this plan.

TABLE of CONTENTS

1.0 PURPOSE

Nalcor Energy ("Nalcor") is the proponent of the Lower Churchill Hydroelectric Project which includes the construction of the Muskrat Falls generating facility, Muskrat Falls reservoir clearing, Muskrat Falls transmission line construction, other ancillary sites and staging areas (collectively referred to as "the Sites"). Nalcor is committed to providing a safe workplace for its employees and contractors. Industrial construction projects of this size and complexity are inherently hazardous places to work. While on the various sites, personnel will often be working in conditions and around equipment and materials that, if handled without proper care and attention, can pose a threat to the safety of those personnel and the surrounding workforce. The use of illicit drugs, inappropriate use of alcohol and the misuse of medications and other substances can have serious affects on workers' health, job safety and overall job performance through erratic behaviours and irresponsible actions. For these reasons, this Comprehensive Drug and Alcohol Standard ("Standard") has been established. This Standard recognizes the importance of an accommodation process for those persons who may have a drug or alcohol problem.

Guiding Principles

The Alcohol and Drug Standard has been developed based the following Guiding Principles:

- Nalcor is committed to providing a safe workplace for its employees and contractors;
- Recognizing the importance of an accommodation process for those persons who may have a drug or alcohol problem;
- The standard applies to all Nalcor employees, contractors, subcontractors, and their respective employees ("Workers");
- Ensuring that Workers are treated fairly and with respect;
- Workers accept responsibility for their own safety and the safety of others;
- Requiring alignment and commitment on the part of all levels of project management; and
- Zero tolerance for possession and/or use of drugs and alcohol.

2.0 SCOPE

This Standard applies to all Nalcor employees, contractors, subcontractors, and their respective employees ("Workers") working on the Sites and persons seeking a site pass required to access the various Sites ("Site Access"). The primary objectives of the Standard are to:

a) Provide safe work Sites for all Workers and personnel whose safety may be adversely affected by the conduct of other Workers; and

b) Ensure Workers are treated fairly and with respect.

We all share the responsibility to ensure that we, and the Workers around us, are all able to safely and reliably perform work duties and that everyone remains fit for duty throughout their work shift. In order to support this responsibility, Nalcor requires all contractors and subcontractors ("Contractors") to establish and fully implement their own Drug and Alcohol programs. All Contractors must commit to taking appropriate and responsible actions required maintaining a safe work place. This requires commitment on the part of all levels of project management, Contractor management, and all Workers to accept responsibility for their own safety and the safety of others. This commitment includes recognizing that conduct or behaviour off Site may adversely affect the ability to safely and reliably perform duties on the Sites. In developing this Standard, Nalcor has adopted the guidelines of the Canadian Model for Providing a Safe Workplace, Alcohol and Drug Guidelines and Rules (2010), or the most current version ("the Canadian Model"). The Canadian Model establishes a minimum industry standard for a safe workplace, is a part of an overall approach to employee health and safety. The standard provides a specific policy with respect to alcohol and drugs in the workplace and strives to establish a consistent industry practice.

As a condition of continued employment or contracting with Nalcor, employees, Contractors, and Workers must accept the terms of this Standard and comply with this Standard in their own drug and alcohol policy, which must also be at least equivalent to the requirements set out in the Canadian Model and this Standard.

This standard shall come into effect at the discretion of the Project Director, at a date no later than the commencement of work at the site.

3.0 DEFINITIONS

3.01 Zero Tolerance

Nalcor is committed to providing a safe workplace for Contractors, Workers, and persons seeking Site Access. In the interest of the safety of those persons or Workers on Site, there is zero tolerance for possession and/or use of drugs and alcohol.

a) Persons or Workers on any Nalcor Site who use or are in the possession of alcohol, illegal drugs, or illegal drug paraphernalia shall be removed from the

Sites, Site Access shall be revoked, and such persons or Workers shall be prohibited from obtaining Site Access indefinitely;

b) Persons or Workers on Sites found to be under the influence of alcohol or illegal drugs will be removed from Sites, Site Access shall be revoked, and such persons or Workers shall be prohibited from obtaining Site Access indefinitely;

c) Persons on any Site who distribute, sell, or attempt to sell drugs or illegal drug paraphernalia, or engage in unauthorized distribution, offering, or sale of prescription medications, shall be removed from such site. Site Access shall be revoked and such person or Workers shall be prohibited from obtaining Site Access indefinitely;

d) Persons or Workers on any Site under the influence of legal drugs or non-prescription medication which interfere with their judgment, coordination, or concentration are not to attend at any of the Sites and will be removed from such site. Site Access shall be revoked and such person or persons shall be prohibited from obtaining Site Access indefinitely; (in accordance with Appendix C)

e) Every person, Worker, or Contractor working on any of the Sites is required to report to the EPC/EPCM site safety personnel, EPCM site labour relations representative, the contractor, any other EPCM management person, or Nalcor, any breach of this Standard which they have observed or have been made aware of immediately, and failure to report any breach of this Standard may result in revocation of Site Access; and

f) Nalcor and/or the EPCM will not grant Site Access to any person who has tested non-negative for illegal or illicit drugs, alcohol, or any medication found to be causing impairment, as per this Standard.

3.02 Workplace Substance Abuse and Effects

Work site substance abuse is defined as:

The use of potentially impairing substances, to the point at which it has the potential to adversely affect performance and/or safety on any of the Sites.

The impairment may either be directly through intoxication and/or residual affects, or indirectly through social and/or health problems. Substance abuse is considered to occur when a drug is taken without medical reasons, or if a substance impairs and/or jeopardizes the health or safety of oneself or others. Abuse can occur by using a

substance too much, too often, for the wrong reasons, at the wrong time, or at the wrong place.

The range of substances that are abused is wide and can include (but is not limited to) alcohol, cocaine (including crack), marijuana, other illicit drugs, solvents, and misuse of prescription drugs or over-the-counter medications.

Category	Examples	Examples of General Effects
Alcohol	beer, wine, spirits	impaired judgment, slowed reflexes, impaired motor function, fatigue or drowsiness, coma, overdose may be fatal
Cannabis	marijuana, hashish	distorted sense of time, impaired memory, impaired coordination
Depressants	sleeping pills, sedatives, some tranquilizers	inattention, slowed reflexes, depression, impaired balance, drowsiness, coma, overdose may be fatal
Hallucinogens	Lysergic acid diethylamide (LSD), phencyclidine (PCP), mescaline	inattention, sensory illusions, hallucinations, disorientation, psychosis
Inhalants	hydrocarbons, solvents, gasoline	intoxication similar to alcohol, dizziness, headache
Opiates	morphine, heroin, codeine, some prescription pain medications	loss of interest, "nodding", overdose may be fatal. If used by injection, the sharing of needles may spread Hepatitis B or C and HIV/AIDS
Stimulants	cocaine, amphetamines	elevated mood, over activity, tension/anxiety, rapid heartbeat, constriction of blood vessels

3.03 Safety Sensitive Positions

The Canadian Human Rights Commission defines a Safety Sensitive Position as:

One in which incapacity due to drug or alcohol impairment could result in direct and significant risk of injury to a Worker, others, or the environment.

Whether a job can be categorized as safety sensitive must be considered within the context of the industry and the particular workplace.

All persons seeking Site Access, if granted, will be working in a safety sensitive position and accordingly, such person will submit to a drug and alcohol testing procedure.

All workers working on the Sites are considered to be working in safety sensitive positions and will submit to a drug and alcohol testing procedure, which meets this Standard in the following circumstances:

a. Where there is reasonable grounds as per this Standard; and

b. Post-incident as per this Standard.

Construction industry sites, particularly sites with this magnitude of construction work, are particularly high-risk areas. In keeping with this definition, Nalcor has identified specific duties and accountabilities as safety sensitive within the Sites, which includes, but is not limited to, the following:

a. Where the duty requires operating or working with moving machinery, equipment, tools, or mobile equipment;

b. Where the duty requires the Worker to handle hazardous chemicals (As identified by the WHMIS legislation), hazardous materials, dangerous materials, and any other materials identified as hazardous through WHMIS.

c. Where the duty requires the Worker to work in an area where blasting activities may occur;

d. Where the duty requires working knowledge of the lock-out procedures, confined space procedures, procedures for working at heights, or any other procedures required on the Sites;

e. Where the duty requires a Worker to work periodically in an area where mobile equipment or other equipment is operating, or construction activities are occurring;

f. Where the duty requires a Worker to travel in, on, or around the Sites;

g. Where the duty requires the Worker to wear personal protective equipment (e.g. hard hat, protective eyewear, safety boots, respirator, etc.);

h. Where the duty requires the Worker to work alone;

i. Where the duty requires the Worker to work above normal elevation (e.g. use of fall protection, step ladder, scaffolding, step stool, etc.);

j. Where the duty requires more than normal physical effort (e.g. lift more than 10 kg);

k. Where the Worker is responsible for the welfare and safety of others;

l. Where the Worker puts themselves or others at risk of injury or death;

m. Where the Worker can put the environment at risk placing the employer at significant liability risk; and

n. Where the duties require supervision or support of any of the above activities.

Delivery companies should be required to have alcohol and drug policies under Transportation Regulations. Any Executive personnel and other short term visitors will be made aware of the alcohol and drug policy prior to arrival at site. These personnel may, in fact, be subject to testing should circumstances dictate as referred to in this standard.

4.0 CAMP

At such time as camp rules are established, they shall be adhered to at all times.

5.0 ABBREVIATIONS AND ACRONYMS

Term	Definition
AMP	Amphetamines
BAT	Breath alcohol technician
Canadian Model	Canadian Model for providing a safe workplace, alcohol and drug guideline and rules (2010)
Certified Lab	A Lab certified by the Substance Abuse and Mental Health Services Administration

	under the National Laboratory Certification Program
COC	Cocaine
Contractors	Nalcor contractors and their subcontractors
DCR	Designated Contractor Representative
DNR	Designated Nalcor Representative
EPC	Engineering, Procurement, Construction
EPCM	Engineering, Procurement, Construction Management
MRO	Medical Review Officer
Nalcor	Nalcor Energy
NHTSA	National Highway Traffic Safety Administration
OPI	Opiates
PCP	Phencyclidine
POCT	A point of care testing procedure
Site Access	A Site pass required to access the Sites
SLI	SNC Lavalin Inc.
Standard	Comprehensive Drug and Alcohol Standard
STT	Screening test technician
THC	Marijuana
The Sites	Lower Churchill Hydro Electric Project including the construction of Muskrat Falls

	Generating Facility, Muskrat Falls Reservoir clearing, Muskrat Falls transmission line construction, other ancillary sites and staging areas.
WHMIS	Workplace Hazardous Materials Information System
Workers	Nalcor employees, contractors, subcontractors and their respective employees

7.0 RESPONSIBILITIES

Nalcor Energy LCP Safety and Health Manager

Labour Relations and Team Effectiveness Lead

8.0 TESTING PROCESS

Drug and alcohol testing as required by this Standard will be performed by an accredited drug and alcohol testing agency who will manage the process of taking test samples, having all non-negative test result samples sent for confirmation testing at a lab certified by the Substance Abuse and Mental Health Services administration under the National Laboratory Certification Program ("Certified Lab"), have the results assessed by a Medical Review Officer ("MRO") that will report non-negative test results to the Designated Contractor Representative ("DCR"), the Designated Nalcor Representative ("DNR"), and the designated EPCM Site Access Administrator ("Administrator"). This is laid out in the attached Drug and Alcohol Testing Procedures document, Appendix "A".

For reasonable grounds or post-incident drug and alcohol testing, as per this Standard, Contractors shall utilize the Sites accredited drug and alcohol testing agency. All non-negative test samples will be sent for confirmation to a Certified Lab.

The substances that will be tested for are contained in the following five panel process:

	TARGET DRUG	SCREENING CONCENTRATION	CONFIRMATION CONCENTRATION
THC	MARIJUANA	50 ng/ml	15 ng/ml
COC	COCAINE	300 ng/ml	150 ng/ml
OPI	OPIATES	2000 ng/ml	2000 ng/ml
PCP	PHENCYCLIDINE	25 ng/ml	25 ng/ml
AMP	AMPHETAMINE	1000 ng/ml	500 ng/ml

9.0 SITE ACCESS

All persons seeking site access shall undergo drug and alcohol testing as per this standard. The pre-access test must be completed before deployment on Sites and not more than thirty (30) days prior to the deployment from the Union or Contractor to the work Sites. The pre-access test will be valid for return access to Sites for

a) A period of not more than thirty (30) days from the date the test was completed. Workers or persons will be required to provide proof of a negative pre-access test to the respective Contractor for each subsequent return to Sites, or;

b) For as long as the Worker remains in continuous employment with the same Contractor. Continuous employment means without lay-off or termination of employment.

In the case of a non-negative test result for persons seeking Site Access, Site Access will not be issued to that person in the future except in accordance with Section 10, below. The DCR or DNR must inform the person of these consequences and their options, as described below. In addition to the DCR or DNR, the persons who have applied for Site Access who have tested non-negative will be provided to the Administrator and such persons will not be granted Site Access except in accordance with Section 10, below.

10.0 WAITING PERIOD FOR SECOND SITE ACCESS TEST

Site Access will not be granted to a person who has previously tested non-negative except as follows:

a) At least thirty (30) days have elapsed since the non-negative test is confirmed as per Section 9 above, such person tests negative as per Section 9 above, such person agrees to return to work terms and conditions satisfactory to the administrator, DCR and DNR, which shall include professionally or medically

directed drug and alcohol testing; which must be reported to the Administrator and the DCR and DNR and such person is cleared as fit to work on the Site safely.

b) Such person, through or by utilization of the public health care system (contact information is described below) or other means, meets all of the following conditions:

(i) The person voluntarily meets with a substance abuse professional, who will determine whether the person requires treatment for a substance abuse problem, or such person is fit to work on Sites safely.

(ii) In the case where a substance abuse professional determines if the person is fit to work on the Sites, such substance abuse professional will provide a written report containing any restrictions, return to work conditions, and confirmation that the person is fit to work on the Sites safely to the Administrator and the DCR or the DNR. The report of the substance abuse professional must be in a form satisfactory to the Administrator, DCR and/or the DNR. Such person may be subject to a Return to Work Agreement in a form satisfactory to the Administrator, the DCR, or the DNR, which shall be based on the recommendations of the substance abuse professional in consultation with the Administrator, the DCR and/or the DNR, and which may include professionally or medically directed drug and alcohol testing.

(iii) In the case where a substance abuse professional determines the person has a substance abuse problem and requires treatment, such person shall provide to the Administrator and the DCR or DNR written confirmation from a substance abuse professional in a form satisfactory to the Administrator and the DCR or DNR when an assessment and/or treatment has been successfully completed, this report must contain any recommendations, work restrictions, and confirmation that the person is fit to work on Sites safely. Such a person who has successfully completed an assessment and/or treatment must sign a Return to Work Agreement in a form satisfactory to the Administrator and the DCR or DNR, which shall be based on the recommendations of the substance abuse professional in consultation with the Administrator, the DCR and/or the DNR, which may include professionally or medically directed drug and alcohol testing.

(iv) The person must execute a Substance Abuse Professional Release of Confidential Information, attached as Appendix "B".

(v) The person must test negative as per Section 8 above and this must be reported to the Administrator and the DCR or DNR.

10.01 Providing Substance Abuse Support Information and Accommodation

The DCR or DNR must inform a person who has tested non-negative that if the person wishes to use the option to seek help and support, the Newfoundland and Labrador public health care system provides many options for support, which are covered by Medicare, such as outpatient counselling, adult residential treatment, detoxification services, and more. The DCR or DNR must tell the person that detailed information on services can be obtained online at http://www.health.gov.nl.ca/health/commhlth_old/factlist/services_available.htm and by phoning 1-888-737-4668.

10.02 Confidentiality of Substance Abuse Professional Information

In order to preserve the confidentiality of information provided by a substance abuse professional, the Administrator, the DCR or DNR, and any person to whom disclosure is permitted under this Standard, must not disclose the information to any person other than a person who is required to know the test results to discharge an obligation under this Standard.

10.03 Testing Non-Negative More Than Once For Site Access

In the event that any person tests non-negative more than once when seeking Site Access, such person shall be prohibited from obtaining Site Access indefinitely.

11.0 REASONABLE GROUNDS TESTING

a) In any situation when a Worker at work or within two hours prior to reporting to work appears, or is reported by another Worker to appear to be unfit for work, a supervisor or manager of that Worker must investigate the situation. If they, in consultation with the next level of management, (both levels must sign off) conclude there are reasonable grounds to believe the Worker is under the influence of drugs or alcohol, or that drugs or alcohol may be a contributing factor to the Workers condition, the Worker will be requested to submit to a drug and alcohol test. Factors to consider in deciding if reasonable grounds for testing exist include, but are not limited to:

(i) The odour of alcohol and/or drugs detected on the Worker;

(ii) The observed use of a substance by the Worker;

(iii) Where the Worker's appearance, and/or performance, and/or behaviour strongly suggests that the individual is under the influence of drugs or alcohol; and

(iv) Where, after a fit for work assessment performed by a supervisor, the supervisor believes the Worker may be under the influence of drugs or alcohol.

b) A supervisor or manager of a Worker must provide the Worker with the reasons for requesting a drug and alcohol test, and those reasons must be documented. Documentation should include a reasonable grounds checklist, a copy of which is attached as Appendix "C".

c) Tests are to be conducted as soon as reasonably practicable following a reasonable grounds determination.

d) Where testing occurs more than four (4) hours from the time of the determination, the Contractor must provide to Nalcor or the designate of Nalcor, in writing, a reason for the delay.

12.0 POST-INCIDENT TESTING

a) A supervisor or manager of a Worker must request the Worker to submit to a drug and alcohol test if the supervisor or manager and the next level of management present on the Worksite, have reasonable grounds to believe that the Worker was involved in a safety related incident, a significant near miss incident, which under different circumstances could have caused serious injury or property damage or other potentially dangerous incident/activity. The supervisor should request that the worker stop all work related activities prior to testing for reasonable grounds.

b) Workers referred for drug and alcohol testing will also include those who are identified, with reasonable grounds, as having been directly involved in the chain of acts or omissions leading up to the event or incident.

c) A drug and alcohol test is automatic after a significant incident, unless there is clear evidence that the acts or omissions of Worker(s) could not have been a contributing factor (e.g. structural or mechanical failure). A significant incident would include but not be limited to the following:

(i) A fatality or serious personal injury to any person;

(ii) An environmental spill with significant implications;

(iii) Significant loss or damage to any property, equipment, or vehicles;

(iv) Significant financial loss; or

(v) A near-miss incident that had the potential for significant damage, or environmental harm.

d) In any situation, whether the incident is significant or not, reasonable grounds testing may occur, subject to 11.0.

e) Workers must not use alcohol for eight hours after the incident or until drug and alcohol testing has occurred, or the Worker is advised a test is not required.

13.0 TESTING REQUEST

The supervisor or manager must request that all workers concerned submit to drug and alcohol testing immediately in the event of reasonable grounds, or immediately following a significant accident, near miss, or other potentially dangerous incident, but if it is not practicable or reasonable to do so until a later time, collection shall not occur more than 8 hours after the incident for an alcohol test, and 32 hours after the incident for a drug test. Until the test is completed the employee shall remain in the care of his/her manager/supervisor and transferred to a medical professional during actual treatment for an incident.

14.0 FAIL TO TEST

Any Worker who fails to comply with a testing request, or delays a test pursuant to this Standard, or refuses to provide a sample for a test, will be considered to be in breach of this Standard and such Worker will be removed from the Sites, have their Site Access revoked, and shall be prohibited from obtaining Site Access indefinitely. If an attempt to tamper with a test sample is confirmed, the employer of such Worker shall remove such Worker from the Sites, shall not deploy such Worker to the Sites thereafter, and such Worker shall be prohibited from obtaining Site Access indefinitely.

15.0 POTENTIAL RETURN TO SITE AND REASONABLE GROUNDS POST-INCIDENT

Any Worker denied access to the Sites due to the results of drug and alcohol testing for reasonable grounds or post-incident may, subject to Nalcor's (EPCM) approval and the Contractor's approval, be permitted Site Access subject to the following conditions:

a) The Worker voluntarily meets with a substance abuse professional, who will make a determination whether the Worker requires treatment for a substance abuse problem or such Worker does not have a substance abuse problem. If the substance abuse professional determines that the individual does not have a substance abuse problem or is a recreational drug or alcohol user, such individual shall not be permitted site access unless Nalcor's (EPCM) determines there are exceptional circumstances that warrant considering such individual be granted site access and such individual meets the conditions set out in Section 15 (b), (c), (d), and (e) below.

b) In the case where a substance abuse professional determines the Worker is fit to work on the Sites, such substance abuse professional will provide a written report containing any restrictions, return to work conditions, and confirmation that the Worker is fit to work on the Sites safely to the Administrator and the DCR or the DNR. The report of the substance abuse professional must be in a form satisfactory to the Administrator, DCR and/or the DNR. Such Worker may be subject to a Return to Work Agreement in a form satisfactory to the Administrator and the DCR and/or the DNR, which shall be based on the recommendations of the substance abuse professional in consultation with the Administrator and the DCR and/or the DNR, and which may include professionally or medically directed drug and alcohol testing.

c) In the case where a substance abuse professional determines the Worker has a substance abuse problem and requires treatment, such Worker shall provide to the Administrator and the DCR or DNR written confirmation from a substance abuse professional in a form satisfactory to the Administrator and the DCR or DNR when an assessment and/or treatment has been successfully completed. This report must contain any recommendations, work restrictions and confirmation that the Worker is fit to work on Sites safely. Such Worker who has successfully completed an assessment and/or treatment must sign a Return to Work Agreement in a form satisfactory to the Administrator and the DCR or DNR, which shall be based on the recommendations of the substance abuse professional in consultation with the Administrator and the DCR and/or the DNR, which may include professionally or medically directed drug and alcohol testing.

d) The Worker must execute a Substance Abuse Professional Release of Confidential Information, attached as Appendix "B".

e) The worker must test negative as per Section 8 above, and this must be reported to the Administrator and the DCR or DNR.

15.01 Providing Substance Abuse Support Information and Accommodation

The DCR or DNR must inform a Worker who has tested non-negative that if the Worker wishes to use the option to seek help and support, the Newfoundland and Labrador public health care system provides many options for support, which are covered by Medicare, such as outpatient counseling, adult residential treatment, detoxification services, and more. The DCR or DNR must tell the Worker that detailed information on services can be obtained online at http://www.health.gov.nl.ca/health/commhlth_old/factlist/services_available.htm and by phoning 1-888-737-4668.

15.02 Confidentiality of Substance Abuse Professional Information

In order to preserve the confidentiality of information provided by a substance abuse professional, the Administrator, the DCR or DNR, and any Worker to whom disclosure is permitted under this standard, must not disclose the information to any Worker other than a Worker who needs to know the test results to discharge an obligation under this Standard or except as required by law.

15.03 Testing Non-Negative More Than Once

In the event that any Worker tests non-negative more than once, such Worker shall be prohibited from obtaining Site Access indefinitely.

16.0 CONSEQUENCES OF NON-COMPLIANCE WITH THIS STANDARD

Non-compliance by a Worker with this Standard will result in Site Access being temporarily revoked until the investigation of the reasons for non-compliance and the incident, including tests and results in a final determination of corrective action. Workers, who are found in non-compliance with this Standard may be removed from Sites and have their Site Access revoked by Nalcor or Nalcor's designate and may be prohibited from obtaining Site Access indefinitely. Persons who are found to be in non-compliance of this standard may be subject to discipline up to and including termination by the Contractor.

17.0 ALCOHOL AND DRUG TESTING REPORTS

The Contractors and each accredited drug and alcohol testing agency shall maintain the following:

a) A report from each accredited drug and alcohol testing agency used by the Contractor that specifies the number of drug and alcohol tests performed, the number of positive or non-negative tests by each type of test requirement, and the number of tampered specimens. Test requirement types include those for pre-access, reasonable grounds, and post-incident. This report shall be provided by the EPCM to Nalcor quarterly or more often if required by Nalcor.

b) Each Contractor shall maintain a report which identifies the total number of persons or Workers who have tested non-negative by specific trade, the number of persons or Workers tested by specific trade, but shall not provide the names of persons or Workers. A copy of this report shall be provided in hard copy and electronically by the Contractor to Nalcor quarterly or more often if required by Nalcor.

18.0 PROOF OF COMPLIANCE

Nalcor shall have the right to request proof of compliance to this Standard at any time.

19.0 SEARCH AND SEIZURE – POSSESSION OF DRUG AND ALCOHOL PARAPHERNALIA

Nalcor or its designate reserves the right to investigate, and/or require the Contractor or subcontractors to investigate, any situation when there are reasonable grounds to believe that alcohol, illicit drugs, or illicit drug paraphernalia are present on Site, in violation of this Standard or the Sites rules.

Nalcor or its designate, Contractors or subcontractors and their Workers are responsible for identifying situations where a search and seizure may be reasonable. Reasonable may be based on a combination of indicators which may include behaviour, odour, information received, or presence of paraphernalia. The supervisors will be responsible for advising their manager of the situation, who, in conjunction with onsite security, onsite Health and Safety Management (or their designates), and local police authorities, where appropriate, will make the decision as to whether or not to initiate a search.

On the Sites, Nalcor or Nalcor's designate may, for reasonable grounds, have Nalcor's supervision or the supervision of Nalcor's designate, Contractor supervisors and/or authorized search and inspection specialists, including scent-trained animals, conduct unannounced searches and inspections of Contractors, subcontractors, and/or Workers and their property. Property may include, but not limited to wallets, purses, lockers, baggage, offices, desks, tool boxes, clothing and vehicles. Where practical, such searches shall be in the presence of the affected Worker.

All Nalcor employees, contractors, sub-contractors and visitors and their property may be subject to search and seizure on arrival and departure from the Sites.

Seizure and future control of any alcohol, drugs, or drug paraphernalia will be directed by the Security personnel.

Nalcor or Nalcor's designate, along with Contractor management (if Contractor personnel involved) may determine whether law enforcement agencies will be contacted.

In the event any Nalcor employee, contractor, sub-contractor and visitor refuses to submit to a search or is believed to be in violation of this Standard as a result of a search, such Worker or person's Site Access will be temporarily revoked until an investigation of the refusal to submit to a search or violation of the Standard is completed. Workers or persons who are found in non-compliance with this Standard may be removed from Sites, have their Site Access revoked by Nalcor or its designate and may be prohibited from obtaining Site Access indefinitely. Persons found in violation of this Standard may be subject to discipline up to and including termination by the Contractor.

20.0 ATTACHMENTS/APPENDICES

Appendix A – Drug and Alcohol Testing Procedures
Appendix B – Substance Abuse Professional Release of Confidential Information
Appendix C – Reasonable Grounds Checklist

APPENDIX "A"
Drug and Alcohol Testing Procedures

The following procedures are a general overview only. More detailed information may be obtained from the approved accredited drug and alcohol testing agency. As an alternative to the drug and alcohol testing procedure contained herein, the approved accredited drug and alcohol testing agency may utilize a point of care testing procedure commonly referred to as a quick test ("POCT"). In the case of POCT, all non-negative tests must be confirmed by a Certified Lab.

I. Alcohol testing

General

1. The donor is the person or Worker from whom a breath or saliva sample is collected.

2. The donor is directed to go to a collection site in order to give a breath or saliva sample.

3. The breath alcohol technician ("BAT") or the screening test technician ("STT") as appropriate establishes the identity of the donor. Photo identification is preferable. Positive identification by a Contractor or company representative who holds a supervisory position is acceptable.

4. The BAT or STT as appropriate explains the testing procedure to the donor.

5. The Contractor or company must securely store information about alcohol test results to ensure that disclosure to unauthorized persons does not occur.

6. Breath testing and saliva testing devices are used to conduct alcohol screening tests and must be listed on the National Highway Traffic Safety Administrations ("NHTSA") conforming products list.

Breath testing

1. The BAT and the donor complete those parts of the alcohol testing form that is to be completed before the donor provides a breath sample.

2. The BAT opens an individually wrapped or a sealed mouthpiece in the presence of the donor and attaches it to the breath testing device in the prescribed manner.

3. The BAT explains to the donor how to provide a breath sample and asks the donor to provide a breath sample.

4. The BAT reads the test result and ensures that the test result is recorded on the alcohol testing form after showing the results to the donor.

5. The BAT completes the part of the alcohol testing form that is to be completed after the donor provides a breath sample and asks the donor to do so as well.

6. If the test result shows an alcohol level that is less than 0.020 grams/210 litres of breath, the BAT informs the donor that there is no need to conduct any further testing and reports the result in a confidential manner to the DCR or DNR. While the initial communication need not be in writing, the BAT must subsequently provide a written report of the test results to the DCR or DNR.

7. If the test result shows an alcohol level that is equal to or greater than 0.020 grams/210 litres of breath, the BAT informs the donor of the need to conduct a confirmation test.

Saliva testing

1. The STT and the donor complete those parts of the alcohol testing form that are to be completed before the donor provides a sample.

2. The STT checks the expiration date of the saliva testing device shows the date to the person or Worker and uses a saliva testing device only if the expiration date has not passed.

3. The STT opens an individually wrapped or a sealed package containing the saliva testing device in the presence of the donor.

4. The STT invites the donor to insert the saliva testing device into the donor's mouth for the time it takes to secure a proper specimen. If the donor does not wish to do this, the collection site person offers to do so.

5. The STT reads the result the saliva testing device produces and records the test result on the alcohol testing form after showing the results to the donor.

6. The STT completes the part of the alcohol testing form that is to be completed after the donor provides a saliva sample and asks the donor to do so as well.

7. If the test result shows an alcohol level that is less than 0.020 grams of alcohol in 100 millilitres of saliva or an equivalent concentration in other units, the STT informs the donor that there is no need to conduct any further testing and

reports the result in a confidential manner to the DCR or DNR. While the initial communication need not be in writing, the STT must subsequently provide a written report of the test results to the DCR or DNR.

8. If the test result shows an alcohol level that is equal to or greater than 0.020 grams of alcohol in 100 millilitres of saliva or an equivalent concentration in other units, the STT informs the donor of the need to conduct a confirmation test.

Confirmation test

1. If a breath alcohol testing device was used for the screening test, an evidential breath alcohol device must be used to conduct the alcohol confirmation test. If a saliva testing device was used for the screening test, the confirmation test will use an evidential breath alcohol testing device.

2. The BAT advises the donor not to eat, drink, put anything into his or her mouth or belch before the confirmation test is complete.

3. The confirmation test must start not less than fifteen minutes after the completion of the screening test and not more than thirty minutes after the completion of the screening test.

4. The BAT and the donor complete those parts of the alcohol testing form that are to be completed before the donor provides a breath sample.

5. The BAT opens a new individually wrapped or sealed mouthpiece in the presence of the donor and inserts it into the breath testing device in the prescribed manner.

6. The BAT explains to the donor how to provide a breath sample and asks the donor to provide a breath sample.

7. The BAT reads the test result on the device and shows the donor the result displayed. If the confirmation test result is equal to or in excess of 0.040 grams per 210 litres of breath, the BAT will do an external calibration check (accuracy check) to ensure the device is in working order. The BAT ensures that the test result is recorded on the alcohol testing form. The BAT verifies the printed results with the donor.

8. The BAT completes the part of the alcohol testing form that is to be completed after the donor provides a breath sample and asks the donor to do so as well.

9. The BAT immediately reports in a confidential manner the test results to the Administrator, DCR or DNR. While the initial communication need not be in writing, the BAT must subsequently provide a written report of the test results to the Administrator, DCR or DNR.

II. Drug testing

1. The donor is the person or Worker from whom a urine specimen is collected.

2. The donor is directed to go to a collection site in order to give a urine specimen.

3. The collection site person must establish the identity of the donor. Photo identification is preferable. Positive identification by a Contractor or company representative who holds a supervisory position is acceptable.

4. The donor must remove coveralls, jacket, coat, hat or any other outer clothing and leave these garments and any briefcase or purse with the collection site person.

5. The donor must remove any items from his or her pockets and allow the collection site person to inspect them to determine that no items are present which could be used to adulterate a specimen.

6. The donor must give up possession of any item which could be used to adulterate a specimen to the collection site person until the donor has completed the testing process.

7. The collection site person may set a reasonable time limit for providing a urine specimen.

8. The collection site person selects or allows the donor to select an individually wrapped or sealed specimen container. Either the collection site person or the donor, in the presence of the other, must unwrap or break the seal of the specimen container.

9. The donor may provide his or her urine specimen in private, in most circumstances. The specimen must contain at least forty-five millilitres.

10. The collection site person notes on the chain of custody form any unusual donor behaviour.

11. The collection site person determines the volume and temperature of the urine in the specimen container.

12. The collection site person inspects the specimen and notes on the chain of custody form any unusual findings. If the temperature of the specimen is outside the acceptable range or there is evidence that the specimen has been tampered with, the donor must provide another specimen under direct observation by the collection site person or another person if the collection site person is not the same gender as the donor.

13. The collection site person splits the urine specimen into two specimen bottles. One bottle is the primary specimen and the other is the split specimen.

14. The collection site person places a tamper-evident bottle seal on each of the specimen bottles and writes the date on the tamper-evident seals.

15. The donor must initial the tamper-evident bottle seals to certify that the bottles contain the urine specimen the donor provided.

16. The donor and the collection site person complete the chain of custody form and seal the specimen bottles and the laboratory copy of the chain of custody form in a plastic bag.

17. The collection site personnel arrange to ship the two specimen bottles to the laboratory as quickly as possible.

18. The laboratory must be the holder of a certificate issued by the Substance Abuse and Mental Health Services Administration of the United States Department of Health and Human Services under the National Laboratory Certification Program.

19. The laboratory must use chain of custody procedures to maintain control and accountability of urine specimens at all times.

20. Laboratory personnel inspect each package for evidence of possible tampering and note evidence of tampering on the specimen forms.

21. Laboratory personnel conduct validity testing to determine whether certain adulterants or foreign substances were added to the urine specimen.

22. Laboratory personnel conduct an initial screening test on the primary specimen for the drugs set out in Section 8 of the Standard using established immunoassay procedures. No further testing is conducted if the initial screening test produces a negative test result.

23. Laboratory personnel conduct a confirmatory test on specimens identified as positive by the initial screening test. The confirmatory test uses gas chromatography/mass spectrometry.

24. A certifying scientist reviews the test results before certifying the results as an accurate report.

25. The laboratory reports the test results on the primary specimen to the MRO in confidence.

26. The MRO, if satisfied that there is no legitimate medical explanation for a non-negative test result, will inform the Administrator, DCR or DNR in a confidential written report that a person tested positive. Prior to making a final decision on whether a test result is non-negative, the MRO must give the person an opportunity to discuss the results. The MRO shall report to the DCR or DNR whether the test result is negative, tampered, invalid or positive, or, if positive, whether or not there is a legitimate medical explanation. The MRO shall also report to the Administrator when the test is tampered, invalid or positive.

27. A person or Worker who has received notice from the MRO that he or she has tested non-negative may ask the MRO within 72 hours of receiving notice that he or she has tested positive to direct another laboratory to test the split specimen. The person or Worker is responsible for reimbursing the Contractor or company for the cost of the second test.

28. The laboratory reports the test results on the split specimen to the MRO in confidence.

29. The MRO will declare the test results negative if the test results for the split specimen are negative and the failure to reconfirm is not due to the presence of an interfering substance or adulterant.

APPENDIX "B"
SUBSTANCE ABUSE PROFESSIONAL
RELEASE OF CONFIDENTIAL INFORMATION

I (Person or Worker), _____, give permission to _____ to contact:
_____ (Name) _____ (Substance Abuse Professional Name)

TO

Name:	Insert Name		**Name:**	Insert Name	
Organization:	Insert Name		**Organization:**	Contractor/Employer Name	
Title:	Insert Name		**Title:**	Insert Title	
Address:	Address	**Province:** NL	**Address:**	Address	**Province:** NL

WHAT INFO

To release verbally or in writing:

☒	Assessment	☒	Participation
☒	Attendance	☒	Program Dates
☒	Relevant History	☒	Progress Summary
☒	End-Summary & Recommended Actions	☒	Reason for Referral
☐	Other:	☒	Treatment Plan

PURPOSE

The information I have consented to for purpose of disclosure shall only be used for the following reasons:

- To enable the Contractor to develop a return to work plan aimed at assisting me to obtain Site Access and completing and maintaining rehabilitation while working on the Site.
- To assist Nalcor and the Contractor to determine whether or not I should be granted Site Access or my Site Access should be revoked.

CONSENT

I understand that provision of treatment services is not dependent upon my decision to release information and that I may cancel this consent at any time. I also understand that some action may have been taken prior to cancellation.

Person or Worker

Signature:_____
Witness: _____
Date Signed: **YYYY/MMM/DD**
Permission will Expire on: YYYY/MMM/DD

CANCEL

I, _____, cancel this permission. I understand that some action may have been taken prior to this cancellation.

Signature:_____
Witness: _____
Date Signed: **YYYY/MMM/DD**

APPENDIX "C"
REASONABLE GROUNDS CHECKLIST

Worker's Name: _____

Date: _____

Workplace/Project Name: _____

ID/Brass Number: _____

Put check marks against the phrases that best describe this worker's behaviour. **Add as much information as you can** that may assist in clarifying the situation, as well as any witnesses to the behaviour you are describing.

	Date(s)	Explanation
1. General Appearance □ Sleepy □ Tremors □ Other (specify)		
2. Workplace Behaviour □ Interrupts others work □ Inflexible about procedures □ Argumentative □ Inappropriate emotional outbursts □ Physically threatening □ Alcohol or drug consumption observed		
3. Temperament at Work □ Withdrawn much more than usual □ Easily upset by everyday events □ Agitated and on edge □ Excessively worried or fearful □ Extreme variations of mood		
4. Job Performance □ Forgets instructions, abnormal □ Procedures □ Works abnormally slowly □ Erratic productivity		

	Date(s)	Explanation
□ Missed deadlines □ Signs of intoxication (smell of alcohol or drugs, slurred speech, confusion, inarticulate speech, uncoordinated) □ Poor judgment □ Fails to wear safety equipment □ Other (specify)		
5. Relationship with co-workers □ Abnormal reaction to criticism □ Imagines criticism where there is none □ Complaint received from co-worker □ Complaint from client		
6. Absenteeism □ Excessive absence □ Unlikely excuses for absence □ Excuse for absence proven false □ Absences follow a pattern □ Frequently late returning from breaks □ Excessive absence from workstation		
7. Further observations or comments:		

Names of management or supervisory personnel trained in the Comprehensive Drug and Alcohol Work Standard or contractors policy who have completed this checklist:

Do Reasonable Grounds for testing exist? ☐ Yes ☐ No If No, explain above in section #7.

Supervision:_____

TABLE of CONTENTS

1.0 Purpose

This document defines the coding formats and associated component codes to be utilized on the Nalcor Energy – Lower Churchill Project. NE-LCP will provide identification of information, activities and asset elements. The intent is to provide coding direction that will facilitate consistent capture, tracking and reporting throughout the life cycle of the asset.

2.0 Scope

The coding described in this document shall apply to all coding of revision controlled documents pertaining to NE-LCP.

3.0 Definitions

Coding Format: A combination of component codes that when logically presented together provide unique identification for a piece of information, an activity or an asset element.

Component Codes: The codes utilized to construct intelligent coding formats.

Engineering/Design Document: Document (including drawings) created to capture the conception, analysis, construction/fabrication, commissioning and/or ongoing maintenance criteria required to build, operate and/or maintain a physical product or electronic system.

Supplier Document: A document created in support of the manufacture preservation, installation, commissioning, operation and ongoing maintenance of purchased equipment.

Contractor Document: Document deliverables resulting from a service related contractual relationship.

Information Set: A named collection of interrelated data grouped together due to commonalities.

Management System Document: Document created to define and/or support a function or process. (Ie. policies, strategies, standards, procedures, etc.) Document belonging to Management System.

Metadata: Electronic Properties or Attribution used to describe the particulars of a document, drawing or other data.

Originator: The person determining a specific code to be used to uniquely identify a piece of information, activity or asset element.

Originator Code: The organization creating the document to which the code applies.

Revision Controlled Document: A document subject to revision in a "controlled" fashion through a review or approval process.

Structured Data: Information that resides in fixed fields within an electronic environment. The content in the fields of databases and spreadsheets are examples of structured data.

Unstructured Data: Information that is represented as free-form text, image or graphics which can be treated as a unit. A text document or a drawing would be examples of unstructured data.

4.0 Abbreviations and Acronyms

EDMS – Electronic Document Management System
LCPDCC - Lower Churchill Project Document Control Center
NE-LCP – Nalcor Energy – Lower Churchill Project
WBS – Work Breakdown Structure

5.0 Reference Documents

LCP-PT-MD-0000-PC-LS-0001-01 – *Project Work Breakdown Structure and Code of Accounts*
LCP-PT-MD-0000-IM-PR-0008-01 – *Directions to Contractors / Suppliers for Document Requirements*

6.0 Responsibilities

NE-LCP Information Management Group: As custodians of this document, shall be responsible for coordinating the creation, implementation, maintenance and distribution of this coding standard.

Originator: As the use of this document is mandatory, originators of documents and data are responsible to comply with the coding described for the creation and ongoing maintenance of all information, activities and asset elements.

7.0 Specific Field Input Directions

It is the goal of the NE-LCP to realize efficiencies by having consistent capture, tracking and reporting of project information, activities and asset elements. Standard coding is key to achieving this goal.

All information, activities and asset elements will require project codes that will be captured on documents and/or within electronic systems used to manage the Project.

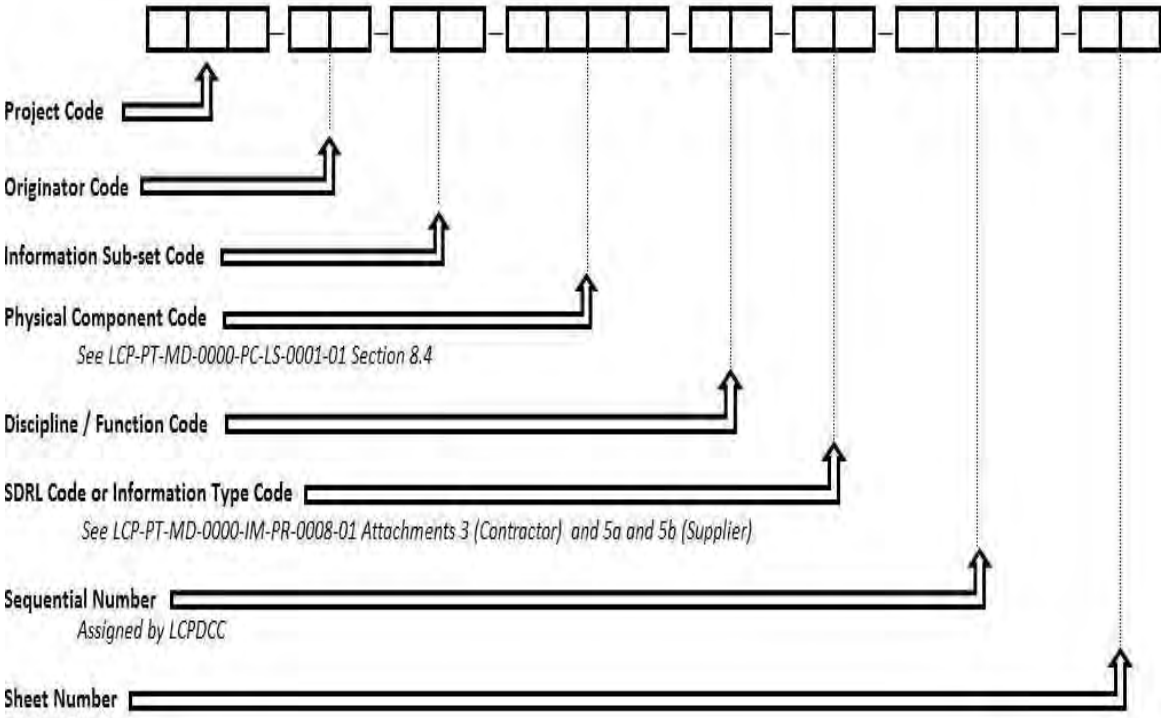
7.1 Document (Unstructured Data) Coding

Revision controlled documents are dynamic documents (including drawings) which are subject to revision control and that are required to go through a review or approval process. Revision controlled documents typically include Engineering/Design, Construction, Fabrication, Contractor and Management documentation.

The NE-LCP document number shall be applied to all LCP revision controlled documents and drawings and shall also be the reference document / drawing number when referring to other LCP revision controlled documents/drawings.

Intelligent document numbering is being implemented as shown in Figure 1.

Figure 1: Nalcor Energy – Lower Churchill Project Document Number Structure.



Document Format Sample:

Project Code:	LCP – Lower Churchill Project
Originator Code:	PT – Project Management Team
Information Sub-Set Codes:	ED – Engineering Drawing
Physical Component Codes:	1111 – Access Roads – Construction/Temporary
Discipline/Function Codes:	AR – Architectural
Information Type Code:	GA – General Arrangement
Sequence:	0001
Sheet Number:	01

Project Document Number: LCP-PT-ED-1111-AR-GA-0001-01

Note: When document numbers are being listed in a register/spreadsheet type format, dashes are to be used between each component without leaving spaces.

Component Code Descriptions:

Project Code: Three character alpha code, denoting project area to which the document pertains. (Included to provide potential for future use of this document coding structure by other areas of the parent organization and still maintain uniqueness in numbering.)

Project Code

LCP – General
GIL – Generation – Gull Island
MFA – Generation – Muskrat Falls
ILK – Island Link
MLK – Maritime Link
ETM – Export Transmission

Originator Code: Two character alpha code, denoting the specific part of the organization creating the document. It ***does not*** denote responsibility for design. Also, although inclusion of code may not provide full asset life-cycle value for identification purposes, it is included in document number to alleviate potential duplicate numbering across the project's multi-group document creation environment. Originator Codes are assigned by the NE-LCP Information Management Group upon Contract Award.

Information Sub-Set: Two character alpha code, denoting the *general* information set to which the document being created.

Information Sub-Set Codes

ED – Engineering / Design Document
MD – Management System Document
CD - Contractor Document
SD – Supplier Document

Physical Component: Four digit numeric code, denoting the structure/major work component of the asset to which the document relates, based on Work Breakdown Structure (WBS) as captured in project document LCP-PT-MD-0000-PC-LS-0001-01 - Project Work Breakdown Structure and Code of Accounts. For documents not related to a specific component (such as project management procedures) or for documents which relate to more than one component, use the code "0000".

Discipline/Function: Two character alpha code, denoting the Engineering Discipline or Project Functional group responsible for the creation of the document and to which the information contained in the document relates. See below list of accepted Discipline/functional codes.

Discipline/Function Code

AB - ABORIGINAL AFFAIRS
AD - ADMINISTRATION
AM - ASSET MANAGEMENT
AR - ARCHITECTURAL
CA - CONTRACT ADMINISTRATION
CM - COMMISSIONING
CO - COMMUNICATIONS
CS - CONSTRUCTION
CT - CERTIFICATION
CV - CIVIL (Including - Hydraulics)
DR - DRILLING
EA - ENVIRONMENTAL ASSESSMENT
EL - ELECTRICAL
EN - ENGINEERING (GENERAL)
EP - ESTIMATING & PLANNING
EV - ENVIRONMENT
FI - FINANCE AND ACCOUNTING
GT - GEOTECHNICAL

HR - HUMAN RESOURCES
HS - HEALTH, SAFETY & SECURITY
IB - INDUSTRIAL BENEFITS
IE - INVESTMENT EVALUATION
IM - INFORMATION MANAGEMENT
IN - INSPECTION
IS - INFORMATION SYSTEMS
LC - LOSS CONTROL
LE - LEGAL
LR - LABOUR RELATIONS
MA - MARKET ACCESS
ME - MECHANICAL (Including - HVAC, Piping & Hydraulics
MM - MATERIALS MANAGEMENT
MR - MARINE
MT - MAINTENANCE
OP - OPERATIONS
PC - PROJECT CONTROLS
PI - PIPING
PM - PROJECT MANAGEMENT
PO - PROCUREMENT
PP - PROPERTIES
PR - PUBLIC RELATIONS
PS - POWER SALES
PT - PROTECTION AND CONTROL
QA - QUALITY ASSURANCE
QC - QUALITY CONTROL
QM - QUALITY MANAGEMENT
RI - RISK MANAGEMENT
RT - REGULATORY
SC - SUPPLY CHAIN
SM - STAKEHOLDER MANAGEMENT
SS - SUBSEA
ST - STRUCTURAL
SU - SUB SURFACE

Information Type: Two character numeric code, denoting *specific* type of document being created.

Sequence Number: Four digit numeric code, denoting the sequence number unique to the specific prefixing document code combination. Starts at 001 each time any component of the prefix coding changes. (Assigned by Document Control - LCPDCC.)

Sheet Number: Two digit number, starting at 01. Used only for drawings. This will facilitate revision of individual documents without having to revise the associated sheets.

7.1.1 Revision Status Codes

Changes to a revision controlled document must be identified as a revision change. All documents must indicate the purpose for which it was issued, and the number of times it has been issued for that specific purpose.

Each document shall have a two character/digit alpha numeric code, comprised of the status and revision codes, applied to indicate each issue of the document.

Revision Status Code: Single character alpha code indicating the purpose for which the document was issued by the Originator. See table below for details.

Revision Status:
A - IDC - Issued for Review
B - Approved for Use / Implementation / Bid
C - Approved for Purchase /Construction / Fabrication
D - Approved for Design
L - As-built
N - Cancelled
S - Superseded
V - Void

7.2 Supplier / Contractor Coding

There are a number of contractual type documents. Documents produced as deliverables for a contract will follow the engineering/revision controlled number format.

The contract number will be cross referenced in the EDMS system in the Contract Number attribute ensuring the information is easily identified to a particular Contract or Supplier Package.

Format:

Supplier Document Coding Format Sample:

Project Code:	**MFA – Muskrat Falls**
Originator Code:	**XY – XYZ Inc.**
Information Sub-Set Code:	**SD – Supplier Document**
Physical Component:	**1550 – Buildings – Warehousing**
Discipline/Function Code:	**ST – Structural**
SDRL Code:	**B01 – General Arrangement**
Sequence:	**0001**
Sheet Number:	**01**

Project Document Number: MFA-XY-SD-1550-ST-B01-0001-01

Note: Although Contractual documents are subject to review and acceptance, the revision history for Supplier Documentation shall be maintained using an amendment process, sequential numbering per submission. A status and revision code will not be applied.

Code of Conduct and Business Ethics Handbook

nalcor energy

Vision

Our vision is to build a strong economic future for successive generations of Newfoundlanders and Labradorians.

Values

At Nalcor Energy, our employees share a set of values that shape how we do business every day. Our core values set common direction on how to make decisions with a sense of pride and leadership. We recognize that it is not only what we achieve, but how we achieve it that truly makes us proud of our accomplishments.

Open Communication – Fostering an environment where information moves freely in a timely manner.

Accountability – Holding ourselves responsible for our actions and performance.

Safety – Relentless commitment to protecting ourselves, our colleagues and our community.

Honest and Trust – Being sincere in everything we say and do.

Teamwork – Sharing our ideas in an open and supportive manner to achieve excellence.

Respect and Dignity – Appreciating the individuality of others by our words and actions.

Leadership – Empowering individuals to help guide and inspire others.

Table of Contents

As President and CEO of Nalcor Energy, one of my most important duties is to ensure a work environment based on trust and respect, which enables employees to work without fear of intimidation, discrimination and retaliation. Enjoying our jobs is the first step. However, all of us should also have the comfort of knowing we work in a safe, secure and ethical workplace. Only then can we all feel proud to work here, feel good about our jobs, and work productively. Every person, regardless of position, shares in the responsibility for promoting a positive work environment.

To support this type of workplace, the Board of Directors adopted the *Code of Business Conduct and Ethics* (Code) for employees of all Nalcor Energy companies to reinforce the company's commitment to professional and ethical business practices. Nalcor Energy is growing and employees are increasingly dealing with more sensitive information. This Code provides general guidance and principles for the more complex business reality. The purpose of this policy is to provide guidelines on conflict of interest and ethical business practices and conduct and to promote expected standards of conduct. It also provides general guidance on how to avoid and report potential conflicts of interest and unethical business conduct.

This code links together many existing policies and legislation like our harassment policy, conflict of interest and Occupational Health and Safety legislation. It also addresses Nalcor's safety programs like the Internal Responsibility System. The content of the Code should be familiar to you. You'll also notice, the Code is supported by our values: accountability, respect and dignity, safety, leadership, teamwork, open communications and honesty and trust.

Nalcor is committed to professional and ethical business practices. As you review the Code, if you have any questions or concerns, please take the opportunity to discuss these with your manager or feel free to contact me as well. Your cooperation is essential to ensure that we maintain a positive, productive workplace.

Regards,

Ed

Ed Martin
President and CEO

1. What the Code Means to Nalcor Employees

Our organizational goals are what define Nalcor Energy as a company dedicated to safety, the environment, business excellence, our people and our community. To ensure all Nalcor Energy companies meet our goals, we must practice the highest standards of business conduct and ethics.

This handbook should be used as a guide to practice responsible and ethical behaviour. The complete Code outlines Nalcor's commitment to professional and ethical business practices, and can be found in the policies and procedures section of the GRID. The Code defines the standards of conduct expected of our employees at all Nalcor Energy companies – including any contractors, suppliers, agents, officers or directors and anyone else who may represent the views or interests of our company.

Everyday, in everything we do, we must behave ethically, honestly and with credibility. When we apply this Code to the work we do, we become an organization that is a corporate leader not only in Newfoundland and Labrador, but around the world.

2. Purpose and Responsibilities

The Code identifies a standard for all our employees to follow when confronted with a situation that may cause us to question our ethics and principles at work. The Code defines what Nalcor considers conflicts of interest and potential conflicts of interest, as well as unethical business practices and conduct. Guidance is also provided through the Code to handle, and avoid, these situations all together.

When we follow the values and spirit of this Code, we ensure Nalcor is an organization with a reputation of integrity and sound business practices and conduct.

We all carry an individual responsibility to apply the principles of the Code to our work. The Code explains what accountabilities exist for Nalcor employees, Supervisors and Managers.

Employees

The first responsibility for Nalcor employees is to ensure we read and understand the Code. Following that, as employees, we must always conduct ourselves in a manner that reflects the principles of ethical behaviour, and avoid situations which may present a conflict of interest.

To protect the reputation of our company, employees have a responsibility to ensure everyone we work with complies with the standards and requirements of the Code. To respect our colleagues, customers, and Shareholder, we have a duty to immediately disclose any situation that may go against the principles or spirit of the Code.

Supervisors and Managers

Supervisors and Managers should always demonstrate the principles of the Code. Our Supervisors and Managers must be aware of any conduct that contradicts the Code and follow proper procedure to manage any issue. You also have a responsibility to provide guidance to employees about the Code, and address any concerns employees may raise about ethics and conduct in the workplace. Supervisors and Managers must also ensure that all Nalcor employees are provided with a copy of the Code and understand its requirements.

3. Key Principles

Four key principles guide how we should apply the Code in our day-to-day work. By understanding and following these principles, we can ensure respectable and consistent behaviour across the company.

- The commercial, reputational and other interests of Nalcor Energy must always take precedence over personal interests and those of third parties.
- We must always avoid any act or conduct – intentional or not – that may support the private interests of a third party or an individual over those of Nalcor Energy.
- Any conflict of interest – real or perceived – has the potential to impair the company's credibility, reputation and commercial interests.
- We have an obligation to perform our duties and responsibilities in a conscientious manner, and never allow our personal interests to conflict with Nalcor's.

All parties with whom we conduct business have the right to expect the highest standards of respect, professionalism and business ethics in their dealings with us.

We must demonstrate our commitment to business conduct and ethics in every interaction with our external stakeholders. Customers, suppliers, partners, competitors, shareholder representatives and regulators are among the external stakeholders with whom we regularly carry out business.

We are guided by our organizational values in the things we do and the decisions we make.

We must consider Nalcor's organizational values, standards and principles whenever we represent the company. Nalcor is committed to being an ethical and honest organization, this commitment should be considered in all Nalcor's strategies, plans and decisions.

4. Standards of Business Conduct

The Standards of Business Conduct is the corporate commitment to comply with applicable laws and established sound corporate business standards and practices. When our company fails to meet these standards, we risk damaging our reputation.

Compliance with Laws

In addition to following the Code and other corporate policy and procedures, all Nalcor Energy employees must comply with the applicable laws and regulations of the provinces and countries where we operate. Nalcor employees must never engage in, condone, or encourage any behaviour that is illegal or is not compliant with the Code. We all have an individual responsibility to understand the laws that apply to our work, recognize potential noncompliance and know when to ask for help to report on activity that is illegal or is contrary to the Code.

Safety and Health

Nalcor is committed to being a safety leader. This means ensuring we implement effective safety policies and procedures. To be a safety leader, we must also ensure organization-wide compliance with all applicable laws and standards to protect the health, safety and well being of our employees, contractors, customers and the public.

Employees must take all steps required to work safely. We all have a duty to support a working environment without injury and to foster a culture where everyone is committed to safety.

When working with each other or external parties, we must observe and actively promote Nalcor's core safety rules, which are central to our safety credo.

1. I always follow safety requirements and best practices.
2. I always take the time to complete my work safely.
3. I always take action when I see unsafe acts or conditions.

Environmental Protection

Being an environmental leader is an important goal for Nalcor Energy. Our *Environmental Policy and Guiding Principles* ensures the company sustains a diverse and healthy environment now and in the future. Nalcor's environmental principles maintain a high standard of environmental responsibility and performance. To ensure our environment is sustainable, we should all take time to understand our environmental policy and our commitment to meet and exceed environmental laws and regulations. Nalcor is working to prevent pollution and continually improve our own environmental performance. The goal of environmental protection cannot be achieved without the support and dedication of our employees and contractors.

If you observe someone endangering the environment, your legal and ethical responsibility is to report the situation to a Supervisor. When we take time to work in an environmentally-responsible manner and report environmental non-compliance, we ensure Nalcor builds its reputation as a company with sound environmental principles and actions.

5. Respecting Each Other

Each and every Nalcor employee contributes to the success of our company. We must respect one another and value each other for the different perspectives and experiences we all bring to the company. Mutual respect across divisions and lines of business will result in collaboration and new ideas to ensure Nalcor not only grows, but flourishes into the future and we achieve our vision.

Respect and Dignity

Nalcor employees deserve to work in an environment where they are treated fairly and with respect. We must all take steps to ensure we are respectful of others, supportive of the dignity and self-esteem of every person and promote an environment that is free of harassment. The importance of treating each other with respect applies to all Nalcor employees, regardless of their role or position.

Behaviours considered disrespectful and not supported by Nalcor include:

Harassment – Any behaviour directed at a person that is unwelcome and/or offensive will not be tolerated. Examples of behaviour that is considered harassment includes:

- threats
- unwelcome remarks
- derogatory comments or innuendo which may humiliate, insult or intimidate a person
- personal or sexual harassment
- abuse of authority
- any other conduct which denies a person their dignity and respect in any other way

Discrimination – We all deserve, and should expect, a workplace free of discrimination. Discrimination can be based on an individual's race, religion, religious creed, political opinion, color or ethic, national or social origin, sex, sexual orientation, marital or family status, physical or mental disability or age. The Newfoundland and Labrador Human Rights Code and the Canadian Charter of Rights and Freedoms provide basic protections against discrimination. We are all expected to apply those same standards in all our interactions as Nalcor employees.

Personal dignity and mutual respect – We are all responsible to encourage a work environment where a diversity of views, opinions and backgrounds is valued. The diversity of views and opinions of employees is a key factor in Nalcor's vitality and success. Any behaviour which denies individuals their dignity and respect is out-of-line with the Code, and the company's organizational values and principles, and will not be tolerated.

Offensive material – The posting or use of offensive, sexist, sexually explicit, racist or other discriminatory material in the work environment is never acceptable. At Nalcor, the work environment is considered the physical location where an employee performs their duties. Offensive material is prohibited on all Nalcor equipment and property, including its e-mail and intranet/internet systems and any other location that offends others.

> "The importance of treating each other with respect applies to all Nalcor employees, regardless of their role or position."

6. Protecting Our Business

Nalcor Energy's vision is to build a strong economic future for successive generations of Newfoundlanders and Labradorians. We are all responsible to contribute to the company's mandate to lead the development of the province's energy resources. To be successful, elements of Nalcor's business must be valued and protected. To protect the company and our stakeholders, we must ensure the effective management of our corporate assets, financial information and respect confidentiality and privacy requirements.

Protection of Corporate Assets

Nalcor Energy has an internal system of controls, policies and procedures designed to prevent fraud, misappropriation and other financial irregularities. To ensure the system is effective, we must all make an effort to protect Nalcor's assets against loss, damage, unauthorized use, theft and disposal. Assets may be tangible, including facilities, equipment, supplies, vehicles and property, or intangible, such as intellectual property, trade secrets and customer, business and confidential data and information.

Unless information has been produced specifically for external consumption, all Nalcor information – including records, data, project specifications and plans and processes, policies and procedures – are considered proprietary corporate information and must not be shared without proper authorization.

When circumstances arise where it is advisable or required for employees to share confidential information with external parties, we must work with management to ensure all parties must agree to, and sign, a Non-Disclosure Agreement. At any time that a contract or employment with Nalcor ends, any information or documents related to the company must also be returned.

Privacy and Confidentiality

Protecting the privacy and confidentiality of personal, business, employee, customer and contractor information is critical to maintaining Nalcor's credibility. We must all be diligent about protecting the privacy and confidentiality of our colleagues, our Shareholder, partners and customers. As a general rule, confidential information should never be released to external parties unless required by law or authorized by the affected party. To ensure we comply with privacy requirements, we should always appropriately secure any information considered confidential.

Nalcor employees who utilize the company's electronic databases or mail systems should familiarize themselves with the corporate policies and procedures regarding the storage, use and transmission of all confidential information.

Financial Information

Nalcor is dedicated to maintaining a reputation of being a financially accountable organization. All of the company's financial information, data and records are accurate, reliable, factual and complete, and are retained to meet the requirements of applicable laws and standards. Nalcor discloses its financial information in compliance with Canadian generally accepted accounting principles and all applicable laws. The company also makes full, accurate and plain disclosure in any report provided to regulatory authorities.

Security and Emergency Measures

The protection of life and property at Nalcor is committed through the development and implementation of corporate security and emergency measures, policies and processes. An example of security measures at Nalcor is the requirement for visitors to be made aware of facility safety policies and procedures.

Intellectual Property

In the performance of their duties and responsibilities, Nalcor Energy representatives may develop an innovative product that is tangible or intangible – known as intellectual property. All employees must understand that any intellectual property created while an individual is employed by, or on contract with Nalcor, belongs to the company. Because intellectual property is owned by Nalcor, the company has the rights to the intellectual property, unless otherwise authorized.

Competitors

Nalcor Energy will never support any information gathering on a competitor that is illegal or unethical. Anytime a Nalcor employee gathers information about a competitor, it must be done in a manner that is both legal and ethical. Employees should never directly or indirectly solicit proprietary or confidential information about competitors. Information that may be considered proprietary or confidential must never be solicited from any colleague who may have once worked for, or who is currently employed by, a competitor.

> Nalcor Energy will never support any information gathering on a competitor that is illegal or unethical.

7. Conflict of Interest

At all times, employees must avoid any conflict of interest – potential or real. Agents of the Province of Newfoundland and Labrador, including Nalcor and Newfoundland and Labrador Hydro, are governed by the Conflict of Interest Act (Act). Although not all Nalcor Energy lines of business are considered Crown corporations, this Code requires that all employees comply with the spirit and intent of the Act. The Act outlines responsibilities and behaviours we should always practice to avoid any potential conflict of interest. Any employee of an outside organization or contractor working with Nalcor must also follow the spirit and intent of the Act.

We should consider the implications of an activity that adversely affects, or could affect, our performance as a Nalcor employee to be a potential conflict of interest. Employees should refrain from any activity that could offer a personal advantage because of their employment at Nalcor.

Avoiding Conflict of Interest

To avoid any potential conflict of interest, we should exercise best personal judgment at all times. If there is any question if a situation could be a conflict, it is recommended to disclose the matter to a Supervisor or Manager. Guidelines are offered in the Code to help avoid conflict of interest.

Tips to avoid conflict of interest

- Do not participate in making a decision where there may be an opportunity to improperly benefit an individual or family member – directly or indirectly.
- We are not to use our positions to influence decisions that could result in a personal benefit for ourselves or family members.
- Confidential information that is not available to the general public cannot be used for personal gain, or the benefit of family members or anyone else.
- Other than compensation provided by Nalcor, we must never accept a fee, gift or personal benefit, unless a gift is given as a matter of business custom. Cash gifts are never acceptable.
- Employees must not let offers of future employment influence their duties or decisions as a Nalcor representative.
- Insider trading is the buying and selling of securities on the basis of insider knowledge – this means knowledge that is not available to the public. Any Nalcor employee who violates provincial or Canadian insider trading laws will be subject to both legal penalties and termination of employment.
- Price-fixing, bid-rigging, kickbacks or any other similar activity related to competitions are never acceptable. Any employee who engages in these sort of activities will be subject to immediate termination and any applicable legal recourse.
- Nalcor Employees cannot personally enter a contract with an outside company or vendor, except under the following circumstances:
  - the contract existed before the individual became a Nalcor employee
  - the contract was awarded by public tender
  - the contract was made in an emergency
  - the contract is for goods and services which cannot be provided by any other vendor
  - the individual is an employee of Churchill Falls (Labrador) Corporation Limited, and the circumstances of the contract fall under the provisions of Site Administration Regulation No. 5.6

Entertainment, Gifts and Favours

When we accept any sort of invitation, gift or other benefit, we must be mindful to avoid any situation that could be perceived as a conflict of interest. Gifts may only be accepted as a gesture of appreciation, hospitality or civility and be part of routine business relationships. Gifts and benefits should never be accepted if preferential treatment could be perceived.

Business meals and entertainment are acceptable when they are consistent with accepted business practices. They should only be accepted to further normal business relations, and should never be extravagant. All business meals or entertainment, received or provided, must be approved by a Supervisor or Manager.

> “Employees are always expected to exercise good judgement in evaluating a donor’s reason or reasons for offering a gift.”

Gifts must never be accepted when the offering party is in a Request for Proposal or contractor selection process with Nalcor, or if the party has a relationship with a bid or another company making a bid.

Nominal Value

When accepting any gift, entertainment or other favour, the value of the gift must not exceed $150 CDN. If a gift is offered above this value, the gift must be disclosed to a Supervisor or Manager.

A Supervisor or Manager may approve the acceptance of any such offer when circumstances justify it as an appropriate gesture of appreciation, hospitality or civility. When receiving an offer above the acceptable nominal value, alternatives such as donating the gift to a charitable organization or sharing the benefit with the department rather than an individual should be considered.

Employee Judgement

Employees are always expected to exercise good judgement in evaluating a donor’s reason or reasons for offering a gift. Prior to accepting a gift, we should always consider the effect a gift may have on our actions and how others may perceive the gift. If there are any questions or doubts about whether a gift, entertainment or other benefit should be accepted, the gift should be politely refused.

Outside Business Interests

Any outside business interest should never interfere with our employment at Nalcor. To ensure we always influence our best judgement as Nalcor employees, employees cannot be employed by an outside business during the employee's regular working hours for Nalcor. The company's real property, intellectual property, equipment or supplies must also never be used for outside business purposes.

To avoid any perception of conflict of interest, employees cannot promote or advertise outside business interests to co-workers during work hours. Employees should not be contacted at Nalcor offices by customers or partners outside of the employee's role at Nalcor.

Outside companies in which a Nalcor employee has an interest cannot enter into a contract with Nalcor unless the following provisions are met:

a) the shareholding or interest of the employee is 10 per cent or less; or,

b) Nalcor's Chief Executive Officer (CEO) agrees the employee is not in a position to influence the awarding of the contract, and that there is no conflict with the individual's public duties; or,

c) the CEO decides the employee's shareholding or interest in the outside company will not interfere with the individual's duties and responsibilities as a Nalcor representative; or

d) the CEO is satisfied that the employee's shareholding or interest has been placed in a trust which will prevent the individual from exercising authority or control over the affairs of the outside corporation or partnership.

Disclosure

Whenever we find ourselves in a situation we reasonably believe is, or could be, a potential conflict of interest, we must disclose the nature of the conflict to our Supervisor, Manager or Vice President. After a conflict has been disclosed, we must immediately remove ourselves from the situation.

COLLECTIVE AGREEMENT

Between

Muskrat Falls Employers' Association Inc.

and

Resource Development Trades Council

of Newfoundland and Labrador

for the Construction of

The Lower Churchill Hydroelectric Generation Project

At Muskrat Falls on the Lower Churchill River

Newfoundland and Labrador

Revision 2

May 2012 – 2017

TABLE OF CONTENTS

Article 1 Purpose

1.01 The purpose of this Special Project Collective Agreement ("Agreement") is to establish certain terms and conditions of employment for workers employed by Contractors for the construction of the Lower Churchill Hydroelectric Generation Project ("Project"). The Parties jointly recognize that this is Newfoundland and Labrador's Project and is of immense importance to the Provincial Energy Plan in bringing clean, renewable energy to Atlantic Canada, under the following common vision.

"Our vision is to build a strong economic future for successive generations of Newfoundlanders and Labradorians."

1.02 The Parties agree to work collaboratively, to support positive labour relations and ensure that issues are dealt with in a timely manner. This Agreement will facilitate the Parties' relentless commitment to safety, a respectful work environment, positive labour relations and high productivity.

1.03 This Agreement will facilitate the participation of qualified Labrador Innu, residents of Newfoundland and Labrador, women and members of other disadvantaged groups.

1.04 This Agreement and its constituent Trade Appendices, Recitals, Schedules, Letters of Understanding and Memoranda of Agreement shall constitute a Collective Agreement for the purposes of a Special Project Order to be declared under Section 70 of the Labour Relations Act when executed by the Parties and shall be administered as such. The terms of this Agreement, including all Trade Appendices, Recitals, Schedules, Letters of Understanding and Memoranda of Agreement shall take precedence over any existing or future union contracts or agreements entered into by any union. In the event that a conflict exists between Article 1 to Article 38 of this Agreement and the Trade Appendices, Recitals, Schedules, Letters of Understanding and Memoranda of Agreement ("Supplementary Attachments") to this Agreement, the applicable Article in the Agreement shall prevail.

Article 2 Parties

2.01 The Parties to this Agreement shall be those listed in Articles 2.01(a), 2.01(b) and those Unions listed in Article 2.01(b) (i) to (xvii) that negotiate a Trade Appendix as per Article 2.01(2) below.

a) Muskrat Falls Employers' Association Inc.

b) Resource Development Trades Council of Newfoundland and Labrador on behalf of the following signatory departments and unions:

i) The Canadian Office of the Building and Construction Trades Department, AFL-CIO

ii) United Brotherhood of Carpenters and Joiners of America and Carpenters Local Union 579

iii) International Association of Bridge, Structural, Ornamental and Reinforcing Ironworkers and Local Union 764

iv) Labourers' International Union of North America and the Construction and General Labourers' Union, Rock and Tunnel Workers Local 1208

v) International Union of Operating Engineers and Local Union 904

vi) The International Brotherhood of Teamsters and Local Union 855

vii) Hotel Employees and Restaurant Employees International Union and Local Union 779

viii) International Association of Heat and Frost Insulators and Allied Workers, Local Union 137

ix) International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers, and Helpers and Local Union 203

x) International Union of Bricklayers and Allied Craftsworkers and Local Union 1

xi) Brotherhood of Carpenters and Joiners of America and Millwrights Local Union 1009

xii) International Union of Painters and Allied Trades and Local Union 1984

xiii) United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the U.S. and Canada, and Local Union 740

xiv) Sheet Metal Workers' International Association and Local Union 512

xv) International Brotherhood of Electrical Workers and Local Union 2330

xvi) International Brotherhood of Electrical Workers and Local Union 1620

xvii) International Union of Elevator Constructors and Local Union 125 A

c) Any Union listed in Article 2.01(b) may become a signatory to this Agreement subject to negotiating a Trade Appendix. The financial parameters of such Trade Appendix shall not be the subject of negotiations as all financial terms and conditions will be contained in the main body of the Agreement, with the exception of premiums that are Trade-specific.

Article 3 Definitions

3.01 The following definitions apply to this Agreement:

a) "Association" means the Muskrat Falls Employers' Association Inc. representing Contractors performing Special Project work at the Site.

b) "Benefits Strategy" means Lower Churchill Construction Project Benefits Strategy as established or may be amended from time to time by the Government of Newfoundland and Labrador.

c) "Commissioning" includes work required to calibrate and test equipment, processes, systems and/or facilities prior to turning a piece of equipment or a portion of the plant over to the operations team responsible for start-up and operating the plant.

d) "Contractor" or "Employer" means any Contractor engaged by the Owner or any subcontractor engaged by the Owner or the EPCM on behalf of the Owner, or any subcontractor engaged by a Contractor, to carry out Special Project work at the Site, but does not include the Owner or the Owner's agent or EPCM carrying out engineering, purchasing and construction management work.

e) "Council of Unions" means the Resource Development Trades Council of Newfoundland and Labrador comprised of trade unions as listed in Article 2 of this Agreement.

f) "EPCM" means the Owner's Engineering Procurement Construction Management Company(s) as may be designated from time to time.

g) "Labrador Resident" means a Canadian or landed immigrant who has his/her principal residence in Labrador or meets the requirement of the Elections Act, 1991, S.N.L. 1992 c. E-3.1 as amended from time to time. Factors and/or current documents to be examined when determining who is a resident may include property tax assessment, lease agreement, driver's licence, vehicle registration, income tax returns, voter's list registration or MCP number.

h) "Lower Churchill Project" or "Project" means Special Project work performed for Contractors by employees represented by the Council of Unions at the Site for the purpose of constructing hydroelectric generating installations and related facilities for the Project in the Province of Newfoundland and Labrador.

i) "Owner" means Nalcor Energy or any successor or nominee entity.

j) "Party" or "Parties" means the Party or Parties to this Agreement, namely the Association and the Council of Unions.

k) "Principal Residence" means the place where the worker maintains a self-contained domestic establishment where he/she ordinarily resides; that is, a dwelling, house or similar place of residence where a person generally eats and sleeps.

l) "Provincial Resident" means a Canadian or landed immigrant who has his/her principal residence in Newfoundland or Labrador or meets the requirement of the Elections Act, 1991, S.N.L. 1992 c. E-3.1 as amended from time to time. Factors and/or current documents to be examined when determining who is a resident may include property tax assessment, lease agreement, driver's licence, vehicle registration, income tax returns, voter's list registration or MCP number.

m) "Site" means the geographical description and/or scope of work described on Schedule "A".

n) "Special Project Work" means special project work as defined by the *Labour Relations Act* of Newfoundland and Labrador as amended from time to time.

o) "TFW" means temporary foreign workers, being workers or prospective workers who are not citizens or permanent residents of Canada.

p) "Work" means construction work as defined under the *Labour Relations Act* of Newfoundland and Labrador for the Lower Churchill Hydroelectric Generation Project carried out for contractors at the site by workers represented by the Union.

q) "Work Schedule" means the repetitive cycle of scheduled work days and of scheduled days of rest to which a worker may be assigned by the Contractor.

Article 4 Scope and Recognition

4.01 The Association hereby recognizes the Council of Unions as the sole and exclusive bargaining agent for the Union employees of the Contractors as described in the classifications set out in the Trade Appendices attached hereto as [Schedule "D"] engaged in construction work at the Site. The Council of Unions shall represent its member Unions and all employees within the scope of this Agreement in all matters relative to this Agreement.

4.02 The Council of Unions hereby recognizes the Association as the sole and exclusive bargaining agent for all Contractors engaged in the construction of the Lower Churchill Project at the Site. All Contractors engaged in construction of the Lower Churchill Project at the Site and having employees working within the scope of this Agreement shall be required, as a condition of contract award, to become members of the Association and to observe the terms and conditions of this Agreement.

4.03 This Agreement is limited to the Site, designated offsite quarries and transport of these aggregate and till materials between designated quarries and the Site. Commitments under this Agreement do not in any way create bargaining rights or obligations for Contractor employees not on the Site, nor shall such commitments be the basis of support for creation of rights or obligations off the Site.

4.04 This Agreement does not apply to:

a) Construction Trades Supervisors above the rank of General Foreperson, those employees excluded under the *Labour Relations Act* of Newfoundland and Labrador, office staff employed in a confidential capacity relating to labour relations, engineering, technical and drafting personnel, lab technicians, and quality control and visual inspectors excepting those normally employed by the Quality Control Council of Canada as is set out in the appendices attached hereto of the International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers, and Helpers and Local Union 203 and the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the U.S. and Canada Local Union 740.

b) This Agreement does not apply to any scope of work which falls under a different special project order issued pursuant to Section 70 of the *Labour Relations Act* as referenced in Schedule “A.2”.

4.05 It is understood and agreed by the Parties hereto that no bargaining relationship is created or will be created at any time during the term of this Agreement or any extension of the term of this Agreement between the Owner. or the Owner's Engineering Procurement Construction Management ("EPCM"), or their subsidiaries and affiliates and their successors (unless such subsidiaries, affiliates or successors of the EPCM directly hire members of the Council of Unions to work on the Site in which case this Agreement shall apply) and a local union, the Council of Unions, or any affiliate of the Council of Unions, by voluntary recognition or by action of law pursuant to the *Labour Relations Act* of the Province of Newfoundland and Labrador or by any other means. Accordingly this Agreement does not apply to the Owner or EPCM, their subsidiaries, affiliates and their successors or to the employees of any of the aforementioned. .Accordingly, an arbitrator shall have no authority or jurisdiction to make any order or award any remedy against the Owner or the EPCM, their successors, affiliate and their successors or to any employees of the aforementioned, save and except where those employees have been hired directly by the EPCM as is provided for above.

4.06 The Association shall designate, in writing, one or more Site representatives with full authority to administer the terms of this Agreement. The Council of Unions agrees to recognize said representatives and their authority to carry out those duties. There shall be at least one Association Site Representative as an ex-officio member of all joint committees. Should the Association change any of its designated Site representatives, it shall inform the Council of Unions of such change in writing.

4.07 The Council of Unions shall designate one or more Site representatives, in writing, with full authority to administer the terms of this Agreement. The Association agrees to recognize said representatives and their authority to carry out their duties. There shall be at least one Council of Unions Site Representative as an ex officio member of all joint committees. Should the Council of Unions change any of its designated Site representatives, it shall inform the Association of such change in writing. The Council of Unions shall be provided an appropriate office at the Site to be shared by the Council of Unions’ Site Representative(s).

4.08 The Association, the Contractor(s), the Council of Unions, the Union(s) and employee(s) shall not seek to agree, or agree on any matter, within the scope of this Agreement or as to the interpretation of this Agreement or application of this Agreement except as provided in this Article. Only the Association and the Council of Unions may, by written agreement signed by the duly authorized representative of each Party, amend the terms of this Agreement or enter into any agreement as to the interpretation or application of this Agreement. This Article does not extend to the exercise of practical labour relations between the Contractor(s) and the Council of Unions on a day-to-day basis provided that the exercise of practical labour relations does not contravene this Article or Agreement.

4.09 The Unions who are members of the Council of Unions jointly and severally agree with the Association and with each other to maintain the Council of Unions and they hereby delegate to the Council of Unions their rights as bargaining agents for all members of their respective Unions who come within the scope of this Agreement, and they agree during the term thereof, not to seek to bargain individually with the Association or any Contractor and to be governed exclusively by the terms of this Agreement and by all lawful settlements of disputes, grievances and differences made pursuant to the terms of this Agreement.

4.10 The Parties agree that the Innu Liaison position is not a representative of the Union, Contractors, or Association and is not included in the bargaining unit.

Article 5 Management Rights

5.01 The Contractors retain full and exclusive authority for the management of their business and to exercise such rights, subject to the provisions of this Agreement. In addition to the rights of the Contractors set forth in this Agreement, the Contractors shall retain all rights of management.

5.02 Without restricting the generality of the foregoing, it is agreed that it is the exclusive function of the Contractors:

a) to determine qualifications, skills, abilities and competency of employees;

b) to determine workforce requirements, including the required number of employees;

c) to hire, transfer, select, assign work, monitor and manage productivity, promote, demote, lay off, discipline and discharge employees for just cause and to increase or decrease the workforce from time to time;

d) to determine job content, materials to be used, design of products, facilities and equipment required, to prescribe tools, methods of performing work and the location of equipment, the location work is to occur and the scheduling of work; and

e) to establish, implement, monitor and enforce policies, procedures, rules, regulations and standards to be observed by employees, and non-compliance

may involve discipline, including dismissal, which discipline or dismissal is subject to the grievance and arbitration process under this Agreement.

5.03 This Article is subject to the grievance and arbitration process as per Article 15.01 of this Agreement.

Article 6 Union Security

6.01 The Contractor shall not discriminate against any employee by reason of membership in a Union;

a) Every worker who is a member or becomes a member of a Union shall maintain his/her membership in a Union as a condition of employment;

b) Every new worker, including, but not limited to, Labrador Innu, residents of Labrador, residents of the Province and TFWs, shall be given the option to make application to become a member in a Union; however, they are required to pay union dues and assessments as a condition of employment;

c) The deductions for union dues, field dues, initiation fees, permit fees and/or all other assessments shall be authorized by any worker covered by this Agreement. Any worker who refuses or neglects to sign the appropriate forms or who revokes the authorization or who resigns membership in the Union will be deemed to have forfeited his/her right for employment on the Project and will be deemed to have voluntarily resigned; and

d) A person shall be deemed to be in good standing with the Union for the purposes of compliance with Article 6.01(c) above if he/she has paid the one time permit fee. The person shall authorize deduction of union dues and assessments notwithstanding the fact that that person has not joined the Union.

6.02 The Contractor agrees to deduct monthly union dues from all employees covered by this Agreement as a condition of employment. Union dues as defined herein shall include field dues or permit fees if applicable. When remitting union dues, the Contractor shall provide the names, SIN and classification of the employees from whose pay such deductions have been made.

6.03 The Contractor further agrees to deduct from all employees such union dues, assessments and/or all initiation fees as evidenced by a signed authorization from employees and to forward such monies to the appropriate Unions as provided for in Article 6.04.

6.04 The Contractor shall deduct, as notified by the Union, such union dues or back dues from the employee's first paycheque of each month and/or if applicable, from the employee's final paycheque upon termination and forward such monies on or before the fifteenth (15th) day of the following month to the appropriate Union.

6.05 Initiation fees or permit fees will be deducted from an employee's pay in equal amounts over a period of three (3) pay periods, or such longer time as directed by the Union. Initiation fees, union dues, assessments, permit fees and other fees or costs related to the Union must be reasonable and will be no more than the average charged by other affiliated unions in other areas of Canada.

6.06 Qualified Newfoundlanders and Labradorians or other qualified persons have the option to make application for membership to the appropriate Union that such person has the necessary qualifications to join. Access to Union membership for such non-union members will be enabled through the ongoing and expeditious review of membership, which shall occur at least monthly.

6.07 International representatives, Union managers or agents, designated in writing by the Council of Unions, may have access to Site, subject to Site policies, procedures, standards or regulations applicable to the Site. Prior arrangements for access to Site will be made with the Council of Unions Site Representative through the Association Site Representative, and in no case shall such visit interfere with the progress of work. The Association shall be given reasonable notice of a Site visit.

Article 7 Hiring Provisions

7.01 The Parties agree that creating a sustainable and flexible workforce will benefit the Council of Unions and ensure there is a significant workforce in Newfoundland and Labrador with the ability to obtain workers from Atlantic Canada and other parts of Canada to support Project construction

7.02 The Parties agree to ensure compliance with the Gender Equity and Diversity obligations regarding hiring of females and persons from underrepresented groups as specified by the Benefits Strategy or any employment equity plan that may be applicable to the hiring of qualified Labrador Innu, to be hired or referred in the following order of priority:

i) Qualified Labrador Innu;

ii) Qualified residents of Labrador; and

iii) Qualified residents of Newfoundland.

7.03 In order to meet the obligations applicable to the hiring and retention of qualified Labrador Innu and obligations contained within the Benefits Strategy, the Parties agree that all Project partners, including the Association, its Contractor members, the Council of Unions and its Union members will work proactively and progressively to advance the participation and integration in the areas of employment, training and apprenticeship for all employees/groups under Article 7.02 above.

7.04 After employment priority is given with the obligations contained in Articles 7.02 and 7.03, the Parties are committed to work cooperatively to identify, recruit, refer and hire workers in the following order of priority:

a) Qualified Canadian workers who are members of affiliated Unions;

b) Qualified Canadian workers;

c) Qualified legal residents of the United States of America, who are members of Unions affiliated with the Council of Unions and who are authorized to enter and work in Canada; and

d) Other qualified non-Canadian workers who are authorized to enter and work in Canada.

7.05 The Parties agree that should Temporary Foreign Workers be required for employment on the Project, the following will apply:

a) Temporary Foreign Workers employed by Contractor(s) on Site shall be permitted mobility from one Contractor on Site to another Contractor on Site should another Contractor on Site require the services of such Temporary Foreign Worker, provided there are no qualified Newfoundland and Labradorian workers or qualified Canadian workers available at the time of hire or transfer.

b) Temporary Foreign Workers, if required, will be initially accessed from affiliate American unions, and if such unions cannot supply Temporary Foreign Workers in a reasonable timeframe, such Temporary Foreign Workers may then be accessed from other sources.

c) Temporary Foreign Workers will be subject to the same financial package and other terms and conditions of this Agreement as Newfoundland and Labrador workers, with the exception of, if necessary, adjustment to the financial allocation of benefits, provided there is no change to the gross hourly package. Such adjustments shall be agreed upon with the applicable Local Union, and such Local Union will not unreasonably withhold their consent.

7.06 The Council of Unions and member Unions will fully cooperate in the Temporary Foreign Worker application process, including the execution of any documents that are reasonably necessary to support an application for utilization of Temporary Foreign Workers to Human Resources and Skills Development Canada or any other regulatory agency. All costs associated with Temporary Foreign Worker applications will be paid by the Association and/or Contractor(s).

7.07 The Parties agree to adhere to the following hiring procedure:

a) Each Contractor may name hire or select all forepersons and general forepersons from the Union's out-of-work list;

b) All workers name hired, selected or referred shall be from the appropriate Union's out-of-work list; for those Innu referenced in Article 7.02 there is no requirement for them to be on the out-of-work list;

c) The first worker shall be appointed by the Union who may be appointed as the Shop Steward, with the next five (5) workers being name hired or selected by the Contractor from the Union's out-of-work list and the next five (5) workers being referred by the Union;

d) All remaining hires shall be dispatched on a fifty/fifty (50/50) basis with the Contractor selecting the first worker and the Union referring the next and so on thereafter. The Shop Steward(s) will be appointed from the Union's referrals;

e) i) All hiring will be done through the Union office, and no one will be employed unless they are in possession of a referral slip from the Union office, which must be presented and approved by a Council of Unions Site Representative and/or Shop Steward prior to commencing work unless provided otherwise in this Agreement.

ii) In the event that a prospective worker is given a dispatch slip and has completed the reasonable requirements for hire, they shall report to work as soon as practicable. In the event the Contractor is not ready to engage the prospective worker within fourteen (14) days of the dispatch, the worker may return the dispatch slip and become available to other Contractors.

7.08 a) The Parties agree that highly qualified supervision is fundamental to the success of the Project, therefore the following will apply:

i) Foreperson and general foreperson will be selected or name hired after having received pre-employment multi-faceted training, including but not limited to safety, cultural sensitivity, respectful workplace, labour relations dispute resolution pursuant to the Agreement and productivity;

ii) Foreperson and general foreperson may also be selected or name hired from a group that have not received training described in Article 7.08 a) i) in which case such foreperson or general foreperson shall receive the training set out in paragraph 7.08 a) i) above within a reasonable period of time after being hired;

iii) The Contractor may promote a journeyperson to the position of foreperson or general foreperson. Within a reasonable time after the appointment, such foreperson or general foreperson shall receive the training set out in Article 7.08 a) i) above;

iv) The designation and determination of the number of forepersons and general forepersons is the responsibility of the Contractor. The average ratio of workers to forepersons shall be 10:1 and the average ratio of forepersons and working forepersons to general forepersons shall be 3:1 (with the general forepersons having an average of one (1) working foreperson per general foreperson). The foreperson may be a working foreperson and use the tools of the trade as determined by the Contractor provided the ratio of working forepersons to workers on a crew does not exceed three (3) workers to one working foreperson unless the Trade Appendices provides a higher ratio; and

v) The selection of forepersons and general forepersons must be in alignment with the Benefits Strategy and Gender Equity and Diversity

objectives established in consultation with the Province and Article 7.02 a).

b) The Parties agree that it is fundamental to the success of the Project to have highly qualified trained employees, and accordingly agree to the following:

i) Workers will be selected or name hired by the Contractor and/or referred by the Union from a group of workers that have received pre-employment multifaceted orientation and training, including Site and collective agreement orientation, safety, environment, cultural and gender sensitivity, respectful workplace and productivity, as is set out above in 7.08 a), so that such employees have the skills and tools to succeed; and

ii) In the event that no qualified workers described in 7.08 b) i) are available, workers may be selected or name hired from a group that have not received the pre-employment orientation and training. In which case, such workers shall receive the orientation and training prior to commencing work on the Site.

c) The Parties will collaborate to identify and access available funding for the purposes of developing and delivering pre-employment training as contemplated by 7.08 a) i) and 7.08 b) i). In the event that funding is not available to cover the full cost, any financial shortfall will be the responsibility of the Association and/or Contractor. The Council of Unions members may contribute resources to assist in these important training initiatives and will be reimbursed on a cost basis.

7.09 If the Union is unable to supply the workers required within seventy-two (72) hours or such other time as may be initially agreed by the Association and the Council of Unions, from the date requested, exclusive of Saturdays, Sundays and holidays, the Contractor may hire from other sources. Each worker hired from other sources will be governed by the terms and conditions of this Agreement and shall be represented by the Union and pay initiation fees, dues and other assessments upon and after hiring as per Article 6.

7.10 The Council of Unions recognizes the Contractor's right to evaluate all persons to determine their level of competency, qualifications and physical and medical fitness to perform the required work.

7.11 Once employed on the Site, an employee, subject to Contractor’s approval, shall be permitted mobility from contract job to another contract job within the Site as long as they continue on the payroll of the same Contractor without interruption of earnings at or about the time of change

7.12 Once an employee working on the Site resigns his/her employment with a Contractor, such employee will not be permitted to work on the Site for sixty (60) days from the date such employee ceased to be employed, unless the sixty (60) days is waived by the Association in consultation with the Council of Unions.

7.13 In the event that an employee is terminated or suspended for cause, such employee will not be name hired, selected or referred to the Site, except by agreement of the Parties or in the event the termination is set aside and a lesser penalty is imposed or the

suspension has been served. After any suspension imposed or upheld is served, such employee may be name hired, selected or referred to the Site.

Article 8 Access & Deliveries to Site

8.01 Except as otherwise provided herein, vehicles transporting or delivering persons, equipment, materials, modules, goods and supplies to and from the Site, which are not operated by members of the Council of Unions, shall be permitted to make one drop or pick up on the Site.

Any module, or materials transported to the Site requiring specialized delivery equipment (i.e Mammoet heavy hauler) may be delivered from its point of disembarkation to its point of installation by personnel who are not members of the Council of Unions.

Batch plants, rock crushers and quarry operations on Site or at Designated Quarries shall be covered by the terms of this Agreement. If concrete is required prior to this, deliveries will be made to the points of installation by personnel who may not be members of the Council of Unions. If the capacity of the batch plant(s) operation on Site cannot supply the required concrete in a timely fashion, or in the case of breakdown of the plant(s), or other circumstances outside the control of the Contractor, concrete deliveries may be made to points of installation on an as needed basis only, by personnel who may not be members of the Council of Unions.

All truck transportation of aggregate, till, materials and spoil, for the Site or between the Site and Designated Quarries is under the terms of the Agreement.

8.02 There shall be a fuel depot established on Site as soon as is practicable. Once the fuel depot is established, fueling will be done from a fuel truck operated under the terms of this Agreement. However, during the early works and prior to the installation of a fuel depot, transporting of fuel and fuelling of vehicles and equipment on Site may be done by employees of a fuel supplier, but such employees shall become members of the Council of Unions and receive the wages and terms of employment in this Agreement.

8.03 In order to maintain the validity of a factory warranty, and where it is not practicable to have bargaining unit employees perform the work on any equipment on Site, then the work may be performed by qualified person(s) who are not members of the Council of Unions including vendor representatives where a second or more worker(s) is required they shall be from the bargaining unit.

8.04 Repair work on any equipment on Site where bargaining unit employees do not have the skill, expertise or equipment to perform such work efficiently, the Contractor, in consultation with the Union, may have the repair work performed by persons who are not members of the Council of Unions, with the assistance of the bargaining unit members, if required.

Article 9 Security and Site Regulations

9.01 Subject to the provisions of this Agreement, the Association and Contractor(s) may initiate appropriate measures including the establishment of rules, policies, procedures, standards and regulations to safeguard the Site or a portion of the Site or the area of the Site controlled by the Contractor(s), and to govern the behaviour and conduct of all persons therein.

9.02 The Council of Unions hereby agrees that their members employed on the Project shall observe security procedures, rules, standards and regulations instituted including, but not limited to, identification of personal identity, the recording of the time of any persons entering or leaving the Site, and the search of any vehicles, packages and/or personal baggage, including lunch boxes, entering or leaving the Site.

9.03 This Article is subject to the grievance and arbitration process as per Article 15.01 of this Agreement.

Article 10 Health and Safety

10.01 The Parties acknowledge that health and safety is a shared responsibility for every person participating in the Lower Churchill Project. Both Parties acknowledge that a safety first culture and a healthy work environment will be the foundation of a successful Lower Churchill Project.

10.02 All work shall be performed and equipment operated in accordance with the *Occupational Health and Safety Act* and in compliance with Site regulations, rules, policies, standards or procedures. The Parties recognize that it is the responsibility of everyone to cooperate in the reduction of risk and exposure with the objective of eliminating accidents, health and safety hazards and advocating observance of all safety rules, standards, procedures, regulations and policies.

10.03 Both the Association and the Council of Unions recognize the mutual value of improving, by all proper and reasonable means, the health and safety of the employees and will co-operate to promote health and safety.

10.04 The Contractor(s) agrees to provide to each employee, upon commencement of his/her employment, the following specific articles for use by the employee during the course of his/her employment at the Site:

a) one (1) safety hat colour coded for identification together with a winter liner;

b) one (1) pair of non-prescription safety glasses;

c) one (1) safety vest;

d) appropriate work gloves;

e) rain gear (jacket and pants) and protective clothing (including rubber boots) when the nature of the job requires such clothing; and

f) such equipment shall be of reasonable quality, fit and size for the worker.

10.05 Where the Contractor determines that the nature of the work or working conditions so require, employees shall be supplied, at the Contractor's expense, all necessary safety equipment and/or devices to enable the employee to safely perform his/her duties.

10.06 All such equipment or articles provided under Article 10.04 and 10.05 hereof shall remain the property of the Contractor. It shall be the responsibility of the employee to care for the articles and equipment provided. Should the articles or equipment be rendered unsafe for use due to normal wear and tear during employment, the Contractor shall replace the articles by exchange upon return by the employee. The employee shall be responsible to return such equipment or articles in good working order (subject to reasonable wear and tear) at the end of an employee's employment. Failure to return equipment or articles shall result in the cost thereof being charged to the employee, which the Contractor may deduct from the employee's wages.

10.07 All personal protective equipment as is described in this Article, whether employee or Contractor supplied, shall be Canadian Standards Association approved.

10.08 The Employee shall be responsible to provide his/her prescription eyeglasses and personal safety footwear required for normal working conditions. If the employee requires prescription lenses and does not possess approved prescription safety lenses, he/she shall be entitled to receive reimbursement for the personal provision of safety prescription lenses, up to a maximum cost of two hundred and fifty dollars ($250.00) (subject to verification of receipt to the worker) for the life of the Agreement.

10.09 A Joint Health and Safety Committee shall be established at the Site in accordance with the *Occupational Health and Safety Act* and its Regulations. The frequency of meetings will be determined by the Committee itself, but no fewer than the number required by the *Occupational Health and Safety Act*. All employees on Committee shall receive, without loss of earnings, all training necessary to carry out their duties.

10.10 Medical aid shall be provided at no cost to employees for occupational injuries and diseases in accordance with the *Workplace Health, Safety and Compensation Act* of the Province of Newfoundland and Labrador.

Article 11 Human Rights

11.01 The Parties agree to comply with the Newfoundland and Labrador *Human Rights Act*.

11.02 The Parties agree that there will be no contravention of this Agreement by a Contractor, Association or Union as a result of the Contractor complying with all obligations that benefit the Labrador Innu in this Agreement including but not limited to hiring priority, retention priority, cultural leave benefit or any other benefits or provisions.

Article 12 Diversity and Gender Equity on the Project

12.01 The Association, its Contractor members, the Council of Unions and its Union members will promote and support Gender Equity Programs and Diversity Programs established in accordance with the Benefits Strategy and programs established in order to support the training, hiring and retention of Labrador Innu. The Parties to this Agreement recognize and support the principles of diversity and employment and gender equity in the workplace and will work cooperatively to create a respectful and inclusive work culture.

12.02 The Association, its Contractor members, the Council of Unions and its Union members will support the Lower Churchill Project Gender Equity and Diversity Program and the participation goals for women and underrepresented groups established in consultation with the Province.

Article 13 Strikes, Lockouts and Slowdowns

13.01 The Association, its Contractors, the Council of Unions and its Union members agree that maintaining positive work environment based on trust, respect and accountability is essential to Project success and there should be no strikes, lockouts, or slowdowns, and accordingly, the Parties agree to the following:

a) During the life of this Agreement there shall be no lockout by the Association or Contractors and there shall be no strike on the part of the Council of Unions, the Unions or any employee employed at the Lower Churchill Project. Strikes and lockouts shall have that meaning defined in the Newfoundland and Labrador *Labour Relations Act.*

b) No Union or worker shall refuse to handle or install any material, equipment or components or to honour hot cargo edicts or otherwise during the life of this Agreement.

c) After the Association and/or Contractor has completed an investigation, consulted with the Council of Unions as to the outcome of the investigation and determines that employee(s) have instigated a violation of Article 13.01 a) or 13.01 b), or employee(s) have taken a leadership role in causing a violation of Article 13.01 a) or 13.01 b) to continue, such employee(s) shall be terminated and shall not be referred by the Council of Unions or any of its Union members to the Site. Should such termination be grieved and subsequently arbitrated, the Parties agree that should an arbitrator determine that a violation of Article 13.01 a) or 13.01 b) has occurred and that the grievor was an instigator or had a leadership role in causing the violation of Article 13.01 a) or 13.01 b), the arbitrator shall have no jurisdiction to substitute a lesser penalty.

d) After the Association and/or Contractor has completed an investigation, consulted with the Council of Unions as to the outcome of the investigation and determines that employee(s) have violated Article 13.01 a) or 13.01 b), such employee(s) may be terminated and, if terminated, shall not be referred by the

Council of Unions or its members to the Site without the consent of the Association or for a period of 180 calendar days. Should such termination be grieved and subsequently arbitrated, the Parties agree that should an arbitrator determine that a violation of Article 13.01 a) or 13.01 b) has occurred, the arbitrator shall only have jurisdiction to substitute a lesser penalty if there are exceptional mitigating circumstances. In the event that an employee commits a second violation of Article 13.01 a) or 13.01 b), such employee shall be terminated and shall not be referred to by the Council of Unions or its members to the Site. Should such termination be grieved and subsequently arbitrated, the Parties agree that should an arbitrator determine that a violation of Article 13.01 a) or 13.01 b) has occurred, the arbitrator shall have no jurisdiction to substitute a lesser penalty.

13.02 Nothing herein shall be interpreted or construed to permit or restrict access to the grievance and arbitration provisions or to limit the remedies available to the Association and/or Contractor or Council of Unions in the event of a violation of Article 13.01 a) or 13.01 b).

Article 14 Labour Relations Management Program and Dispute Resolution that Distinguishes Project

14.01 The Association, its Contractors, the Council of Unions and its Union members agree to the following:

a) Provide strong leadership in both the Association and Council of Unions in dealing with all workplace issues and disputes;

b) Commit to dealing with work related issues or disputes on the Site in a timely and collaborative manner with minimal impact to the working environment;

c) Administer the grievance and arbitration process in a way that adheres to the above principles and ensures such grievances and arbitrations are dealt with in a timely and collaborative manner with minimal impact; and

d) Achieve consistency across the Site to the standards and obligations found within the Collective Agreement.

14.02 Both the Association and Council of Unions agree to form a Liaison Committee to work collectively to achieve the following:

a) Promote and maintain a safety first and healthy work environment;

b) Adhere to Article 14.01 above;

c) Promote and maintain open and respectful communication in regard to all matters pertaining to the Project or the Agreement;

d) Maximize productivity to ensure completion on, or ahead of schedule;

e) Foster and maintain proactive and positive labour relations;

f) Speedy resolution of disputes or issues arising under the Agreement; and

g) Address matters of mutual interest pertaining to the Project and/or this Agreement.

14.03 The Liaison Committee shall maintain a maximum of seven (7) and a minimum of five (5) representatives of the Association and a maximum of seven (7) and a minimum of five (5) representatives of the Council of Unions. At any meeting of the Liaison Committee, each of the Association and the Council of Unions shall be entitled to cumulative representation equal to the number of representatives present from the other Party. Each Party shall notify the other in writing of its designated representatives on the Liaison Committee

14.04 A meeting of the full Liaison Committee shall occur once every three (3) months, or more often if necessary, on written request of a Party.

14.05 The Liaison Committee will create a subcommittee for more frequent meetings. The Council of Unions and Association will appoint representatives to be members of the subcommittee. A meeting of the subcommittee of the Liaison Committee shall occur monthly, or more often if necessary, on written consent of the Parties.

Article 15 Grievance and Arbitration

15.01 A dispute arising out of the interpretation, application or alleged violation of this Agreement, including a dispute as to whether a matter is arbitrable, but excluding disputes under Article 17 (Pre-Job Conference) or Article 18 (Work Team Composition), which shall not be subject to the herein grievance procedure, shall be adjudicated in accordance with the following procedures:

a) An employee assisted by his/her Shop Steward, if he/she so desires, and the employee's immediate non-bargaining unit supervisor shall meet to discuss and, if possible, resolve such matter. Such resolution shall not contravene the terms and conditions of the Collective Agreement; it is solely for the purpose of resolving the matter and shall not be considered precedential or binding in any other grievance dispute.

b) STEP 1: If the matter discussed in a) above cannot be settled by the Steward and the non-bargaining unit supervisor then the grievance shall be reduced to writing within five (5) days after the circumstances giving rise to the grievance. The supervisor shall render his/her decision, in writing, within five (5) days of his/her receiving the written grievance. The written grievance shall state the alleged violation, the date of the violation, the facts describing the alleged violation, the location of the violation, the person or entity committing the violation, the Article or Articles of the Agreement alleged to have been violated and the remedy sought.

c) STEP 2: Should the written decision rendered in Step 1 be unsatisfactory to the employee or should no decision be rendered, the employee, assisted by the Council of Unions Site Representative, shall submit the written grievance within a further two (2) days to the Association and the Contractor's Designated Representative on the Project.

The Association representative, the Council of Unions representative, the Contractor's representative and the employee, assisted by the Steward, shall meet within five (5) days to discuss the matter. Prior to the second step meeting, the Association and Council of Unions commit to engage in a joint fact finding exercise with a view of developing a common understanding of the facts surrounding the dispute to better position the Parties to resolve such dispute. The Contractor shall render a decision in writing within one (1) day of the second step meeting. If such a meeting is not held, the matter shall be referred to Step 3.

d) STEP 3: Should the decision rendered at Step 2 be unsatisfactory, within two (2) days of the decision, the Contractor, the Association representative and the Council of Unions representative shall meet to discuss the matter. If no resolution can be achieved within two (2) days of such a meeting, either the Council of Unions or the Association may, within five (5) days of the meeting, refer the matter to arbitration in accordance with the procedure contained herein. If such meeting is not held, the matter may be referred by either the Council of Unions or the Association to the next step -- arbitration.

15.02 No employee shall be disciplined or discharged except for just cause. Any dispute arising out of the discipline or discharge of an employee shall commence at Step 3 and may be referred to arbitration in the same manner as an employee’s grievance.

15.03 The Association or Council of Unions may file a grievance, in writing, with the other Party within five (5) days after the circumstances giving rise to the grievance have occurred or originated or within five (5) days of the Association or Council of Unions becoming aware of such circumstances. If such grievances are not resolved within two (2) days, the grievance may be treated as a grievance commencing at Step 3 and may be referred to arbitration in the same manner as an employee's grievance.

15.04 The appointment of an arbitrator will be made within four (4) days of a referral to arbitration under Step 3. The arbitrator shall be selected in rotation from a list of five (5) arbitrators acceptable to the Parties, which list is attached hereto as Schedule “D” and forms part of this Agreement. The list shall be reviewed and may be updated by the Parties once every year during the term of this Agreement. Should the arbitrator, who is next in rotation, be unable to act within the time requirements set out in this Article, he/she shall be passed over to the next person on the list.

15.05 The arbitrator shall, within thirty (30) days of his/her appointment, convene an arbitration hearing to hear the relevant evidence. The decision of the arbitrator shall be final and binding on the Parties.

15.06 The arbitrator shall not have any power to alter, change, add to or detract from the Agreement or to substitute any new provision for any existing provision nor to give any decision inconsistent with the terms and provisions of this Agreement. An arbitrator shall

not dismiss any grievance on a technicality or error on the grievance form provided the grieving party has provided the particulars set out in Article 15.01 b).

15.07 In the interest of providing speedy resolution to grievances, arbitration hearings shall be conducted by video and/or telephone conference call unless mutually agreed otherwise, with the Association representative and the Council of Unions representative or their designated respective legal counsel(s) acting as presenters. All rulings will be given by the arbitrator within fifteen (15) days.

15.08 The time limits specified in this procedure are mandatory. Failure of a Party to file a grievance within the time limited or failure of the grieving Party to advance a grievance to the next step in the time limited shall mean the matter is not grievable and shall constitute abandonment.

15.09 The Parties may, by mutual consent and in writing, extend the time limits of this grievance and arbitration procedure, which consent shall not be unreasonably withheld. In order to take into account applicable work schedules, reference to a number of “days” within this Article 15 shall be construed as working days.

15.10 The Contractor/Association, whichever is the case, and the Council of Unions involved in an arbitration shall pay the fees and expenses of the arbitrator in accordance with the following:

a) In the event the arbitrator makes a determination that there is a losing Party(s) the arbitrator may order the losing Party(s) to pay the arbitrator’s fees and expenses.

b) In the event the arbitrator makes no order as to the payment of fees and expenses, each of the Party(s) shall pay an equal share of the fees and expenses of the arbitrator.

Article 16 Shop Stewards

16.01 Stewards shall be appointed by the Union Business Manager or his/her representative. Skill, ability and competency as well as Gender Equity and Diversity shall be considerations in the appointment of Stewards. When a scheduled second and/or third shift occurs, Stewards for such shift(s) may be appointed at the discretion of the Business Manager. Such appointments shall be confirmed in writing to the Contractor and the Association. Stewards assigned to represent a particular shift will not retain their status if that shift is cancelled; however, where workers are transferred to another shift the former Steward shall be one of the transferred provided that the Steward has the skill, ability and competency to perform the required work.

16.02 This Article 16 does not affect a Contractor’s right to determine where and when employees work or on what shifts they work on; however, the Steward shall be assigned to shifts in consultation with the Union Business Manager to assure the most appropriate coverage for the worksite.

16.03 Stewards shall not be discriminated against in the performance of union duties. The Steward will notify and obtain permission from his/her immediate supervisor before leaving his/her work location to deal with any matter relating to this Agreement, which permission will not be unreasonably denied.

16.04 There shall be no non-working Stewards. Subject to Article 16.03 above, Stewards will be granted sufficient time to conduct their legitimate union duties during working hours.

16.05 Stewards shall be the last employee laid off where the Steward has the skill, ability and competency to perform the required work.

16.06 Where overtime is worked by a crew, the Steward shall be one of the overtime crew or a replacement shall be designated by the Union Business Manager or Steward in the event he/she does not possess the necessary skill, ability and competency to perform the required work.

Article 17 Pre-Job Conference

17.01 a) The Parties agree in principle that obtaining high standards of labour productivity will be a key factor for Project success. Accordingly, given the importance of the Project to the people of Newfoundland and Labrador, the Association, its Contractor members, the Council of Unions and its Union members should each take affirmative steps to ensure productivity opportunities are maximized by all stakeholders including the Owner, Contractors, the Association, the Council of Unions and its Union members.

b) Each Union maintains claims to jurisdiction pursuant to the Plan for the Settlement of Jurisdictional Disputes in the Construction Industry (commonly called the "Green Book" and referred to hereinafter as the "Plan"). In order to provide for orderly and mutual understanding between the Council of Unions, the Association and Contractors, the Council of Unions shall provide an electronic copy of the Plan and an electronic copy, where available, of the following:

i) Agreements of Record including (Attested Agreements which have priority over Non-Attested Agreements);

ii) All Decisions of Record;

iii) Prevailing practices in Newfoundland and Labrador that have been documented; and

iv) Trade practices in the industry that have been documented.

17.02 The Association and/or the Contractor shall give notice to the Council of Unions of all contracts awarded which come within the scope of this Agreement. Wherever possible, a mark-up conference will be conducted prior to the commencement of work.

17.03 In order to minimize and resolve initial work assignments or initial assignments to assist in determining the composition of Work Teams a mark-up will be held. The mark-up will be in accordance with the following timetable:

a) **Day 1** – The Association or the Contractor will give written notice of a mark-up meeting and issue initial assignments to the Council of Unions and all Unions. A copy of drawings and specifications will be placed in the Council of Unions' St. John's office.

b) **Day 4** – The Association and/or the applicable Contractor will convene a mark-up meeting to outline the scope of work and record claims of Unions on initial assignments. All claims for work shall be finalized at the mark-up meeting or by prior written notice from the Union.

c) **Day 6** – The Association and/or the applicable Contractor will distribute a record of all claims made at the mark-up meeting.

d) **Day 8** – Last day of claiming or defending Unions to file evidence in support of their claim or assignment wherever possible Parties should endeavour to provide any and all copies of the evidence on which they seek to rely.

e) **Day 11** – The Association or Contractor will notify all Unions of final assignment(s).

f) **Day 13** – Last day for claiming Union to request jurisdictional umpire, failure to do so leading to the relinquishment of the right to call for an umpire for the assignment(s) made on Day 11.

g) **Day 17** – Last day for the jurisdictional umpire to hold a hearing.

h) **Day 20** – Last day for the jurisdictional umpire to render a decision.

The foregoing timetable may be revised by mutual written consent from the RDTC and the Association, the umpire may, with the consent of the Parties, vary the process following his appointment to facilitate the prompt processing and adjudication of claims.

17.04 Days are calendar days excluding Saturdays, Sundays and recognized holidays as listed in Article 23. Each day shall end at 5:00 p.m. local (location of the mark-up meeting) time.

17.05 Having regard for special requirements for construction of a project of this type, together with safety, efficiency, maintaining maximum levels of labour productivity, cost, continuity and good management, the Parties have agreed to an intended assignment plan by a jurisdictional umpire they have selected. The Association and the Council of Unions will retain the services of a jurisdictional umpire. The umpire shall be selected in rotation from a list of five (5) umpires acceptable to the Parties, which list is attached hereto as Schedule C1 and forms part of this Agreement. The list shall be reviewed and may be updated by the Parties once every year during the term of this Agreement. Should the umpire who is next on rotation be unable to act within the time requirements set out in this Article, or for reasons of conflict of interest, he/she shall be passed over to the next person on the list.

17.06 The procedural rules of the jurisdictional umpire, jurisdiction and operational restrictions shall be as set forth in the Plan except as modified by this Agreement.

17.07 a) The existence of a Work Team or the choice to assign any of the marked up work to a Work Team is not subject to review by an umpire on the following conditions:

i) upon completion of the mark-up process after the initial assignment where there are no claims; or

ii) in the event of a challenge as to a work assignment in the final mark up after the umpire process and other appeal processes contained herein have been exhausted.

b) Unions or Contractors may make claims and request jurisdictional review of the initial assignment of work to a specific Union.

c) Unions or Contractors may make claims and request jurisdictional review to ensure work assignments in the mark-up are followed.

17.08 The Parties shall take affirmative steps to ensure productivity opportunities are maximized. An umpire, in resolving a disputed work assignment in a mark-up or a dispute as to whether a mark-up is being followed, shall consider the following factors:

a) Agreements of Record and Decisions of Record established by or reported by the Impartial Jurisdictional Dispute Board, established international trade practices, prevailing practices as defined, together with a reasonable acceptance of considerations for efficiency and capacity to furnish construction services to the public at reasonable costs.

17.09 If the Association and/or the Contractor and the Unions involved cannot agree to accept the jurisdictional umpire's decision, any one of them can refer the dispute to the Canadian Plan. The criteria for considering any appeal shall be as per Article 17.01 b) and 17.08 herein.

17.10 The jurisdictional umpire cannot award costs or damages.

17.11 The Contractor/Association, whichever is the case, and the Unions involved in a dispute shall pay a share of the fees and expenses of the jurisdictional umpire in accordance with the following:

a) The umpire shall determine the losing Party in each case;

b) If the Contractor or Association's final assignment is changed by the umpire, the Contractor or Association (whichever Party made the assignment) AND the originally assigned Union are the losing Parties and they shall equally share the umpire's fees and expenses;

c) If the Contractor or Association's final assignment is not changed by the umpire, the claiming Union shall pay the umpire's fees and expense; and

d) In the event that the disputing Unions agree on how to perform the work but the Contractor disagrees and the umpire upholds the Union's position then the Contractor is deemed to be the loser and shall pay the umpire's full fees and expenses.

17.12 All jurisdictional disputes shall be resolved without the occurrence of any strike, work stoppage or slow down and the Contractor's final assignment shall be respected. The work will continue unless otherwise directed by the jurisdictional umpire under the intended assignment plan and that intended assignment shall continue in force and effect unless varied by the decision of a Canadian Plan Arbitrator.

17.13 Given the remoteness of the Site, all mark-up meetings and jurisdictional umpire hearings will take place in St. John's via video conference and/or telephone conference call unless otherwise agreed.

17.14 This procedure is available to and binding upon all Unions, the Council of Unions, the Contractor(s) and the Association. The Association will ensure that its Contractor(s) shall comply with the provisions of this Article, the procedures herein, and promptly implement decisions that are made. Such Contractor(s) shall abide by the outcomes of the process. The Council of Unions will ensure that the Union(s) shall comply with the provisions of this Article and the procedures therein. Such Union(s) shall abide by the outcomes of the process.

17.15 The local Union Business Manager or his/her delegate, the Union International Representative, the affected Contractor and Association, to ensure the efficiency and success of the implementation and/or operation of this Article, Schedule B and the Plan, shall participate in the markup process, umpire's process and arbitration processes.

17.16 The Parties agree to develop a training and education process for Council of Unions members and Association members to ensure this Article, Schedule B and the Plan are administered so as to maximize the benefit to all Parties and minimize disputes.

Article 18 Productivity Enhancement Through the Utilization of Work Teams

18.01 Where a Work Team is to be utilized by the Association and/or Contractor, the following procedures shall be employed:

a) The full process of the mark-up as is set out in this Agreement shall be applied. This process shall establish the Unions involved in that Work Team;

b) The Association and/or the Contractor shall notify the Council of Unions and the affected Unions designated by the mark-up process of the establishment of a Work Team as well as the composition of such team;

c) The composition of the Work Team shall be based on the overall percentage each Union has relative to the overall work to be performed by that Work Team as determined by the Association and/or Contractor; and

d) If, during the execution of the work, the nature of the work changes which impacts the composition of the team, a panel shall be requested to review the numbers and change them to comply with the percentages deemed appropriate.

18.02 This panel shall consist of three persons who shall serve for the duration of the Project. In the event that any one of the panellists can no longer serve for whatever cause, the Parties agree to forthwith replace their nominee or to agree to the independent third party (ITP). If the Parties cannot agree to an ITP, they shall apply to the Minister of Labour, Government of Newfoundland and Labrador, for the appointment of the ITP. The panel shall consist of three persons:

a) One appointed by the Association;

b) One appointed by the Council of Unions by its Executive; and

c) An ITP who is neither a lawyer nor an arbitrator under this Agreement and is familiar with jurisdiction.

18.03 This panel may investigate the initial or subsequent composition of the Work Team, when and if requested by one of the Parties.

18.04 Decisions of the panel, by agreement of the Parties, shall be final, binding and not subject to appeal, judicial review or any other form of judicial intervention.

18.05 Decisions of the panel shall be made on an expedited basis:

a) Any dispute as to the initial composition of a Work Team as established under Article 18.01 will be referred in writing to the panel within seven (7) days of the Contractor advising the Union in writing of the initial composition of the Work Team. The referral must itemize the issues in dispute, including the number of members a Union is claiming should be on the Work Team or any other issues as to the composition of the Work Team in dispute;

b) All referrals to the panel will be heard within seven (7) days of such written referral. Notice of the referral shall be provided to all affected Parties by the referring Party. Each Party shall have the right to present evidence and make representations to the panel, which presentation of evidence and/or making of representation shall be limited to two (2) hours unless such period is extended by a majority of the panel. The panel will render its decision within forty-eight (48) hours of the completion of the hearing. All decisions must be by a majority of the panel;

c) From time to time, as work advances, the composition of a Work Team may be revisited and adjusted as appropriate by the panel upon request of the Contractor or any Union providing workers to the Work Team. In no event shall a Work Team be revisited within ninety (90) days after the panel has rendered a decision

as to the composition of a specific Work Team except in the event there has been a material change in circumstances; and

d) There will be no claims permitted for lost wages, other benefits or premiums as a result of an adjustment to the Work Team, and Work Teams will continue to work cooperatively, without disruption, while any claim to adjust a Work Team is being adjudicated.

18.06 The following shall apply to each Work Team:

a) Each Union shall provide members to work on the Work Team on a pro-rated basis as per the distribution determined by the Contractor or in accordance with this Article.

b) The Union that provides the greatest number of employees to the Work Team shall provide the first requested foreman/general foreman subject to availability. If more foremen are requested, such foremen shall be provided on a pro-rated basis if practical.

c) Unions dispatching members to a Work Team shall advise members they will be working on a Work Team.

A willingness to work on a flexible basis if the needs of the work so dictate is the essential element of a Work Team. It is understood that while on a Work Team an employee may be required to work in and outside of his/her trade or craft.

Article 19 Regular Work Schedule, Extended Work Schedule, and Overtime Provisions to Address Unique Project Needs

19.01 The Association, its Contractor members, the Council of Unions and its Union members agree to the following guiding principles to be taken into account for the creation of hours of Work Schedules and overtime provisions contained herein:

a) The nature of the work;

b) Cultural issues;

c) Seasonality of work;

d) Weather conditions such as wind, rain, snow and cold;

e) The remoteness of the work area;

f) The need to be flexible to meet project needs; and

g) These provisions are not intended to reduce or replace overtime provisions to which Employees would otherwise be entitled.

19.02 The Association, its Contractor members, the Council of Unions and its Union members recognize that developing Regular Work Schedules will be important to Project success and accordingly agree to the following guiding principles and application of this Article:

a) Take into account geographical source of workforce; and

b) Structure Work Schedules to attract and retain a highly skilled and productive workforce.

Regular Work Schedule/Overtime Premiums

19.03 The following Article is intended to identify regular hours of work, Work Schedules and overtime hours. In order that there shall be consistency on the Site, the following hours of work and scheduling shall apply:

a) The regular work week shall consist of forty (40) hours of work divided into five (5) consecutive eight (8) hour work days from Monday to Friday, or four (4) consecutive ten (10) hour work days from Monday to Thursday. The start time for the day shift for a regular work day will be between 5:00 a.m. and 9:00 a.m.

b) Overtime premiums shall be paid as follows for the work week consisting of five (5) consecutive eight (8) hour work days:

i) All hours worked in excess of eight (8) hours per day at double the straight time rate of pay; and
ii) All hours worked on the Saturday, Sunday, scheduled days of rest and Recognized Holidays at double the straight time rate of pay.
iii) All hours worked after a Regular Work Schedule or an Extended Work Schedule have been completed and prior to the commencement of an employee's next Regular Work Schedule or Extended Work Schedule, shall be paid double the straight time rate of pay.

c) Overtime premiums shall be paid as follows for the work week consisting of four (4) consecutive ten (10) hour work days:

i) All hours worked in excess of ten (10) hours per day at double the straight time rate of pay;
ii) For all hours worked up to ten (10) hours on every Friday of any Work Schedule of ten (10) consecutive days or more, at one and one-half (1 ½) the straight time rate of pay;
iii) All hours worked on Saturday and Sunday of any schedule, or on the Friday of any schedule not requiring work on ten (10) or more consecutive days, at double the straight time rate of pay; and
iv) All hours worked after a Regular Work Schedule or Extended Work Schedule have been completed and prior to the commencement of an Employee's next Regular Work Schedule or Extended Work Schedule, shall be paid at double the straight time rate of pay.

Extended Work Schedules

19.04 The Parties understand and agree that the remote nature of the Project and the climatic conditions pose exceptional challenges in the successful completion of the work. To this end the Contractors, through the Association, may make use of Extended Work Schedules which are set out below. Such Work Schedules shall consist of scheduled days of work followed by scheduled days of rest. All hours worked on a scheduled day of rest shall be paid at double time the straight time rate of pay.

Extended Work Schedules

21 days on and 7 days of rest x 10 hours/day;

10 days on and 4 days of rest x 10 hours/day;

14 days on and 7 days of rest x 10 hours/day;

14 days on and 14 days of rest x 10 hours/day;

20 days on and 8 days of rest x 10 hours/day;

20 days on and 10 days of rest x 10 hours/day;

28 days on and 14 days of rest x 10 hours/day

Other Designated Shifts

6 days on and 1 day of rest x 10 hours/day

7 days on and 7 days of rest x 10 hours/day;

7 days on and 7 days of rest x 12 hours/day.

1. These Extended Work Schedules allow for an any-day start. Examples of hours paid and hours worked for each Extended Work Schedule are contained in Schedule [E].

2. Additional Extended Work Schedules may be implemented by the Association after meaningful consultation with the Council of Unions.

3. The Work Schedules and related terms for Site Service Worker shall be contained in the trade appendices for those Employees

General

19.05 An Employee who is transferred to a different Work Schedule must be provided with a minimum of two (2) scheduled work days' notice. If an Employee requests a transfer and it is approved, overtime rates will not apply for days worked that that Employee would have been entitled to under his/her previous Work Schedule. If the transfer is not as a result of an Employee request, overtime provisions will apply for days worked on the scheduled days of rest that the Employee would have been entitled to under his/her Work Schedule.

19.06 There shall be no pyramiding of overtime and/or premiums nor shall such overtime and/or premiums be in addition to, but not limited to Reporting Time under Article 21,

Call Out under Article 22 or pay for working a Recognized Holiday under Article 23 or height pay.

19.07 Unpaid lunch breaks will normally be at mid-shift (usually between 1100 and 1300) but may be staggered to coincide with start time and shall be one half (1/2) hour. An Employee who is required by the Contractor to work through the two (2) hour period shall be paid at the applicable overtime rate for one half (1/2) hour and shall, as soon as practicable thereafter, be given sufficient time, for which he/she will be paid to consume his/her meal.

19.08 One paid rest break of ten (10) minutes will be allowed during each half shift in an eight (8) hour shift. One paid rest break of fifteen (15) minutes will be allowed during each half of a ten (10) hour or greater shift. The scheduling of such rest breaks shall be at the time set by the Contractor per Employee but shall normally be midway through each half shift unless there are unusual or overriding circumstances requiring change of breaks.

19.09 The Parties are committed to delivering value for paid time accordingly:

a) Unless some other reporting location is designated by the Contractor, Employees shall be in attendance at their work location and prepared to commence work at the scheduled starting time for their respective shifts. Employees shall only be paid when they start work at their designated work location, not the point where they enter the Site. The worker will be at the designated brass point (card swipe), at the quit time. Employees, where appropriate, shall have reasonable time for clean-up and to store their tools before leaving their work location at the end of the shift.

b) Employees shall be diligent in respecting start and shift completion times.

19.10 a) When an Employee is required to work in excess of ten (10) hours and less than twelve (12) hours he/she shall be provided a twenty-five ($25.00) dollar meal allowance in lieu of a meal. He/she shall also be paid an additional twenty (20) minutes at double the straight time rate of pay in lieu of a meal time break. Employees affected by this Article, who are residents in the Camp, shall also receive a Camp supplied hot meal at the Accommodations Complex.

b) When an Employee is required to work in excess of twelve (12) hours, he/she shall be provided a hot meal, where feasible, at the end of the ten (10) hour shift and after each four (4) hours thereafter. The Employee shall be allowed twenty (20) minutes at double the straight time rate of pay to consume his/her meal. A ten (10) minute rest break shall be provided every two (2) hours.

19.11 When a general foreperson or foreperson is required to extend his//her shift (early start and/or late quit) for the purposes of organizing work or dealing with turnover issues to the oncoming shift up to a maximum of one (1) hour, Article 19.10 will not apply unless his crew also receives the meal and that foreperson (general foreperson) is required to supervise that crew. The general foreperson and/or foreperson shall be compensated at the overtime rate of pay for the time worked.

19.12 The hours of work and overtime provisions for Employees represented by the Hotel Employees and Restaurant Employees International Union and Local Union 779 and the International Brotherhood of Teamsters and Local 855 are set out in the Trade Appendices for each of those trades. The hours of work for the Employees they represent shall be governed by those Trade Appendices, save and except where those Trade Appendices direct that the provisions of Article 19 apply.

19.13 The nature of the work on the Project shall, from time to time, require the interruption of work, which shall result in temporary layoff of Employees for short periods of time. For those work interruptions not exceeding thirty (30) days, the Contractor shall advise the affected Union(s) of its recall needs and those Union(s) shall issue a referral slip in the same order as the initial hire of those temporarily laid off.

19.14 Work on the Site may be reduced during periods like Christmas/New Year's; however, certain Employees may be scheduled to work. Advance notice will be provided to all Employees regarding the observance dates, once available.

19.15 Nothing in this Agreement shall be construed as guaranteeing hours of work per day, per week, the days of work in any week or the days of work in any Work Schedule.

Article 20 Shifts

20.01 The scheduling of the number of days of work in a week, the number of shifts in a day and the number of hours in a shift shall be at the sole discretion of the Contractor.

20.02 The start time for the day shift for a regular work day shall be between 5:00 a.m. and 9:00 a.m.

20.03 For workers assigned to snow removal, site services, transportation, road maintenance or similar work there may be times when, due to climatic conditions or abnormal circumstances, workers are required to commence their shift prior to 5:00 a.m. and the shift will not commence prior to 3:00 a.m. For all other workers the start time, subject to climatic conditions or abnormal circumstances, will not vary on a daily basis, but may be adjusted to deal with job conditions.

20.04 The nature of the work on this Project may require, from time to time, the delay of the commencement of a shift due to climatic conditions or abnormal circumstances.

20.05 The second shift may commence at any time between the hours of 4:00 p.m. and 9:00 p.m. and nothing herein shall restrict the Contractor from implementing a third shift if business or other requirements necessitate. These shifts are to be classified as Shift Schedule(s) rather than as overtime and shall be scheduled for the duration of at least one (1) Work Schedule unless valid business reasons dictate otherwise.

20.06 A shift premium of three dollars ($3.00) per hour shall be paid for all hours worked on other than the day shift, whether or not the time worked is overtime or straight time. There shall be no pyramiding.

20.07 No worker shall work more than one (1) straight time shift in each consecutive twenty-four (24) hour period. A worker shall receive the overtime rate for each hour worked beyond the straight time shift until a break of eight (8) consecutive hours occurs.

20.08 An employee whose shift is changed (moved from one shift to another shift) shall receive twenty-four (24) hours' notice of the shift change. No employee shall suffer loss of regular earnings due to his/her shift change.

If a worker requests a transfer and it is approved, then overtime rates will not apply for days worked on the scheduled days of rest that the worker would have been entitled to under his/her previous Work Schedule unless any of the days worked in the new Work Schedule are deemed to be premium days, in which case the applicable premium rate will apply.

Article 21 Reporting Time

21.01 If the employee reports to work as requested at the regular starting time and is not put to work, the so affected employee shall be entitled to be paid to the employee's mid-shift at the applicable rate.

21.02 If the employee reports to work as requested at the regular starting time and is put to work, the so affected employee shall be paid all hours worked at the applicable rate of pay and in no case less than to mid shift at the applicable rate.

21.03 If the employee is given two (2) hours' notice not to report for work, he/she shall not receive any reporting time.

21.04 If the employee reports to work as requested at the regular starting time and is requested to stand by, either at the workplace or another area designated by the Contractor, the so affected employee shall be paid for all hours he/she works and stands by at the request of the Contractor at the applicable rate of pay and in no case less than to mid shift at the applicable rate.

21.05 In order to qualify for reporting time, the employee must remain on the job until otherwise directed by the Contractor.

21.06 When the conditions set forth in this Article occur on other than day shift, the shift premium as set out in Article 20 shall be paid.

21.07 A worker who is resident in Camp shall not be eligible for payment of reporting time if notice of "no work available" is posted on the Camp kitchen bulletin board at the pre-shift meal at least two (2) hours prior to regular shift start. Non-camp residents shall not be eligible for payment of reporting time if they have been provided at least two (2) hours' notice by their employer that there is no work available; such notice can be by telephone, telephone call-in system, public radio or personal notice.

Article 22 Call Out

22.01 Employees who have completed their day's scheduled hours of work and have left the work site or have returned to the Camp and are called out and return to work, such employee shall receive no less than four (4) hours' pay at the overtime rate. Workers who work in excess of four (4) hours shall be paid for the actual hours worked at the appropriate overtime rate until the commencement of their regularly scheduled shift.

22.02 When the conditions set forth in this Article occur on other than day shift, the shift premium as set out in Article 23 shall be paid.

Article 23 Vacation and Recognized Holidays

23.01 Vacation pay and recognized holiday pay shall be paid as part of an employee's regular paycheque in accordance with the Trade Appendices, attached as Schedule "D".

23.02 The following recognized holidays will be observed:

a) New Year's Day

b) Family Day

c) St. Patrick's Day

d) Good Friday

e) Victoria Day

f) Canada Day

g) Civic Holiday

h) Labour Day

i) Thanksgiving Day

j) Remembrance Day

k) Christmas Day

l) Boxing Day

23.03 All work performed on a recognized holiday shall be paid at the rate of double the regular rate.

23.04 The date of observation of recognized holidays shall be as gazetted by the Provincial Government or as mutually agreed between the Association and the Council of Unions.

23.05 An employee who is entitled to take vacation shall notify his/her Contractor in writing and such request shall not be unreasonably denied. The date of same shall be mutually agreed between the employee and the Contractor before the vacation is taken. No more

than twenty-five (25) per cent of the members of a crew may be on vacation at a given time.

Article 24 Camp Accommodations

24.01 An Accommodations Complex shall be provided, maintained and operated in full compliance with all applicable laws and regulations. During the early work phase of the Project, a temporary Accommodations Complex may be provided to accommodate workers until the Accommodations Complex becomes available.

24.02 The Owner or his/her designee shall have the sole right to manage the Accommodations Complex, including the assignment of accommodations. Such accommodations shall be suitable, properly maintained and operated.

24.03 An Accommodations Complex Committee composed of an equal number of representatives from the Association and Council of Unions shall be established for the purposes of providing input as to the development, implementation and administration of accommodation rules.

24.04 Workers living in the Accommodations Complex who do not report for work on a regular work day due to causes other than legitimate illness and/or legitimate absences when they are physically able to do so, may be charged the full room and board rate for each regular day not worked.

24.05 Workers failing to make use of Accommodations Complex on a repeated basis may be charged at the full room and board rate for each day not used and may forfeit their right to accommodations.

24.06 Accommodations Complex residents will be provided with sufficient and suitable food appropriate for the required breaks specified under this Agreement.

Article 25 Travel and Board

25.01 For the purpose of this Article, the definition of “permanent residence” for a resident of Newfoundland and Labrador shall be the same as the definition of Provincial Residence in this Agreement and for those outside of Newfoundland and Labrador, as follows:

> “An Employee’s permanent residence is the place where he/she maintains a self-contained domestic establishment where he/she ordinarily resides such as a dwelling, house or similar place of residence where a person generally eats and sleeps. Factors and/or current documents to be examined when determining who is a resident may include property tax assessment, lease agreement, driver’s licence, vehicle registration, income tax returns, voter’s list registration or proof of provincial health care coverage.”

25.02 Free Zone: There shall be a Free Zone of thirty-five (35) road kilometres from a designated pick up location in Happy Valley-Goose Bay, to the city or town boundary of the employee's permanent residence. Employees living within the Free Zone shall travel to and from the designated pick up location at their own expense. The Association will establish a daily commuting busing system from designated pick up areas within the Free Zone, which designated pick up areas will include a location in Sheshatshiu, North West River and Happy Valley-Goose Bay. Given the limited parking available at the Site, employees whose permanent residence is in the Free Zone and Travel Zone shall be required to utilize the commuting service, at no cost, to travel to and from the designated pick up areas to a designated location at or near the Site.

25.03 Travel Zone: Employees traveling to work who predominantly reside a distance greater than thirty-five (35) kilometers but less than one hundred (100) kilometers from the designated pick up location at Happy Valley-Goose Bay, to the city or town boundary of the community of the employee's permanent residence shall be paid travel allowance set out in Article 25.06 per road kilometer one way between the above noted points.

25.04 Employees travelling to work who permanently reside at a distance of one hundred (100) kilometers or greater, from the designated pick up location at Happy Valley-Goose Bay, to the city or town boundary of the community of the employee's permanent residence shall, to the extent of the capacity of the Accommodations Complex and other accommodations available to the Contractor, be provided with accommodations at no cost to the employee.

25.05 When an employee is entitled to accommodations pursuant to this Article and accommodation or space is not available, such employee shall be provided a board allowance in accordance with Article 25.07.

If accommodation space becomes available, such employee must commence residing at the accommodations within seven (7) days of being so notified. The employee shall cease being paid the board allowance once they commence residing at the accommodations or upon the expiration of seven (7) days of being notified, whichever is first.

25.06 The travel allowance in accordance with Article 25.03 shall be as follows:

a) $0.72 per road kilometer effective May 1, 2012;
b) $0.74 per road kilometre effective May 1, 2013;
c) $0.76 per road kilometer effective May 1, 2014;
d) $0.78 per road kilometer effective May 1, 2015;
e) $0.80 per road kilometer effective May 1, 2016;
f) $0.82 per road kilometer effective May 1, 2017.

25.07 The board allowance in accordance with Article 25.05 shall be as follows:

a) $100.00 per day effective May 1, 2012;
b) $104.00 per day effective May 1, 2013;
c) $108.00 per day effective May 1, 2014;
d) $112.00 per day effective May 1, 2015;
e) $116.00 per day effective May 1, 2016;
f) $120.00 per day effective May 1, 2017.

25.08 Zone 1 through 5:

An employee, whose permanent residence is located in Zones 1 through 5 as set out below shall be provided a Travel Allowance for Work Schedules of ten (10) consecutive days or more, provided the employee travels by road from the Site or Accommodation Complex to the employee's permanent residence during a Work Schedule turnaround and upon providing proof of travel expense in a form satisfactory to the Contractor. The Travel Allowance shall be payable as follows:

a) Zone 1 (100 – 200 km) - $90 (round trip);
b) Zone 2 (201 – 300 km) - $120 (round trip);
c) Zone 3 (301 – 400 km) - $150 (round trip);
d) Zone 4 (401 – 500 km) - $220 (round trip);
e) Zone 5 (501 – 700+ km) - $260 (round trip).

25.09 Employees on a Work Schedule of ten (10) or more consecutive days, whose permanent residence is located outside of Labrador or in an area of Labrador only accessible by air, will be provided by the Contractor, during each Work Schedule turnaround, the following:

a) For permanent Newfoundland residents, air transportation to and from St. John's, Deer Lake, Gander or such other designated hubs in Newfoundland to Happy Valley-Goose Bay;

b) For permanent Labrador residents, air transportation to and from designated hubs in Labrador to Happy Valley-Goose Bay; and

c) For permanent residents outside Newfoundland and Labrador, air transportation to and from designated hubs in other parts of Canada to Happy Valley-Goose Bay.

In the event that an overnight stay is required while in transit to the Site because of a disruption in air travel, the Contractor shall provide a Temporary Accommodation Allowance of one hundred and twenty dollars ($120.00) for each day the employee is delayed provided such employees permanent residence is one hundred (100) kilometers or more from the departing hub and the employee provides proof of a hotel expenditure in a form satisfactory to the Contractor.

In the event an overnight stay is required because an employee is unable to leave Happy Valley-Goose Bay on the employee's turnaround because of a disruption in air travel, such employee may remain in the Accommodations Complex at no cost until air transportation from Happy Valley-Goose Bay is available.

The Association and/or Contractor shall provide ground transportation to and from the Site to the Happy Valley-Goose Bay airport.

Employees shall not be paid travel time.

Employees whose permanent residence is 100 kilometers or more from the designated airhead shall receive a payment equal to the travel zone payment set out in Article 25.08.

25.10 When an employee is laid off, the Contractor shall provide return air travel or a Travel Allowance consistent with Articles 25.08 and 25.09. Employees who quit or have their employment terminated for cause prior to the completion of the employee's Work Schedule may not be entitled to return air travel or Travel Allowance consistent with Articles 25.08 and 25.09.

25.11 For the purposes of this Article, all distances will be determined by a website used for measuring distances, which website will be agreed to by the Association and Council of Unions. A worker may appeal to construction management to have his/her travel distance reassessed.

Article 26 Wages and Benefits

26.01 All workers covered by this Agreement shall be paid in accordance with the classification in the applicable Trade Appendices attached as Schedule "D".

26.02 Payday shall be Thursday and the method of payment shall be by electronic deposit. A weekly Statement of Earnings and Deductions shall be issued to each worker on Thursday.

26.03 The Contractor shall remit contributions in an amount and manner as required by the applicable Trade Appendix. The remittance of these funds shall in no way require the Contractor to become or remain a member of any trustees' group or association as a condition for making these contributions

26.04 Changes to benefit contributions may be made at the request of a Union in writing, subject to the gross hourly package remaining unchanged. Such request to change benefit contributions may be made annually between April 1 and April 30 and shall be implemented no later than June 1.

26.05 The work week for payday purposes shall end on Saturday at midnight. Workers shall be paid on Thursday of the following week

26.06 The payment of wages shall be accompanied by a statement showing:

a) Wage rate;

b) Number of hours paid at the straight time rate of pay;

c) Number of hours paid at the overtime rate of pay;

d) Amount of premium and allowances;

e) Vacation pay;

f) Holiday pay;

g) The amount and purpose of each deduction;

h) Name of the Contractor issuing the payment;

i) The worker's name and payroll number;

j) The pay period;

k) Gross and net earnings; and

l) Pension contributions.

Article 27 Lower Churchill Project Premium

27.01 In recognition of the uniqueness of the Lower Churchill Project, its importance to the Province of Newfoundland and Labrador and the duration of the Project, workers shall receive a Lower Churchill Project Premium payment of three dollars and fifty cents ($3.50) per hour for all hours earned. Contractors shall pay the premium weekly. The premium is not part of the wage package and does not attract vacation pay and recognized holiday pay.

27.02 Upon layoff, workers shall receive the Lower Churchill Project Premium in their final pay.

Article 28 Resource Development Trades Council Industry Fund

28.01 The Contractor shall remit to the Council of Unions the sum of thirty cents ($0.30) per person per hour earned for all hours earned by all members of the bargaining unit covered by this Agreement, which amount shall be in addition to the gross hourly package set out in each Trade Appendix.

Article 29 Canadian Building Trades Fund

29.01 The Contractors shall remit to the Canadian Building Trades Fund five cents ($0.05) per person per hour earned for all hours earned by all members of the bargaining unit covered by this Agreement, which amount shall be in addition to the gross hourly package set out in each Trade Appendix.

Article 30 Termination of Employment

30.01 When an employee has been terminated or laid off while away from the Site, any personal belongings shall be shipped to his/her last known address, at the Employer's expense, unless previous arrangements have been made.

30.02 Contractors shall provide four (4) hours' notice or pay in lieu of notice to employees who are laid off. These four (4) hours are to be used for the purposes of picking up and returning the Contractor(s) tools, checking out of accommodations or in preparing his/her own tools for the next job.

30.03 Layoffs shall occur in reverse order of hiring priority described in Article 7. For greater clarity, the last worker laid off shall be Newfoundland and Labrador residents and layoffs shall be in compliance with the Benefits Strategy and hiring priority for qualified Labrador Innu, subject to the retained employees having the competence and qualifications necessary to complete the remaining work.

30.04 Workers who are laid off and for whom transportation is not available shall be entitled to receive accommodations until such transportation is made available by the Contractor.

30.05 In the event of a reduction of the workforce anyone promoted from journeyperson may be demoted to journeyperson. Anyone name hired as a foreman or general foreman shall be laid off as a foreman or general foreman.

Article 31 Tools

31.01 Workers are to supply appropriate tools in accordance with the schedules listed in the Trade Appendices attached to and made part of this Agreement.

The tools are subject to verification by the Contractor upon employment. If the Contractor deems other tools are necessary, they shall be supplied by the Contractor.

31.02 The worker's personal tools shall be in good condition when he/she is hired on the job and they shall be maintained and kept in good condition.

31.03 The Contractors will provide the appropriate lock-fast facilities for storage of personal tools.

31.04 Workers will be held responsible for tools, special and/or protective clothing and safety apparatus supplied to them by the Contractor. If the worker fails to return the supplied items in good condition to the Contractor, with the exception of fair wear and tear, at the time of termination or on request prior to the worker's termination, the replacement cost shall be deducted from any monies due to the worker.

Workers will not, however, be held responsible for loss or damage to Contractor supplied tools, clothing or equipment as a result of fire, theft due to break-in or forcible entry of Contractor arranged lock-fast facilities, provided the loss or damage is immediately reported by the worker, in writing, to the Contractor.

31.05 The Contractor shall replace a worker's personal tools when:

a) The tools are destroyed by fire, lost through theft by forced entry of a designated storage place on the Contractor's premises and provided that the loss or damage is immediately reported by the worker, in writing, to the Contractor; and

b) In the course of the worker's work assignment, the tools are damaged beyond repair, provided the worker satisfies his/her Contractor the damage was not intentional or caused by the worker's failure to exercise due care and attention.

31.06 Contractors will not be held responsible for personal tools which have not been identified on the worker's tool list by an authorized representative of the Contractor. The worker shall provide an inventory list and the Contractor shall conduct an inventory check prior to commencement of work.

31.07 A worker's tools which have to be replaced or sent off the job site for repair will be replaced and returned as soon as possible.

Article 32 Welding Testing

32.01 When welders are hired on the Project, the Contractor hiring the welder shall compensate the Union supplying the welder, five hundred and fifty dollars ($550.00) for each welding ticket the welder is required to have to perform the work. The welder shall be reimbursed four (4) hours pay for each ticket to compensate for time involved in completing each test. In the event a Union member is laid off and rehired by the Contractor or another Contractor working on Site, the Contractor or the other Contractor shall not be required to pay the five hundred and fifty dollars ($550.00) for each ticket and the welder shall not be reimbursed pay if the same welding tickets are required. The Contractor is responsible for the cost of Canadian Welding Bureau re-certifications if the certification expires more than one (1) year after the welder commences to work on Site. These re-certifications shall be without loss of pay to a maximum of one (1) regularly scheduled work day at straight time.

Article 33 Lunch Room and Sanitary Facilities

33.01 The Contractor shall provide and maintain clean, heated, sanitary facilities which shall include modern flush toilets, urinals and wash basins. Where this is not practicable, chemical toilets and pump tank facilities will be provided.

33.02 Fresh, safe drinking water and sanitary cups shall be provided to the workers.

33.03 The Contractor shall provide lunch rooms and determine their location subject to restrictions of the work area in which the employees may take their breaks and meals.

33.04 When lunch rooms are used, they shall be kept heated and clean, with adequate size and seating capacity to accommodate the number of people using the facility. General lunch rooms shall be provided with reasonable amenities, such as kettles and microwaves.

33.05 There shall be suitable heated warm-up shacks for drying clothes.

Article 34 Apprenticeship and Training

34.01 The Association, the Contractors, the Council of Unions and the Unions agree, in alignment with the Benefits Strategy and obligations to the Labrador Innu, to create training, development and apprenticeship opportunities.

34.02 The Association, the Contractors, the Council of Unions and the Unions agree to the utilization of apprentices as follows:

a) Not less than one (1) apprentice for every three (3) journeypersons; and

b) Not more than two (2) apprentices for each journeyperson.

34.03 Gender Equity and Diversity shall be a consideration when hiring or referring Apprentices to the Project as part of the Parties' cooperative effort to achieve and sustain participation rates for women and underrepresented groups established in consultation with the Province.

34.04 The employment of apprentices (within regulatory requirements and limitations) will be promoted throughout the duration of the Project and will provide for a spectrum of apprentices from the first year through the fourth year as appropriate to their respective trade(s). The Parties will facilitate this through the effective utilization of the hiring provisions contained in Article 7 of this Agreement.

Article 35 Leave of Absence

35.01 Workers shall be granted three (3) regularly scheduled work days leave with pay (the worker's regular rate times the number of hours the worker is scheduled to work on those days plus any applicable premium) commencing on the day after the date of death of the spouse or common law spouse, child (step child), parent (step parent), legal guardian, brother, sister, parent-in-law, grandparent, grandchild, daughter-in-law, son-in-law, sister-in-law, brother-in-law or other relative or dependant living in the same principal residence.

35.02 Bereavement leave shall not be granted for time that would not normally have been worked and under no circumstances shall pay be granted for unscheduled overtime missed as a result of a worker's absence.

35.03 Workers shall be entitled to pregnancy, maternity, parental and adoption leave in accordance with the provisions of the Newfoundland and Labrador *Labour Standards Act* in effect as of the date of this Agreement.

35.04 Workers summoned to attend upon a court of inquiry or any other judicial proceeding as a juror or prospective juror in accordance with the Newfoundland and Labrador Jury Act, 1991 shall be paid the same as they would if they had been scheduled to work.

35.05 The Contractor may grant a leave of absence without pay to any employee for personal or cultural reasons. Requests for such leave shall be made in writing at least one week in advance; such leave shall not be arbitrarily denied.

Article 36 Commissioning

36.01 Commissioning activities are important to the success of the Project. During the Commissioning process, the Owner, EPCM or Commissioning Contractor may utilize Union members, Owner employees or vendor representatives or Commissioning Contractor employees who are not members of the bargaining unit. Notwithstanding any other Article in this Agreement, Union employees required for Commissioning may be selected by the Owner, EPCM or the Commissioning Contractor from the Council of Unions' bargaining unit or out-of-work list and may be required to work in multi-disciplined Crews. Commissioning work executed by Union members shall fall within the scope of this Agreement. Commissioning work executed by Owner employees, vendor employees or representatives or EPCM employees or Commissioning Contractor employees who are not members of the bargaining unit shall fall outside the scope of this Agreement.

Article 37 Saving

37.01 Should any provision of this Agreement be found by a court of competent jurisdiction to be in conflict with any law or regulation of Canada or Newfoundland and Labrador, such provision shall be superseded by such law or regulation. Notwithstanding such invalidation, the remaining provisions shall remain in full force and effect.

37.02 Unless prohibited from doing so by such law or regulation or court ruling, the Parties shall commence negotiations within fourteen (14) days to provide a valid replacement of such provision.

37.03 In the event that negotiations do not result in agreement on a legal replacement for such provision within fourteen (14) days of commencement of negotiations or such longer period as may be mutually agreed, the matter shall be resolved in accordance with the arbitration process in this Agreement.

Article 38 Duration

38.01 This Agreement shall be for a term commencing on the later of:

a) Date of its signing; or

b) Date the Lieutenant Governor-in-Council issued a Special Project Order respecting the Project and continuing for the duration of the work at the Site, including mobilization and demobilization by the Contractors except as provided herein.

38.02 Without restricting the generality of the aforegoing, this Agreement ceases to apply when Mechanical Completion of the work is attained and is handed over to the Owner or its designate.

38.03 Mechanical Completion occurs when construction is physically complete (manufactured, fabricated, installed and connected), safe (related systems necessary for protection of personnel and property are in place), clean (flushed, clean and dry), tight (bolt tensioned, hydro tested and reinstated), inspected, tested and documented.

38.04 Notwithstanding Article 38.02, a unit(s), system(s) or area(s) may be deemed ready for acceptance by the Owner or its designate upon near completion. Upon acceptance, prior to Mechanical Completion by the Owner or its designate, this Agreement ceases to apply to that work.

38.05 Should the Owner or its designate require assistance from the Contractor in modifying, altering or fixing up any system or facility described above the work shall be performed by members of the Council of Unions.

Signed at St. John's, Newfoundland and Labrador this 14th day of March, 2013.

SCOPE OF WORK

Schedule “A.2”

SCOPE OF WORK

Scope of construction work that will be included will be as follows:

Designated quarries as per the Letter of Understanding, transportation of aggregate and till to the Site from the designated quarries, the construction of the Dams / Spillways, construction of the Powerhouse, construction of the Switch Yard at Muskrat Falls to the Anchor Bolts, the construction of foundation and envelope of the converter station building (structural steel, exterior cladding and roofing) at Muskrat Falls, bulk excavation of the Site for the Dam and Powerhouse, and construction and operation of the Accommodations Complex.

This scope of construction work does not include construction activities performed under another Special Project Order issued pursuant to Section 70 of the *Labour Relations Act* (as per Article 4.04(b)).

SCHEDULE “B”

JURISDICTIONAL UMPIRE – TERMS OF REFERENCE

Schedule "B"

JURISDICTIONAL UMPIRE – TERMS OF REFERENCE

SECTION I: DEFINITIONS

In this Agreement:

"Agreements between Unions" There are three types of Agreements – Agreements of Record, Attested Agreements and Non Attested Agreements. These Agreements are not binding on other crafts not signatory to the Agreements and, insofar as the Impartial Jurisdictional Disputes Board is concerned, they do not affect the claims or rights of work jurisdiction of Unions not parties to the Agreement.

"Agreements of Record" are those Agreements between Building Trades Unions which have been recorded with the Impartial Jurisdictional Disputes Board and are binding on the signatory Unions. These are the only Agreements contained in the "Green Book".

"Attested Agreements" are those Agreements signed by the General Presidents of two International Unions and attested to by the Impartial Jurisdictional Disputes Board. These Agreements have the same status as an Agreement of Record.

"Decision of Umpire" means the decision of work assignment made by the umpire.

"Decisions of Record" are those which appear in the publication commonly referred to as the "Green Book" published and approved by the Building and Construction Trades Department, AFL-CIO, (current issue), and are international or national in scope. They are applicable to all trades even though a dispute which resulted in a Decision of Record may originally have involved only two trades. They are not to be confused with job decisions rendered by the Impartial Jurisdictional Disputes Board which apply only to the job decisions. However, the Impartial Jurisdictional Disputes Board is required to give due consideration to Decisions of Record in arriving at job decisions. Decisions of Record in the "Green Book" do not appear in chronological order and are always referred to by dates.

"Impartial Jurisdictional Disputes Board" means the Impartial Jurisdictional Disputes Board in Washington, D.C., the International Appeal board, the International Plan for the Settlement of Jurisdictional Disputes in the Construction Industry (approved June, 1984, as amended December 2008), or its successor.

"Intended Work Assignment" means the initial step wherein the Contractor declares his intention to assign certain work to a certain trade(s).

"Jurisdictional Dispute" means dispute between Unions and/or Unions and a Contractor over the assignment of work, or a difference between two or more Unions as to which trade or which workmen will do certain work which must be grounded and be founded upon the scope or claimed jurisdiction as set forth in the International Constitution applicable to the Claimant(s).

"Non Attested Agreements" are those which have not been filed with the Impartial Jurisdictional Disputes Board, nor attested by the Chairman of the Impartial Jurisdictional Disputes Board.

"Participating Contractor" means a Contractor working under the terms and conditions of this Agreement.

"Participating Unions" means a Union which is a member of the Council of Unions.

"Prevailing Practice" is the practice of that craft which submits valid evidence indicating that its members have performed more of the work in the area where the dispute exists than have members of other crafts. The area, for the purpose of determining the Prevailing Practice, shall be defined ordinarily to mean the geographical jurisdiction of the Province of Newfoundland and Labrador.

"Specific Work Assignment" means the assignment of work as determined by the umpire. The "intended work assignment" shall be considered the specific assignment where the assignment remains unchallenged before the umpire.

"Umpire" means the Jurisdictional Umpire appointed pursuant to Article 17:00 of this Agreement.

SECTION II PROCEDURES TO BE USED BY THE UMPIRE

1. Agreements of Record and Decisions of Record established by or recorded by the Impartial Jurisdictional Disputes Board, prevailing practice as defined, established international trade practice, together with a reasonable acceptance of considerations for efficiency and capacity to furnish construction services to the public at reasonable cost, shall be accepted by the umpire as factors in assigning work (see Article 2.2(b) of the Procedural Rules of the Canadian Plan).

2. Decisions on Assignment of work (Reference Article 17.00) – When the umpire has received a claim of work assignment from the Council of Unions or for a request for a decision from the Association or Contractor, he/she shall proceed to make a decision as outlined below:

i) Any request for a decision shall contain the following information:

Name and address of the Contractor.

Disputing trades.

The assignment of work made by the Contractor.

A full and detailed description of the disputed work.

When the request is made by the Union, it shall also state the basis of its claim for the work.

ii) All requests for services of an umpire shall be made to the RDTC Office at 78 Brookfield Road, St. John's, NL.

iii) The Council of Unions shall file a copy of each request for a decision with the Association, the affected Contractor(s), the umpire and all of the Local Union(s) involved in the dispute.

iv) When notice of a request for a decision has been sent to a Union or Contractor directly affected, the Union or Contractor shall be allowed twenty-four (24) hours (except as provided below) in which to state its position to the umpire. The Union shall be notified of this period at the same time it is sent notice of the request for a decision.

v) Where a request for a decision has been filed with the umpire by the Council of Unions, the Association or Contractor shall be requested to furnish a full description of the disputed work.

vi) Where two Unions have established procedures for the adjustment of jurisdictional disputes without resorting to the procedures set out herein, they shall be allowed a reasonable length of time as determined by the umpire in which to effect a settlement which settlement much be approved by the Contractor. If the Unions are unable to reach agreement, they shall jointly render a statement of facts of the dispute to the umpire for a decision.

vii) When the umpire has decided to process a dispute in accordance with the provisions of Article 17, the Union and Contractor(s) involved and the Association shall be notified and allowed five (5) working days from receipt of the notice in which to submit evidence. The Unions shall be notified by registered mail, courier, or facsimile of this period in each case processed.

The notice must also include a clear definition of the dispute on which evidence is to be secured, and the locality from which evidence will be received which shall be the same for both trades and shall be the Province of Newfoundland and Labrador. The umpire will consider only evidence which identifies projects within the Province of Newfoundland and Labrador and the Contractor on the project. It is desirable wherever possible for the evidence to show the year the work was performed and the amount of work involved.

viii) If the umpire finds that the dispute is not covered by an appropriate or applicable Decision or Agreement of Record, he/she shall render a decision in which he/she shall consider the established and prevailing practices, in the Province of Newfoundland and Labrador specific to major projects, in the Province of Newfoundland and Labrador in other sections of the construction industry, Canada and the United States, in accordance with Section II 1) herein, and the decision shall be effective for the duration of the Project.

ix) The Council of Unions and the Association shall ensure that their members promptly comply with each decision of the umpire.

x) If, during the course of consideration of a dispute, the umpire should decide that there is a substantial and material question of fact which cannot be resolved on the basis of the available evidence, the umpire shall temporarily suspend the deliberation and make the investigation as he/she deems necessary to avail himself/herself of all facts and evidence bearing on the dispute.

xi) If, during the course of consideration of a dispute, any Party to the dispute or the umpire should decide that there is a substantial and material question of technological change attendant to a dispute which cannot be resolved on the

basis of available evidence, the umpire shall temporarily suspend the deliberations and make any investigation as he/she deems necessary to avail himself/herself of all facts and evidence bearing on the dispute and shall in any event make a decision prior to the scheduled commencement of work.

xii) In addition to all other requirements in these Rules and Regulations with respect to the form of a decision rendered by the umpire, it is also required that any decision shall include a brief statement of the description of the work in dispute and the conclusions of the umpire with respect to the principal material issues which are involved in the dispute. The umpire's written decision shall be as brief and concise as possible.

xiii) In keeping with the expressed intent of the Parties to address jurisdictional matters in a timely, efficient and cost effective manner, the hearing may be conducted by electronic audio/visual means.

xiv) Each Party to the jurisdictional dispute shall pay its own expenses in accordance with Article 17.11. The fees and expenses for the umpire shall be paid by the losing Party.

xv) Unless and until it is re-assigned by the umpire, work shall be performed in accordance with the Contractor's final mark up and the Contractor shall have no liability in respect of work subsequently re-assigned.

xvi) Once a decision is rendered by an umpire as to a work assignment in a mark-up, such work assignment shall not be the subject of review by an umpire for the same work assignment under a different mark up and contractors will be required to assign the work in future mark ups as per the decision of the umpire for the duration of the Project, provided that the work or the method of performing the work is the same or substantially the same as the work that was awarded by the umpire or contained in the different mark-up.

SECTION III IMPLEMENTATION OF DECISIONS

Decisions as to jurisdiction claims and decisions determining whether or not the decisions have been violated as rendered by the umpire shall be binding, final and conclusive on all of the Parties agreeing to the operation of this Jurisdiction Dispute Resolution Plan, except as otherwise provided in Section III.

To further implement the decision of the umpire, any Party, may, at any time, file a complaint in writing with the umpire alleging a violation of a decision previously made. The umpire shall thereupon set a hearing to be held within three (3) days of receipt of the complaint with respect to the alleged violation and shall notify, by registered mail or facsimile, all interested Parties of the time and place thereof. The umpire shall conduct a hearing at the time and place specified in this notice. All Parties shall be given an opportunity to testify and present documentary evidence relating to the said matter of the hearing within forty-eight (48) hours after the conclusion thereof. The umpire shall render a written decision in the matter and shall state whether or not there has been a violation of his/her prior decision. Copies of the decision shall be mailed by registered mail or facsimile to all parties thereto. Should the umpire determine that

there has been a violation of his/her decision, he/she shall order immediate compliance by the offending Party or Parties.

The umpire shall take the following action to enforce compliance with his/her decision including a directive to make a specific assignment of work.

a) He/she shall levy a fine of $250.00 per day for each violation against the offender, i.e. Contractor and/or Union, represented by the Parties hereto. The fine shall be paid to the Council of Unions and submitted to the affected Union or Unions consistent with the decision of the umpire. Should a member of either Party to this Agreement fail to pay the amount levied within fifteen (15) days, he/she shall be deprived of all benefits of the umpire until the time as the matter is adjusted to the satisfaction of the umpire.

b) He/she shall file an application in any court of competent jurisdiction to have his/her decision confirmed and for entry of a judgment in conformity therewith.

c) He/she shall take any further or additional action he/she deems necessary to secure compliance with his/her decision.

d) The umpire shall determine the losing Party in each case. If the Contractor or Association's final assignment is changed by the umpire, the Contractor or Association (whichever Party made the assignment) and the assigned trade are the losing Parties, and they shall equally share the umpire's fees and expenses. If the Contractor or Association's final assignment is not changed by the umpire, the claiming trades shall pay the umpire's fees and expenses.

SECTION IV RECOURSE

Any Party or person bound by a decision of the umpire may apply for a Jurisdictional award to the Canadian Plan, or its successor, created by the Building and Construction Trades Department, AFL-CIO, and the person or Party shall be bound by all of the Procedural Rules and Regulations of the said Canadian Plan, or its successor, except as amended by this Agreement, so far as may be applicable, and shall be bound by any Decision of the said Canadian Plan, or its successor (including any decision of the International Appeal Board provided herein) as if the decision were a decision of the umpire referred to in Section II.

4.0 UNIFORMS

4.01 Security – Section 1: Security personnel shall be provided with:

(a) Summer clothing to consist of safety footwear, two pants, three shirts, two jackets and rain gear.

(b) Winter clothing to consist of safety footwear, two pants, three shirts, leather gloves, one parka.

Uniforms shall have badges and decals clearly identifying security personnel. Alterations shall be the responsibility of the Employer.

4.02 Catering: All catering staff shall be supplied with:

(a) Three uniforms per employee (Kitchen, Whites) and (Camp Attendants, Blues) and safety footwear. Alterations shall be the responsibility of the Employer.

5.0 BULLETIN BOARDS

5.01 The Union shall use the Bulletin Board for notices of importance concerning Union business and the Company agrees that they shall use the Bulletin Board for any business concerning Union matters\, such as layoffs, hiring and recall.

6.0 SPLIT SHIFTS

6.01 Employees working a split shift shall be paid an additional two dollars and fifty cents ($2.50) per hour for all hours worked.

6.02 Employees required to work in excess of twelve (12) hours from commencement of their shift shall be paid overtime for all hours worked in excess of twelve(12).

6.03 There shall be one (1) split only in a split shift.

6.04 The split shift premium is not to be included in the base hourly rate when computing overtime.

7.0 SECURITY SPECIAL CONDITIONS

7.01 Notwithstanding Article 19 (Regular Work Schedule, Extended Work Schedule, and Overtime Provisions to Address Unique Project Needs) in the Agreement, the Crew Chief Security, Assistant Crew Chief Security, and Security workers may work a schedule of seven (7) consecutive twelve (12) hour shifts and seven (7) consecutive days off. The employee, when working this schedule, shall be paid one hundred and thirteen (113) hours at his/her straight time hourly rate of pay for such eighty-four (84) hours worked. Employees shall be paid sixteen point one four (16.14) hours for each regularly scheduled 12 hour shift worked on the 7 days on / 7 day offs Work Schedule. In the event that the employee does not work a regularly scheduled 12 hour shift on this work schedule, the amount paid to such employee shall be reduced sixteen point one four (16.14) hours for each day not worked on the Work Schedule. When working this schedule, the employee shall be paid the first fifty six and one-half (56.5) hours in the week worked (provided such employee worked each of the scheduled work days), and the other fifty six and one-half (56.5) hours in his/her week off (provided such employee worked each of the scheduled work days).

7.02 Notwithstanding Article 19 (Regular Work Schedule, Extended Work Schedule, and Overtime Provisions to Address Unique Project Needs) in the Agreement, the Crew Chief Security, Assistant Crew Chief Security, and Security workers may work a schedule of fourteen (14) consecutive twelve (12) hour shifts and fourteen (14) consecutive days off. The employee, when working this schedule, shall be paid two hundred and twenty six (226) hours at his/her straight time hourly rate of pay for such one hundred and sixty eight (168) hours worked. Employees shall be paid sixteen point one four (16.14) hours for each regularly scheduled 12 hour shift worked on the 14 days on / 14 days off Work Schedule. In the event that the employee does not work a

regularly scheduled 12 hour shift on this work schedule, the amount paid to such employee shall be reduced sixteen point one four (16.14) hours for each day not worked on the Work Schedule. When working this schedule, each of the two weeks such employee works (provided such employee worked each of the scheduled work days), the employee shall be paid fifty-six and one-half (56.5) hours, and fifty-six and one-half (56.5) hours each of the weeks in his/her two weeks off (provided such employee worked each of the scheduled work days).

8.0 CASUAL WORKERS

8.01 Casual workers may be procured by the employer and shall be hired to replace full time workers who are on vacation, have approved leave of absence, off due to illness, or replacements for no-shows. Casual workers shall be referred by the Union after being notified by the Contractor of the identity of the casual workers the employer wishes to hire.

8.02 Casual workers shall be advised that no assurance is given or assumed that they shall be promoted by the Contractor to a full time position.

8.03 Casual workers shall pay three percent (3%) working dues only.

9.0 ASSISTANT CREW CHIEFS

9.01 Assistant Crew Chiefs shall be Working Forepersons when supervising a crew of four (4) employees or less, whether or not there is a Crew Chief. Once a crew exceeds four (4) employees, the Assistant Crew Chief shall be Non-Working.

10.0 LOWER CHURCHILL PROJECT PREMIUM ALLOCATION

10.01 The Lower Churchill Project Premium paid pursuant to Article 27 of the Agreement shall be allocated as follows:

(a) Two dollars and fifty cents ($2.50) for each hour earned to be paid into the Employees' Registered Retirement Savings Plan to the Benefit Plan Administrator in accordance with 3.03(a) monthly.

(b) One dollar ($1.00) for each hour earned to be paid weekly.

Address: Business Manager, F.S.T.
Ironworkers Local Union 764
38 Sagona Avenue
Donavan's Industrial Park
Mount Pearl, NL A1N 4R3

5.0 APPRENTICES

5.01 Where Apprentices are employed, the Contractor shall pay wages in accordance with this Agreement, and will not be compelled, under any circumstances, to pay the Journeyperson rate of pay. However, the Union recognizes the fact that the Contractor may, after consultation with the Union, increase the rate of pay for Apprentices that have demonstrated the ability to perform work at the next Apprenticeship level. When the Apprentice has completed his four thousand (4,000) hour program, he shall appear before the examining board of the Local Union and be required to pass a test before receiving his/her Journeyperson Ironworkers card.

6.0 TOOLS

6.01 Employees shall furnish, for their own use, standard hand tools to enable them to effectively perform their work.

7.0 HEALTH AND SAFETY

7.01 Every employee shall, as a condition of employment, own and wear suitable protective footwear and other personal equipment required in the normal course of his duties. On abnormally dirty or corrosive work, suitable coveralls, rubber gloves and rubber boots shall be provided when necessary; (not to include normal re-bar work), but including post tensioning and pre-stressing work.

7.02 Safety Harness and Double Lanyard with shock absorbers shall be signed for by employee and if not returned, then the employee shall pay the cost for the same.

7.03 On multi-storied erection projects, and on floors where employees are required to work, not more than two (2) floors or a distance of thirty (30) feet shall remain uncovered without suitable planking, decking or netting that is properly secured. The perimeter of the working floors shall have protection consisting of wire rope.

7.04 *Stiffening and Supporting Working Load Points*: Where iron is landed on the floor or any point of a structure under construction all connections shall be fully fitted and tightened and substantial supports provided to safely sustain such added weight.

7.05 *Riding The Load Fall*: No employee shall be permitted to ride the load. Riding the load fall shall not be allowed except for emergency reasons as determined by the foreperson and not more than two (2) employees any one time.

7.06 *Slings*: Steel cable will be used instead of chains or hemp slings. Slings using a ferruled eye instead of an open sliced eye shall have a Flemish splice in the eye with the ferrule. All slings shall be inspected weekly and slings with wires broken or cut off shall be destroyed by cutting in two (2) pieces. When floats or suspended scaffolds are used by workers using torches or welding equipment, fibre rope shall not be used to suspend such floats. Wire rope with a minimum 3/8" diameter shall be used.

7.07 *Protection of Signal Devices*: Proper practical safe housing, casing or tube shall be provided for any and every means, method, appliance or equipment to transmit or give

signals, directing work or operation or any and various devices in connection with work being done by employees.

7.08 *Overhead Crane Protection*: No employee shall be permitted to work on cranes rails unless safety provisions are taken regarding hot rails or crane operation while work is being performed.

7.09 *Operational Equipment*: To properly secure any or all operational controls two (2) key type locking devices shall be used. Such keys shall be divided between operating management and the foreperson supervising the crew.

7.10 *Blind Lifts*: When the vision of employee is impaired during the course of erection or hoisting of materials, and an adequate audio signal device is not available, and extra employee shall be employed to act as a signalperson.

8.0 IRONWORKERS REQUIRED ON CRANES

8.01 On all mobile or power operated rigs of any description utilized for heavy steel erection in the construction of a building, no less than four (4) employees and a foreperson shall be employed (this article is not applicable to boom trucks).

9.0 HEIGHT PAY

9.01 The premium above the regular hourly rate shall be paid to workers required to work at heights under such conditions: temporary staging, scaffolding, tower like structures or structures with a direct drop of forty (40) feet or more shall receive one dollar ($1.00).

1. Resource Development Council Industry Fund - Contractor shall remit the RDC Industry Fund ($0.30/hour earned) as per Article 28
2. Canadian Building Trades Fund - Contractor shall remit the Canadian Building Trades Fund ($0.05/hour earned) as per Article 29
3. Lower Churchill Project Premium - Contractor shall pay the Lower Churchill Project Premium ($3.50/hour earned, paid weekly) as per Article 27

INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS AND LOCAL UNION 1620

1.0 APPLICATION

1.01 This Trade Appendix shall apply to the following:

General Foreperson
Foreperson
Lead Lineperson
Journey (Lineperson and/or Cable Splicer)
Apprentices
Utility Worker

1.02 A lead lineperson is a journeyperson having charge of not more than four (4) other tradespersons, whether journeypersons, ground persons, or apprentices, or not more than twelve (12) utility workers. Only lead linepersons, journeypersons and / or apprentice linepersons shall be allowed to frame poles on the ground.

A Foreperson shall be appointed when supervising more than four (4) other tradespersons whether journeypersons, ground persons, or apprentices, or more than twelve (12) utility workers. A Foreperson shall not work with the tools of the trade when he/she supervises more than six (6) employees.

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be thirteen (13%) percent of gross wages including over-time for all employees, paid to the Union Office on the 15th of the following month, along with a list of names and amounts for each employee to the Union Office address below.

Address: IBEW Local 1620
67 LeMarchant Road
St. John's, NL A1C 2G9

Cheque payable to: Vacation Pay Trust Fund

3.0 BENEFIT FUNDS

3.01 The Contractor shall remit the amounts in the attached Wage and Benefit Schedule for each hour earned. Payments shall be made no later than the 15th of the month following the month in which the hours were earned.

3.02 Each payment shall be accompanied by a statement setting out the names of the employees in respect of whom such payment is made, the amount paid in respect of each employee and the hours worked by each employee during the calendar month for which payment is being made.

3.03 Payments shall be made to the following addresses:

(a) Health and Welfare Fund

Address: Benefit Plan Administrators
7001 Mumford Road, Suite 216
Halifax, NS B3L 4N9

Cheque payable to: IBEW Local 1620 Health and Welfare Benefit Trust

(b) Pension Fund

Address: Benefit Plan Administrators
7001 Mumford Road, Suite 216
Halifax, NS B3L 4N9

Cheque payable to: IBEW Local 1620 Pension Trust Fund

(c) Training and Scholarship Fund

Address: Benefit Plan Administrators
7001 Mumford Road, Suite 216
Halifax, NS B3L 4N9

Cheque payable to: IBEW Local 1620 Training and Scholarship Fund

(d) Industry Fund (RDTC)

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque payable to: Resource Development Trades Council Industry Fund

(e) Canadian Building Trades Fund

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Canadian Building Trades Fund

4.0 UNION DUES

4.01 Union Dues as per Article 6 shall be forwarded to the following address:

Address: IBEW Local 1620
67 LeMarchant Road
St. John's, NL A1C 2G9

5.0 APPRENTICES

5.01 Except in the interest of safety, as stated below, the ratio of apprentices on hot line crews will be one (1) on every three (3) person truck and two (2) per truck on large crews subject to clearance from Newfoundland Light & Power Company Limited and Newfoundland & Labrador Hydro.

5.02 In the interest of safety, and in accordance with the Operating Lineperson's Program of Training, no first year apprentices will work on a hot line crew, no second year apprentices will work with a hot line crew working above 300 volts. Third and fourth year apprentices will work on live lines under the supervision of a qualified journeyperson.

5.03 The Contractor agrees to cooperate to the fullest extent with any government instituted Apprenticeship Training Plan including the granting of time off for yearly in school training where requested by the employee or the Department of Human Resources, Labour and Employment.

5.04 The Contractor further agrees to endeavour to do all in their power to see that apprentices are given the necessary work experience as outlined in the Operating Lineperson's Course.

5.05 Apprentices who have attained a certificate in the linesperson's pre-employment course will be credited with six (6) months towards their apprenticeship (first year) and shall be paid first year rate for the remaining six (6) months.

6.0 TOOLS

6.01 Employees will supply one each of the following tools:

Belt & Pole Strap
Hooks, Pads and Straps
10" Crescent Wrench
12" Crescent Wrench
Set Ratchet and Sockets (½" Drive)
Ball Peen Hammer (2 lbs.)
9" Klien Pliers
Hand Line (other to be supplied by the Contractor)
Straight End Screwdriver (14")
Skinning Knife
3' Wooden Rule (all others to be supplied by the Contractor)
Non-Metallic Tape Measure (all others to be supplied by the Contractor)
Line Level
Spud Wrench (15/16")

INTERNATIONAL UNION OF OPERATING ENGINEERS
AND LOCAL UNION 904

1.0 APPLICATION

1.01 This Trade Appendix shall apply to the following:

Operator Group 1:

Engineers operating: mobile or crawler cranes, clams, draglines, skyhorse and ringer type cranes with a manufacturer's rating of 50 tons capacity and over. Also, tower crane operators, certified divers, heavy duty Mechanics and Welders.

Operator Group 2:

Engineers operating: skyway, climbing, hammerhead and kangaroo type cranes, boat operators with ticket, 1st. class stationary engineers, backhoes, excavators, shovels, gradalls, graders, bulldozers, front end loaders, boom trucks, mobile truck cranes including gallion and austin-western type, and all rough terrain type hydraulic cranes, overhead cranes, pile drivers, caisson boring machines, drill rigs, pittman type cranes of 12 tons capacity and over, hydrovac operator, vacuum truck operator.

Operator Group 3:

Engineers operating: asphalt roller, skid steer (bobcat), dredges-suction and dipper, gantry cranes, creter cranes, side booms, power hoist, mine hoist, chimney hoist, tower type man and materials hoists, 2nd. class stationary engineers, telehandler (zoom boom), forklifts, off highway truck, fifth wheel truck, truck over 10 tons and operators of batching and crushing plants.

Operator Group 4:

Operators of: bullmoose, pittman type cranes of less than 12 tons capacity, air tuggers, air compressor feeding low pressure into air locks, tractors, scrapers, emcos, overhead and industrial tractors with attachments, trenching machine, mucking machines, mobile pumpcretes, side loaders, end booms, mobile pressure grease units, elevators, dinky locomotive type engines, boat operators without tickets and 3rd. class stationary engineers, mechanic's helper, serviceman, concrete pump operator, block accerate mixer.

Operator Group 5:

Operators of 6" discharge pumps and over, wellpoint systems and all other types of dewatering systems, concrete mixers of one cubic yard and over, portable air compressor over 150 C.F.M., "A" Frames, post hole augers, gas, diesel or steam driven generators over 50 H.P. (portable), and 4th. class stationary engineers. Operators of: rollers on grade work, driver mounted compaction units, concrete conveyors, and concrete pumps. Firemen and attendants for forced air, gas or oil burning temporary heating units of 500,000 BTU or over per hour; or five or more heating units of the same job site, signalman, pumps under 6" discharge where 3 or more pumps are employed on the same job site, driver mounted power sweeper, truck crane oiler drivers, oilers, bus driver.

Clerical Group 1:

Office Assistant. Receptionist, Typist, Clerk I
(All office equipment other than computers)

Clerical Group 2:

Clerk II, Administrative Assistant, Document Control
(Includes computers)

Clerical Group 3:

Payroll Clerk, Senior Clerk, Senior Administrative Assistant

1.02 Foreperson

There shall be the following classes of Foreperson:

Working Foreperson (as per Article 7.08(a)(iv))
Non-working Foreperson
General Foreperson

1.03 Foreperson

Working / Non-Working Foreperson – Working and Non-Working Foreperson shall receive a premium of fifteen (15%) percent over the hourly rate of the highest Operating Engineer classification under their supervision.

General Foreperson – The General Foreperson shall receive a premium of twenty (20%) percent over the hourly rate of the highest operating engineer classification under his/her supervision.

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be thirteen (13%) percent of gross wages including over-time for all employees.

3.0 BENEFIT FUNDS

3.01 Each Contractor shall contribute the amounts stated in the attached Wage and Benefit Schedule for each hour earned. Payments shall be made no later than the 15th of the month following the month in which the hours were earned.

3.02 Each payment shall be accompanied by a statement setting out the names of the employees and Social Insurance Numbers (SIN) in respect of whom such payment is made, the amount paid in respect of each employee, and the hours worked by each employee during the calendar month for which payment is being made.

3.03 Payments shall be made as follows:

(a) Health and Welfare Plan

Each payment shall be made by a cheque made payable to:

Address: O.E. Local 904 Trust
PO Box 96
St. John's, NL A1C 5H5

(b) Pension Plan

Each payment shall be made by a cheque made payable to:

Address: O.E. Local 904 Trust
PO Box 96
St. John's, NL A1C 5H5

(c) Training & Promotional Fund

Each payment shall be made by a cheque made payable to:

Address: Operating Engineers Training & Promotional Fund
62 Commonwealth Avenue
Mount Pearl, NL A1N 1W8

(d) Membership Benefit Fund

Each payment shall be made by a cheque made payable to:

Address Operating Engineers Membership Benefit Fund
62 Commonwealth Avenue
Mount Pearl, NL A1N 1W8

(e) Charity Fund

Each payment shall be made by cheque made payable to:

Address: Operating Engineers Charity Fund
62 Commonwealth Avenue
Mount Pearl, NL A1N 1W8

(f) Industry Fund (RDTC)

Each payment shall be made by cheque made payable to:

Address: Resource Development Trades Council Industry Fund
78 Brookfield Road
St. John's, NL A1E 3T9

(g) Canadian Building Trades Fund

Each payment shall be made by cheque made payable to:

Address: Canadian Building Trades Fund
c/o Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

4.0 UNION DUES

4.01 Union Dues shall be deducted at the following rate:

(a) Working dues – 3.5% of the employee's gross income
(b) Monthy dues - $22.00 per month (identifying both deductions separately on report)

4.02 Union Dues as per Article 6 shall be forwarded to:

Address: Operating Engineers Local 904
62 Commonwealth Avenue
Mount Pearl, NL A1N 1W8

5.0 APPRENTICES

5.01 The Contractor, the Council of Unions and the Unions agree, to Project conditions and law, to maximize placement and utilization of apprentices as follows:

a) Not less than one (1) apprentice for every three (3) journey persons; and
b) Not more than two (2) apprentices for each journey person

5.02 Apprenticeship Rates and Other Conditions

The following scheme of remuneration shall apply for all apprentices:

1st	1000 hrs. --- 60% of Group 2 Rate
2nd	1000 hrs. --- 65% of Group 2 Rate
3rd	1000 hrs. --- 70% of Group 2 Rate
4th	1000 hrs. --- 75% of Group 2 Rate
5th	1000 hrs. --- 80% of Group 2 Rate
6th	1000 hrs. --- 90% of Group 2 Rate

5.03 A period shall be defined as six (6) months or one thousand (1000) working hours, whichever is greater.

5.04 Where an Apprentice is not available then an Oiler or Oiler Driver shall be utilized.

5.05 Utilization of Apprentices / Manning of Cranes

(a) The following formula will be used for the purpose of manning certain equipment set out in the classifications. It is further agreed that this formula shall only apply to employers covered by this Agreement.

The following shall be manned by one (1) operator and one (1) apprentice, oiler and oiler driver;

(i) All conventional truck mounted or crawler cranes with a manufacturer's rating of 25 tons capacity and over.

(ii) All truck mounted hydraulic and rough terrain type cranes with a manufacturer's rating of 100 tons capacity and over.

(iii) All clams and draglines with a capacity over 1 ¾ cubic yards (excavators and shovels are excluded from Article 5.05(a)(iii) herein for the Lower Churchill Muskrat Falls Project Agreement only).

(b) The following shall require one apprentice, oiler or oiler driver, for each two (2) pieces of equipment.

(i) Climbing, tower, traveler, hammerhead, skyway, Kodiak and kangaroo type cranes.

(c) The following shall require one apprentice, oiler and oiler driver, for each four (4) pieces of equipment;

(i) All truck mounted hydraulic and rough terrain type cranes with a manufacturer's rating between thirty (30) and one hundred (100) tons capacity.

(ii) Shovels, clams and draglines with a manufacturer's capacity of 1 ¾ cubic yards and under.

It is recognized that the moving (driving) and oiling of any equipment coming within the jurisdiction of the Operating Engineers, is work of the Operating Engineers. No operator shall be required to move a machine using the assistance of another trade on the machine.

6.0 SPECIAL CONDITIONS

6.01 Overtime Operations

If an Operator is regularly assigned to a machine from Monday through Friday in a given week and productive Work is required after the normal hours of work or on the Saturday, Sunday or holiday of that week, such Operator will be assigned to such particular machine for such Saturday, Sunday or holiday work.

6.02 Owner Operated Equipment

Owner Operated equipment performing work on the project shall be subject to the terms and conditions of the Agreement. Each Contractor shall advise the Council when Owner Operated Equipment is being contracted.

6.03 Heavy Lifting

Four ($4.00) dollars per hour worked premium will be paid to operators of cranes from 225-300 tons. An additional thirty ($0.30) cents per hour worked will be paid to the operator for every 50 tons thereafter (i.e. 450 ton crane + $4.90 premium).

6.04 Boom Premium

A boom premium of one dollar and fifty cents ($1.50) per hour worked shall be paid to crane operators operating cranes with a boom of 140-200 ft.

A boom premium of two dollars ($2.00) per hour worked shall be paid to crane operators operating cranes with a boom in excess of 200 ft.

Cranes that carry jibs that are stowed, stored and not in use, would not apply to a premium, until such lengths are equipped and in use.

A telescopic hydraulic crane equipped with 140 – 200 ft. main boom, the premium shall apply regardless of the boom length in use. It may be main boom or a combination of main boom and jib that the total length applies.

A telescopic hydraulic crane equipment with more than 200 ft. main boom, the premium shall apply regardless of the boom length in use.

6.05 Equipment Assembly

It is agreed that the assembling and dismantling of the Contractor's construction equipment described in the Classification or falling within the jurisdiction of the Operating Engineers, will be performed by members of the Operating Engineer's Union.

7.0 HEALTH AND SAFETY

7.01 The Contractor will provide, without cost, safety hats, rain coats, rubber boots, welding helmets, safety goggles, work gloves, coveralls, and safety equipment for high voltage work for the use of employees. The employee will sign for such equipment supplied by the Contractor and authorize deductions of the cost from his/her wages if he/she does not return such equipment in good condition, subject to reasonable wear and tear when they are returned. Employees who fail to observe and practice the established safety and working rules of the Contractor shall be subject to disciplinary action.

8.0 OWNER / OPERATORS – MANNED RENTED EQUIPMENT

8.01 Owner operated and manned rented equipment shall in no way be used to circumvent the intentions and provisions of this Agreement. Where an “Owner/Operator” performs

work for which they have been engaged, they shall thereafter become an employee and be entitled to all of the provisions of this Agreement.

8.02 The Contractor agrees that they will not, under any circumstances, engage an Owner/Operator to perform work for them unless, and until, the Owner/Operator, prior to the commencement of such work obtains from the Union, a clearance or permit to perform such work.

9.0 EPCM

9.01 The document control persons employed by the Owner's EPCM Agent working in non-confidential positions shall be included in the bargaining unit and paid the appropriate Clerical Group Rate. All other clerical staff in confidential positions shall remain outside of the bargaining unit and shall not perform bargaining unit work.

10.0 TOOL LIST

10.01
1) ¼ Drive set standard and metric including ratchet and extensions
2) 3/8 Drive set up to 7/8 socket standard and metric including ratchet and extensions
3) Combination wrench set from ¼ to 1 ¼ and 5mm to 30mm
4) ½ Drive socket set from 3/8 to 1 ¼ shallow and deep including ratchet and extensions
5) ½ Drive metric socket set from 10mm to 30mm
6) Punch and chisel set
7) Various pliers, side cutters, water pump pliers, vise grip, wire crimpers, long nose pliers
8) Pry bar set
9) Various ball peen hammers
10) Volt meter, test light
11) Crow feet socket set from 3/8 to 15/16
12) 3/8 drive air ratchet, ½ drive air impact
13) Complete set of screwdrivers
14) Allan wrenches metric and standard
15) Torques bit socket set and screwdrivers
16) Line wrenches from 3/8 to ¾ inclusive
17) ½ Drive impact sockets 3/8 to 1 ¼
18) ½ Drive impact swivel socket set ½ to 15/16

10.02 Tool Premium of one dollar and fifty cents ($1.50) per hour worked.

GROUP 3 Single Axle

Bombardier, nodwell driver, track truck, farm type tractor, preheat truck, pick-up or car (except when used by supervisory personnel, office staff, and field engineering crews) pilot car, fuel truck helper, fuel pump attendants and small boat operators.

GROUP 4 Warehouse personnel

GROUP 5 Primary Care Paramedic

GROUP 6 Registered Nurse and Fire Prevention Officer

GROUP 7 Owner/Operators

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be thirteen percent (13%) of gross wages including overtime for all employees.

3.0 FOREPERSONS

3.01 Working Foreperson: When the Contractor works the first eight (8) workers on any one shift, one of these workers shall be appointed a Working Foreperson.

Where the Contractor works the second eight (8) workers on any one shift, one of these workers shall be appointed a Working Foreperson.

The Working Foreperson shall receive a premium of one dollar and fifty cents ($1.50) per hour over the hourly rate of the highest classification under his/her supervision.

3.02 Non-Working Foreperson: Where the Contractor works more than sixteen (16) workers on any one shift, one of these workers shall be appointed a Non-working Foreperson.

The Non-working Foreperson shall receive a premium of one dollar and fifty cents ($1.50) per hour over the hourly rate of the highest classification under his/her supervision.

3.03 Foreperson: Where three (3) or more pieces of equipment are worked on any one shift, all equipment shall be under the supervision of a Foreperson. At the Contractor's discretion, he/she may be a driver.

3.04 General Foreperson: Shall receive a premium of two dollars ($2.00) per hour over the hourly rate of the highest classification under his/her supervision.

4.0 BENEFIT FUNDS

4.01 The Contractor shall remit the amounts in the attached Wage and Benefit Schedule for each hour earned. Payments shall be made no later than the 15th of the month following in which the hours were earned.

4.02 Each payment shall be accompanied by a statement setting out the names of the employees in respect of whom such payment is made, the amount paid in respect of each employee, and the hours worked by each employee during the calendar month for which payment is being made.

4.03 Payments shall be made as follows:

(a) Health and Welfare Fund

Address: Global Benefits
88 St. Regis Cres S
Toronto, ON M3J 1Y8

Cheque payable to: Teamsters Local 855 Health and Welfare Trust Fund

(b) Pension Fund

Address: Industrial Alliance
238 Brownlow Avenue, Suite 320
Dartmouth, NS B3B 1Y2

Cheque payable to: Industrial Alliance/Teamsters Local 855 Pension Plan

(c) Teamsters Building Fund

Address: Teamsters Union Local 855
PO Box 1472, Stn. C
St. John's, NL A1C 5N8

Cheque payable to: Teamsters Local 855 Teamsters Building Fund

(d) Advancement Fund

Address: Teamsters Union Local 855
PO Box 1472, Stn. C
St. John's, NL A1C 5N8

Cheque payable to: Teamsters Local 855 Advancement Fund

(e) Industry Fund (RDTC)

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Resource Development Trades Council Industry Fund

(f) Canadian Building Trades Fund

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Canadian Building Trades Fund

5.0 UNION DUES

5.01 Union dues shall be forwarded and payable to:

Address: Teamsters Local 855
PO Box 1472, Stn. C
St. John's, NL A1C 5N8

6.0 TOOLS

6.01 Mechanics shall provide and maintain hand tools necessary to the job.

7.0 OWNER/OPERATORS (GROUP 7)

7.01 The following provisions make up the way in which a Contractor or Sub-Contractor working under the Project Agreement fulfills its requirements for Dump Trucks.

1. Contractors or Sub-Contractors may provide their own trucks and the Union shall dispatch qualified Drivers who will be paid in accordance with the terms of the Collective Agreement.
2. Contractors or Sub-Contractors working under the Project Agreement may request Dump “Trucks from Contractors who are signatory to the Teamsters CLRA Agreements and payment shall be paid the appropriate Group 7 Dump Truck hourly rate as per Schedule A or as adjusted from time to time as per Schedule B paragraph 2.

3. Contractors or Sub-Contractors working under the Project Agreement may hire Owner/Operators directly as per Schedule B.

8.0 WAREHOUSE APPRENTICESHIP RATES

8.01 The Teamsters will establish apprenticeship rates which shall be as follows:

(a) 70% of the Warehouse Person's current hourly rate for hours worked from 0 – 1,000;

(b) 80% of the Warehouse Person's current hourly rate for hours worked from 1,001 – 2,000;

(c) 90% of the Warehouse Person's current hourly rate for hours worked from 2,001 – 3,000; and

(d) 100% of the Warehouse Person's current hourly rate for hours worked in excess of 3,000 hours;

PRIMARY CARE PARAMEDICS, REGISTERED NURSES AND FIRE PREVENTION OFFICERS SUPPLEMENT TO TEAMSTERS TRADE APPENDIX

1.0 APPLICATION

1.01 This supplement shall apply to the following:

Primary Care Paramedic
Registered Nurse
Fire Prevention Officer (if fulltime person is required)

1.02 Fire Prevention Officer(s) will be hired if a Contractor determines a fulltime Fire Prevention Officer is required.

2.0 BENEFITS

2.01 All employees under this Supplement will participate in the Union's benefit package which includes Group Insurance and Pension.

3.0 PRIMARY CARE PARAMEDICS AND REGISTERED NURSES SPECIAL CONDITIONS

3.01 Notwithstanding Article 19 (Regular Work Schedule, Extended Work Schedule, and Overtime Provisions to Address Unique Project Needs) in the Agreement, the Primary Care Paramedics and Registered Nurses may work a schedule of seven (7) consecutive twelve (12) hour shifts and seven (7) consecutive days off. The employee, when working this schedule, shall be paid one hundred and thirteen (113) hours at his/her straight time rate of pay for such eighty-four (84) hours worked. Employees shall be paid sixteen point one four (16.14) hours for each regularly scheduled 12 hour shift worked on the 7 days on / 7 days off Work Schedule. In the event that the employee does not work a regularly scheduled 12 hour shift on this Work Schedule, the amount paid to such employee shall be reduced sixteen point one four (16.14) hours for each day not worked on the Work Schedule. When working this schedule, the employee shall be paid the first fifty six and one-half (56.5) hours in the week worked (provided such employee worked each of the scheduled work days), and the other fifty six and one-half (56.5) hours in his/her week off (provided such employee worked each of the scheduled work days).

3.02 Notwithstanding Article 19 (Regular Work Schedule, Extended Work Schedule, and Overtime Provisions to Address Unique Project Needs) in the Agreement, the Primary Care Paramedics and Registered Nurses may work a schedule of fourteen (14) consecutive twelve (12) hour shifts and fourteen (14) consecutive days off. The employee, when working this schedule, shall be paid two hundred and twenty six (226) hours at his/her straight time hourly rate of pay for such one hundred and sixty eight (168) hours worked. Employees shall be paid sixteen point one four (16.14) hours for each regularly scheduled 12 hour shift worked on the 14 days on / 14 days off Work Schedule. In the event that the employee does not work a regularly scheduled 12 hour shift on this Work Schedule, the amount paid to such employee shall be reduced sixteen point one four (16.14) hours for each day not worked on the Work Schedule. When

working this schedule, each of the two weeks such employee works (provided such employee worked each of the scheduled work days), the employee shall be paid fifty-six and one-half (56.5) hours, and fifty-six and one-half (56.5) hours each of the weeks in his/her two weeks off (provided such employee worked each of the scheduled work days).

Schedule "B" – Owner / Operator
Terms and Conditions of Retention

1. The purpose of this Schedule is to set out the terms and conditions for Contractor(s) to retain Owner/Operator trucks ("Equipment") to work on the Project. If there is a conflict between the terms and conditions contained in Articles 1 to 38 of the Agreement and the terms and conditions of this Schedule, the terms and conditions in this Schedule shall prevail.

2. The total compensation and benefits, paid to Owner/Operators for Equipment shall be, as of the date of ratification, as per Schedule A Group 7 attached hereto, (the "Owner/Operator Compensation"). The Owner/Operator Compensation shall be determined prior to the commencement of work by Owner/Operators and may be changed at any time during the term of this Agreement, after consultation with the Union, and subject to the prior written approval of the Association. Owner/Operators shall not be entitled to any financial compensation and benefits as contained within the Agreement, except as provided for in this Schedule "B".

3. Owner/Operator, for the purposes of the Agreement, shall mean any person who owns, leases or rents and operates equipment who has been retained by a Contractor to work on the Project. Person, for the purposes of this Schedule, shall include any individual, firm, business, partnership or corporate entity that owns, leases or rents the Equipment that has been retained by the Contractor, which individual, firm, business, partnership or corporate entity is controlled by the person who operates the Equipment.

4. Notwithstanding Article 7.07 of this Agreement or any other provision of the Agreement, the retention of Owner/Operators shall be done at the sole discretion of each Contractor. In exercising its discretion, each Contractor must be in compliance where required with the Benefits Strategy and where required shall give preference in hiring to qualified Innu Owner/Operators.

5. Notwithstanding Article 30 of the Agreement or any other Article, a Contractor may discontinue the services of an Owner/Operator at any time.

6. All Owner/Operators will be represented by the Union as per Article 6. Prior to commencing work the Contractor shall provide the name, address and social insurance number of the Owner/Operator to the Union.

7. Articles 7, 10, 19 - 27, 30 - 32, and 34 - 38 of the Agreement shall not apply to Owner/Operators.

8. All work shall be performed and equipment operated in accordance with the *Occupational Health and Safety Act*.

9. The hours of operation of Equipment for Owner/Operators shall be determined by the Contractor and subject to the approval of the Association.

10. The Contractor shall save the Association and Union harmless from any and all causes of action, claims or demands of any nature or kind, including but not limited to expenses, costs, legal fees and disbursements, that may be made against the Union and/or Association for amounts due and owing by the Contractor to the Owner/Operator.

11. The Contractor may, subject to the prior written approval of the Association, develop policies, procedures, rules, regulations, working conditions, terms or standards in relation to the Equipment and the Owner/Operator's work on the Project (collectively referred to as the "Owner/Operator Regulations") which may be amended from time to time, subject to the prior written approval of the Association. The Owner/Operator Regulations shall include but are not limited to the following:

    a) Owner/Operators shall comply with all site standards, rules, regulations, policies and procedures as developed and amended by the Association from time to time.

    b) Contractor(s) may provide fuel to Owner/Operators, which fuel and delivery costs may be deducted from the Owner/Operator Compensation.

    c) The Contractor(s) shall have the right to require an inspection(s) of Equipment before Equipment comes onto a Project work site and/or an Owner/Operator commences work or at any time during the Project. Any Equipment not in good working condition will not be permitted on a work site and/or will not be permitted to commence work or continue to work. All Equipment must be equipped with back up alarms, flashing lights or any other equipment or device required by Occupational Health & Safety legislation or other applicable provincial legislation, the Contractor and/or Association.

    d) Owner/Operators shall maintain, with each piece of Equipment, a fire extinguisher, first aid kit or any other safety devices required by Occupational Health & Safety legislation or other applicable provincial legislation, the Contractor and/or Association.

    e) Owner/Operators can request the Contractor to do normal routine maintenance from any maintenance facility on the Project, (eg. belts, hoses, tires). Subject to available facilities and resources on the Project, the Contractor may provide these services to Owner/Operators. The labour and all other costs or expense associated with all repairs and/or maintenance will be charged to each Owner/Operator and deducted from the Owner/Operator Compensation. Owner/Operators are responsible for all repair and maintenance costs.

    f) Owner/Operators will be required to obtain a medical assessment as determined by the Association from time to time, prior to commencing work on the Project and shall be required to comply with all Project safety standards, policies, procedures, rules and regulations as determined by the Association. The Contractor shall pay the reasonable costs of the medical assessment.

    g) Owner/Operators will be required to participate in Project orientation developed for Owner/Operators, prior to commencing work on the Project.

    h) Contractor(s) shall not be responsible to compensate Owner/Operators for any costs, expenses, charges, damages or lost compensation or benefits of any nature or kind as a result of downtime to Equipment caused by required maintenance or repairs or waiting for maintenance or repairs or any other reason.

    i) Contractor(s) have the right to select or determine the nature, type, size or any other specifications of Equipment before the Owner/Operators commences work.

j) Owner/Operators must provide to the Contractor and/or the Association, upon request, proof of Equipment registration, proof of registration and good standing with Workplace, Health, Safety & Compensation Commission, proof of Equipment insurance, proof of liability insurance in an amount to be determined by the Contractor and subject to the approval of the Association, and inspection certificates when requested.

INTERNATIONAL UNION OF BRICKLAYERS AND ALLIED CRAFTWORKERS AND LOCAL UNION 1

1.0 APPLICATION

1.01 This Trade Appendix shall apply to the following:

Group 1: Bricklayer
Precast Welder and Erector
Cement Finisher
Plasterer
Tile and Terrazzo Mechanic
Epoxy Applicator
Fireproofer

Group 2: Tile Helper
Masonry Helper

Group 3: Caulker, Pointer, Cleaner
Brickpaver
Masonry Water Proofer

Apprentice
Foreperson & General Foreperson

1.02 The Foreperson shall receive fifteen (15%) percent over the Journeyperson rate. A General Foreperson shall receive twenty (20%) percent over the Journeyperson rate.

Mixer/Helper and Forklift/Helpers shall receive one dollar ($1.00) per hour over the Masonry Helper rate when the fifth Helper is hired (per job).

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be ten percent (10%) percent of gross wages including over-time for all employees.

3.0 BENEFIT FUNDS

3.01 The Contractor shall remit the amounts in the attached Wage and Benefit Schedule for each hours earned. Payments shall be made no later than the 15th of the month following the month in which the hours were earned.

3.02 Each payment shall be accompanied by a statement setting out the names of the employees in respect of whom such payment is made, the amount paid in respect of each employee, and the hours worked by each employee during the calendar month for which payment is being made.

3.03 Payments shall be made as follows:

(a) Health and Welfare Fund

Address: Atlantic Provinces Health and Welfare Trust Fund
1216 Sand Cove Road, Unit 32
Saint John, NB E2M 5V8

Cheque payable to: Atlantic Provinces Health and Welfare Trust Fund

(b) Pension Fund

Address: I.U. of B.A.C. Pension Fund
1216 Sand Cove Road, Unit 32
Saint John, NB E2M 5V8

Cheque payable to: I.U. of B.A.C. Pension Fund

(c) BAC Industry Fund

Address: I.U. of B.A.C. Organizing Fund
631 CBS Highway
Conception Bay South NL A1A 7L4

Cheque payable to: I.U. of B.A.C. Organizing Fund

(d) Training Fund

Address: I.U. of B.A.C. Training Fund
631 CBS Highway
Conception Bay South NL A1A 7L4

Cheque payable to: Training Fund

(e) Industry Fund (RDTC)

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Resource Development Trades Council Industry Fund

(f) Canadian Building Trades Fund

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Canadian Building Trades Fund NL

4.0 UNION DUES

4.01 Subject to Article 6 of the Agreement, each Contractor shall deduct from the employee's wages the appropriate monthly dues, percentage and initiation fee as per the Union referral slip each month. International Union Dues shall also be deducted as per the Union referral slip.

4.02 These dues shall be forwarded to:

Address: B.A.C. Local 1
631 CBS Hwy
Conception Bay South NL A1A 7L4

4.03 Payment of dues shall be made not later than fifteen (15) days after the end of the calendar month for which the dues were collected.

5.0 REFRACTORY:

5.01 Workers engaged on firebrick refractory work, furnace repair, acid tile, epoxy coating or similar work shall work in accordance with the four Province Agreements covering same.

6.0 APPRENTICES

6.01 Apprentices shall become indentured as soon as possible under the provisions of the Apprenticeship Act of the Province. The document of Indenture shall not conflict in any way with the provisions of this agreement.

6.02 The probationary period for apprenticeship shall not exceed four (4) months from the time the apprenticeship period started.

6.03 The Apprenticeship Standards for the trade of Bricklayers and Masonry, approved April 28, 1954, shall continue to remain in force and effect except where any provision of such Standards may conflict with any provision of this agreement.

6.04 Apprentices shall be given one-year credit for pre-job training at BAC Masonry College or any Provincial Vocational.

6.05 An apprentice shall not replace the mason's helper.

Apprentices shall receive the following percentage of a Journeyperson's rate:

First six months in the trade 56%
Second six months in the trade 62%
Third six months in the trade 68%
Fourth six months in the trade 74%
Fifth six months in the trade 80%
Sixth six months in the trade 85%
Seventh six months in the trade 90%
Eight six months in the trade 95%
Full Journeyman's rate thereafter.

The third six months and thereafter shall be the percentages for the three year apprenticeship of a Cement Mason.

7.0 HEIGHT PAY

7.01 The premium above the regular hourly rate shall be paid to employees required to work at heights under such conditions; temporary staging, scaffolding, tower like structures or structures with a direct drop of (50) feet or more shall receive one dollar ($1.00).

8.0 TOOLS

8.01 Cement Finishers shall provide and maintain the following tools:

One 6' tape	Hand floats-one wood, one metal
One 11" trowel	One hammer
One 14" trowel	One spirit level
One pointing trowel	One brush – excluding wash brushes
One side edger	

All tools to be in serviceable condition

8.02 Bricklayers shall provide and maintain the following tools:

1 Brick Trowel	3 Jointers—1/2", 5/8", ¾"
1 Brick Hammer	1 10' Space rule
1 Pointing Trowel	2 Slicks—¼" and ½"
1 Brick Set	1 4'-0" Level

**INTERNATIONAL BROTHERHOOD OF BOILERMAKERS,
IRON SHIP BUILDERS, BLACKSMITHS, FORGERS,
AND HELPERS AND LOCAL UNION 203**

1.0 APPLICATION

1.01 This Trade Appendix shall apply to the following:

General Foreperson
Foreperson
Assistant Foreperson (Working)
Journeyperson
Apprentice
Helper

1.02 On crews of six (6) members or less (including the Foreperson) the Foreperson shall be allowed to work with the tools. The Union recognizes that there may be situations where a General Foreperson, Foreperson or Assistant Foreperson is required to work with the tools to provide instructions on work procedures or where safety is a compelling factor.

1.03 The use of General Forepersons will be determined by management.

1.04 The Assistant Foreperson (working) shall receive a premium of one dollar and seventy cents ($1.70) per hour above the Journeyperson rate.

1.05 The Non-Working Foreperson shall receive a premium of three dollars and five cents ($3.05) per hour above the Journeyperson rate.

1.06 The General Foreperson shall receive a premium of four dollars and fifteen cents ($4.15) per hour above the Journeyperson rate.

1.07 The Helper shall receive seventy-five percent (75%) the Journeyperson rate.

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be twelve (12%) percent of gross wages including over-time for all employees.

3.0 BENEFIT FUNDS

3.01 The Contractor shall remit the amounts in the attached Wage and Benefit Schedule for each hour earned. Payments shall be made no later than the 15th of the month following in which the hours were earned.

3.02 Each payment shall be accompanied by a statement setting out the names of the employees in respect of whom such payment is made, the amount paid in respect of each employee, and the hours worked by each employee during the calendar month for which payment is being made.

3.03 Payments shall be made as follows:

(a) Health and Welfare Fund

Address: J.J. McAteer & Associates Inc.

45 McIntosh Drive
Markham, ON L3R 8C7

Cheque payable to: Boilermakers National Benefit Fund's (Canada)

St. John's, NL A1E 3T9

Cheque payable to: Resource Development Trades Council Industry Fund

(j) Canadian Building Trades Fund

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Canadian Building Trades Fund

4.0 UNION DUES

4.01 Union Dues as per Article 6 shall be forwarded to:

Address: Boilermakers Local 203
PO Box 250
Holyrood, NL A0A 2R0

5.0 APPRENTICES

5.01 All Apprentices shall be employed in accordance with the provisions of the *Apprenticeship Act*. Apprentices shall be given the support of the Journeyperson working on the job on which the Apprentices are employed, and the supervision of the Foreperson and, under the guidance of the Journeyperson, they may perform rigging, fitting, welding, layout work or any other part of the trade of a Journeyperson Boilermaker.

5.02 Apprentices shall receive the following percentage of a Boilermaker Journeyperson's rate:

First Year	60%
Second Year	75%
Third Year	90%

6.0 HEALTH AND SAFETY

6.01 The Contractor shall supply at no cost to the employee when required by the work he/she is to perform: safety hats, new sweat bands, new liners, appropriate welding gloves, welding helmets, welding and burning goggles, appropriate welding leathers (i.e. Jackets, capes and/or sleeves), non-prescription safety glasses and leather faced gloves (unless special processes dictate otherwise).

Cheque Payable to: Canadian Building Trades Fund

4.0 UNION DUES

4.01 Each Contractor shall deduct from the employee's wages the appropriate monthly dues, percentage and initiation fee as stipulated under Article 6 of the Agreement.

4.02 These dues will be forwarded to:

Address: IBEW Local 2330
1082 Thorburn Road
Portugal Cove
St. Phillip's, NL A1M 1V8

4.03 Payment of dues shall be made not later than fifteen (15) days after the end of the calendar month for which the dues were collected.

5.0 GENERAL

5.01 Only employees who have been instructed in the proper use of explosive actuated tools will be permitted to use them, and no employee shall be discriminated against for refusing to use such tools.

5.02 First and second year apprentices shall not be permitted to use explosive actuated tools.

5.03 There shall be two (2) journeypersons assigned to work on energized circuits of 220 volts or over, when circuits cannot be de-energized or where there is no obvious danger.

6.0 APPRENTICES

6.01 The employment of apprentices shall be in accordance with the Apprenticeship Act and Regulations and Amendments thereto. The Contractor shall maintain where practical, an equal number of each class of apprentices in his/her employ. Hiring of new apprentices shall be done (Subject to Article 7 and 34) in accordance with maintaining the equal number of each class of apprentice where practical.

6.02 If a Contractor lays off a third or fourth year apprentice, he shall not be replaced by a second or third year apprentice while there are third or fourth year apprentices unemployed in the immediate area.

6.03 First, second and third year apprentices shall work under the direct supervision of a journeyperson, fourth year apprentice shall not supervise any other apprentice.

6.04 An apprentice shall not be used as a storeroom man, warehouseman or Truckdriver for a continuous period of more than two (2) months.

6.05 Apprentice Rates of Pay:

The rates for apprentice will be as follows:

First year	55% of journeyperson's Hourly Rate
Second year	65% of journeyperson's Hourly Rate
Third year	70% of journeyperson's Hourly Rate
Fourth year	80% of journeyperson's Hourly Rate

A fourth year apprentice must write his/her journeyperson examination within twelve (12) months of obtaining his/her fourth year status, provided he/she has the required hours.

If the apprentice does not write the examination, then his/her rate of pay will be 75% of the journeyperson's rate.

7.0 RATES OF PAY

7.01 Working Foreperson's rate shall be five (5%) percent above a Journeyperson's hourly rate.

7.02 Non-working Foreman's rate of pay shall be ten (10%) percent above a journeyperson's hourly rate of pay.

7.03 The General Foreman's rate of pay shall be fifteen (15%) percent above a journeyperson's hourly rate of pay.

7.04 Apprentice Electricians/Electricians performing welding shall receive five (5%) percent above the journeyperson's hourly rate of pay.

8.0 HEIGHT PAY

8.01 Employees required to work on smoke stacks, structural steel, towers, from a bosun's chair or bucket, staging, or other areas which are fifteen (15) to thirty (30) meters shall receive an additional ten (10%) percent of his/hers straight basic hourly rate while on such work. If over thirty (30) meters, the pay will be one and one half times (1 ½) the straight basic hourly rate while on such work.

8.02 The height shall be measured from the employees standing or sitting surface position while working to the first permanent floor, planked in floor, formed in surface or metal deck or to the ground, whichever is higher. Height pay shall be paid in no less than one (1) hour increments.

9.0 TOOLS

9.01 Journeypersons shall be required to have:

1	8" Linesman Pliers	1	Channellocks
1	Side Cutting Pliers	1	Needle Nose Pliers
1	Tool Box	1	Metal Rule, 3 meter minimum
1	Knife	1	Philips Head Screwdrivers #6, 8 and 10
1	Robertson Head Screwdrivers #6, 8 and 10	1	Set Allen Key Wrenches up to ½"
1	Straight Head Screwdrivers	1	Meter, A/C, Amps/Volts/Ohms
1	Hacksaw Frame	1	Ball Peen Hammer
1	Flashlight	1	Set Socket Head or Nut Drivers
1	Box End Wrenches or Adjustable Wrench		

9.02 Apprentices shall supply themselves with the following basic tools for each year and be in possession of a complete list of tools upon becoming a journeyperson:

FIRST YEAR – BASIC TOOLS

1	8" Pliers	1	Channellocks
1	Knife	1	Tool Box
3	Robertson Head Screwdrivers #6, 8 and 10	1	Tape, 10' minimum
3	Straight Head Screwdrivers		

SECOND YEAR – ADDITIONAL TOOLS

1	Hacksaw Frame	1	Ball Peen Hammer
1	Locksaw		

THIRD YEAR – ADDITIONAL TOOLS

1	Side Cutting Pliers	1	Needle Nose Pliers
3	Phillips Head Screwdrivers #6, 8 and 10	1	Box End or Adjustable Wrench

FOURTH YEAR – ADDITIONAL TOOLS

1	Set Socket or Nut Drivers

9.03 The Contractor shall furnish all other necessary tools or equipment. Employees will be held responsible for the tools issued to theme provided the Contractor furnishes the necessary lockers, gang boxes or other safe places for storage.

UNITED BROTHERHOOD OF CARPENTERS AND JOINERS OF AMERICA AND MILLWRIGHTS, LOCAL UNION 1009

1.0 APPLICATION

1.01 This Trade Appendix shall apply to the following:

Millwright General Foreperson
Millwright Non-Working Foreperson
Millwright Working Foreperson
Millwright Journeyperson
Millwright Welder
Millwright Apprentice
Machinist

The ratios of Forepersons shall be:

1 – 7 Employees	1 Working Foreperson
8 – 15 Employees	1 Non-Working Foreperson
16 – 20 Employees	1 General Foreperson 1 Non-Working Forepersons
21 – 25 Employees	1 General Foreperson 2 Non-Working Forepersons
26 – 35 Employees	1 General Foreperson 4 Non-Working Forepersons
36 – 47 Employees	2 General Forepersons 5 Non-Working Forepersons
Each additional eight (8) Employees	One (1) Non-Working Foreperson
Each additional thirty (30) Employees	One (1) General Foreperson

The Rate of Pay for Forepersons and General Forepersons shall be:

Working Foreperson	10% above Journeyperson base rate of pay
Non-Working Foreperson	15% above Journeyperson base rate of pay
General Foreperson	20% above Journeyperson base rate of pay

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be thirteen (13%) percent of gross wages including over-time for all employees.

3.0 BENEFIT FUNDS

3.01 The Contractor shall remit the amounts in the attached Wage and Benefit Schedule for each hour earned. Payments shall be made no later than the 15th of the month following the month in which the hours were earned.

3.02 Each payment shall be accompanied by a statement setting out the names of the employees in respect of whom such payment is made, the amount paid in respect of

each employee, and the hours worked by each employee during the calendar month for which payment is being made.

3.03 A member who is currently in receipt of a Millwright 1009 Union pension may request in writing to have the pension amount applied to their basic hourly wage. Such request to change benefit contributions may be made annually between April 1 and April 30 and shall be implemented no later than June 1. This amount will not result in an increase in vacation and holiday pay.

3.04 Payments shall be made as follows:

(a) Health and Welfare Fund

Address: ACRC Joint Contributions Fund
c/o Belmont Financial Services
3 Ralston Avenue, Burnside Industrial Park
Dartmouth, NS B3B 1H5

Cheque payable to: ACRC Health & Wellness Trust

(b) Pension Fund

Address: ACRC Joint Contributions Fund
c/o Belmont Financial Services
3 Ralston Avenue, Burnside Industrial Park
Dartmouth, NS B3B 1H5

Cheque payable to: ACRC Health & Wellness Trust

(c) Building and Training Fund

Address: Millwright Local 1009
Box 3040
Paradise NL A1L 3W2

Cheque payable to: Millwright Local 1009

(d) Organizing Fund

Address: Atlantic Canada Regional Council
1000 Sackville Drive
Lower Sackville NS A1L 3W2

Cheque payable to: Atlantic Canada Regional Council

(e) Stabilization Fund

Address: Millwright Local 1009
Box 3040
Paradise, NL A1L 3W2

Cheque payable to: Millwright Local 1009

(f) Industry Fund (RDTC)

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's NL A1E 3T9

Cheque payable to: Resource Development Trades Council Industry Fund

(g) Canadian Building Trades Fund

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque Payable to: Canadian Building Trades Fund

4.0 UNION DUES

4.01 Union dues as per Article 6 shall be forwarded to:

Address: Atlantic Canada Regional Council
1000 Sackville Drive
Lower Sackville NS, A1L 3W2

Cheque payable to: Atlantic Canada Regional Council

The Union Dues and Organizing amounts shall be submitted on one cheque.

4.02 The employer shall deduct each month from the wages of each employee within the Union Jurisdiction 3.5% of basic hourly rate

5.0 APPRENTICES

5.01 Apprentice pay rate:

1st year	0 – 1,000 hours – 60% of journeyperson rate of pay 1,001 – 2,000 hours – 65% of journeyperson rate of pay
2nd year	2,001 – 3,000 hours - 70% of journeyperson rate of pay 3,001 – 4,000 hours – 75% of journeyperson rate of pay
3rd year	4,001 – 5,000 hours - 80% of journeyperson rate of pay 5,001 – 6,000 hours – 85% of journeyperson rate of pay
4th year	6,001 – 7,000 hours – 90% of journeyperson rate of pay 7,001 – 8,000 hours – 95% of journeyperson rate of pay

5.02 Apprentices will receive an increase of 5% of Journeyperson's rate for each 6 months worked or 1000 hours worked, whichever is greater. The required Block Training will have to be completed prior to advancing to the next year Apprentice pay rate.

6.0 TOOLS

6.01 Every employee must have and maintain a proper kit of tools and it shall be the responsibility of the Contractor in conjunction with the Shop Steward to check the employee's tools to be sure he/she has and maintains the required tools. This shall be a condition of employment.

6.02 Upon commencement of employment, an employee must present to the Contractor a list and value of personal tools of his/her kit.

6.03 Apprentices shall not be required to supply precision tools, such as a micrometer or precision levels, but must be expected to have some of the tools of the trade as befits their experience.

7.0 HEALTH AND SAFETY

7.01 The Contractor shall supply approved safety helmets and such other safety equipment as the employee is not required to provide, and when necessary, shall supply rain suits and rubber boots at no charge to the employee. Tools, safety equipment and other attire furnished by the Contractor shall be at the responsibility of the employee subject to normal wear and tear and shall be returned on the termination of employment or as the Contractor may require.

8.0 WELDERS

8.01 Millwright welders shall receive $0.80/hr in addition to the basic hourly rate for welding, burning or grinding on stainless steel, chrome-moly, galvanized or other alloy materials.

UNITED ASSOCIATION OF JOURNEYMEN AND APPRENTICES OF THE PLUMBING AND PIPEFITTING INDUSTRY OF THE U.S. AND CANADA, AND LOCAL UNION 740

1.0 APPLICATION

1.01 This Trade Appendix shall apply to all aspects of the Plumbing and Pipefitting industry:

Apprentice
Journeyperson
Welding Inspectors
Foreperson
General Foreperson

1.02 The Rate of Pay for Forepersons and General Forepersons shall be as follows:

Foreperson	115% of the applicable Journeyperson's rate
General Foreperson	120% of the applicable Journeyperson's rate

2.0 VACATION AND RECOGNIZED HOLIDAY PAY

2.01 Payment for annual vacations and pay in lieu of recognized holidays shall be ten (10%) percent of gross wages including over-time for all employees.

3.0 BENEFIT FUNDS

3.01 The Contractor shall remit the amounts in the attached Wage and Benefit Schedule for each hour earned. Payments shall be made no later than the 15th of the month following the month in which the hours were earned.

3.02 Each payment shall be accompanied by a statement setting out the names of the employees in respect of whom such payment is made, the amount paid in respect of each employee, and the hours worked by each employee during the calendar month for which payment is being made.

3.03 Payments shall be made as follows:

(a) Pension, Health and Welfare, and Building, Training and Resource Fund

Address: Newfoundland Plumbers & Pipefitters
PO Box 156
Mount Pearl, NL A1N 2C2

Cheque payable to: Newfoundland Plumbers & Pipefitters Trust Fund

(b) Industry Fund (RDTC)

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1C 5J2

Cheque payable to: Resource Development Trades Council Industry Fund

(c) Canadian Building Trades Fund

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1C 5J2

Cheque payable to: Canadian Building Trades Fund

4.0 UNION DUES

4.01 Union Dues as per Article 6 shall be forwarded to:

Address: Newfoundland Plumbers & Pipefitters
PO Box 156
Mount Pearl, NL A1N 2C2

5.0 APPRENTICES

5.01 All apprentices shall work under the direct supervision of a working Journeyperson Plumber or Fitter at all times.

5.02 The Apprentice Wage Rate shall be as follows:

(a) Second year – 65% of Journeyperson's rate
(b) Third year – 75% of Journeyperson's rate
(c) Fourth year – 85% of Journeyperson's rate

5.03 In the event a Contractor intends to utilize two (2) Apprentices to one (1) Journeyperson as per Article 34 of the Agreement, such Contractor must have consultation with the Union prior to implementing this ratio.

6.0 HEIGHT PAY

6.01 The following premiums above the regular hourly rate shall be paid to employees required to work at heights under such conditions as Temporary Staging, Scaffolding, Tower Like Structures or Structures with a direct drop of 40ft. or more:

40 to 64 feet	50 cents per hour
65 to 89 feet	60 cents per hour
90 to 124 feet	70 cents per hour
125 feet and up	Time and one half the hourly rate

7.0 WELDING TESTS

7.01 All welders to be engaged in work under this Trade Appendix shall be tested at the UA Local 740 Training Center prior to commencement of employment. By mutual agreement, exceptions will be made for workers referred to Site whose principal residence is outside of Newfoundland.

7.02 No welder shall be dispatched unless he/she has current tickets to perform work required.

8.0 SPECIAL CONDITIONS

8.01 Tools shall be supplied by the Contractor. When piping tool cribs or piping stock rooms are required on piping projects covered under the terms of this Agreement, they must be manned by all United Association Local 740 members. The employer agrees to give every consideration to older or handicapped employees to fill positions in such piping tool cribs or piping stock rooms.

8.02 All journeymen fitters, welders, and apprentices working on stainless steel, chrome-moly, galvanized or other alloy piping which are being burnt or ground and all heliarc and argon welding on heavy wall piping 120 schedule and up shall receive $0.80 cents above the applicable rate of pay.

8.03 Where an employee is required to perform his duties in an abnormally dirty area, he/she shall be provided with coveralls and respirators (at the employees request) while performing his/her duties.

8.04 All tacking and welding on piping shall be done by a qualified welder only. Welding mitts and goggles shall be supplied to the welder also to the fitter while he/she is fitting for the welder. Welding jackets shall be provided to the welders as a tool crib item.

8.05 Where an employee is required to perform his/her duties in an area heated in excess of 100 degrees F, he/she shall receive $1.00 per hour above the normal rate of pay.

8.06 The Contractor shall name hire from any source all Welding Inspectors and they shall be paid the Foreman's rate of pay. It shall be the responsibility of the Contractor to identify qualifications for all Welding Inspectors and to ensure they meet this criteria prior to employment. It is acknowledged that the Contractor may also employ Welding Engineers or Quality Assurance who shall inspect in accordance with all applicable Industry Codes and Specifications and shall not be subject to this Agreement.

Address: Atlantic Canada Regional Council
1000 Sackville Drive
Lower Sackville NS B4E 0C2

Cheque payable to: Atlantic Canada Regional Council

(c) Stabilization Fund, Building & Training Fund

Address: UBC Local 579
Box 3040
Paradise NL A1L 3W2

Cheque payable to: UBC Local 579

(d) Industry Fund (RDTC)

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's NL A1E 3T9

Cheque Payable to: Resource Development Trades Council Industry Fund

(e) Canadian Building Trades Fund

Address: Resource Development Trades Council of Newfoundland and Labrador
78 Brookfield Road
St. John's NL A1E 3T9

Cheque Payable to: Canadian Building Trades Fund

4.0 APPRENTICES

4.01 Rates for apprentices shall be as herein contained.

Period	# of Hours Complete	Courses Complete	Rate of Journeypersons Pay
Carpenter Helper	0	0	60%
First	1000	18	65%
Second	2200	19 – 20	70%
Third	4200	21 – 22	80%

Fourth	6200	23 – 24	90%
Journeyperson	7200	All	100%

4.02 The United Brotherhood of Carpenters and Joiners of America, Local 579 will be recognized as the sole employer of all union Carpenter Apprentices in the Province of Newfoundland and Labrador for the purpose of apprenticeship training. Further, the Brotherhood of Carpenters and Joiners of America, Local 579 will be given full authority to remove any carpenter apprentice for failure to fulfill his or her apprenticeship contract obligations. Further, each apprentice will be able to return to his/her job after the proper in school training, if the job is continuing.

4.03 Each candidate fort apprenticeship must have successfully completed a high school program or equivalent and in addition may be required to have completed certain academic subjects as specified in particular plans of training. Mature students, at the discretion of the Provincial Director of Institutional and Industrial Education, may be registered. A Mature student is defined as one who has reached the age of 19 and who can demonstrate the ability and the interest to complete the requirements for certification.

4.04 The direct entry apprentice's (with no work or school experience) starting rate will be 60% of the Journeyperson's rate. When they attain the maximum hours and successfully complete the maximum courses for that period they will receive the next wage scale increase. When the apprentice finishes one period of training and schooling, they will not get an increase in pay regardless of how many hours they have accumulated until they present a validated Log Book and have returned to school again.

4.05 The term of apprenticeship for Carpenters shall be 7200 hours actually occupied in the trade, and successful completion of all courses.

4.06 The Contractor will endeavour to hire certified Carpenters.

5.0 TOOLS

5.01 Employees will supply the following tools:

Carpenters Apron
Measuring Tape
Plumb Bob with line
Sliding Square
Combination Square
Pencils
Hammer
Level
Screw Driver Set
Framing Square
Wood Chisels
Stair Buttons/Square Gauges
Block Plane
Chalk Box with line
Claw Bar

6.0 UNION DUES

6.01 Union dues as per Article 6 of the Agreement shall be included in the same cheque as the Organizing Fund cheque as per Article 3.03(b).

6.02 The Contractor shall deduct each month from the wages of each employee within the Union Jurisdiction four (4%) percent of gross earnings, excluding room and board, vacation pay and travel expenses. These deductions shall be made on a weekly basis.

7.0 HEIGHT PAY

7.01 Employees working on a swing stage, scaffold, ladder, bosun chair or temporary working platform (excluding platforms that are in good condition, solidly constructed, rigidly fixed to the structure by mechanical means and equipped with wire mesh fencing to prevent falling) shall receive a premium over his/her regular rate as follows:

Forty (40) feet and over	$1.75/hour

Heights shall be determined on the basis of vertical free fall to the base of the structure.

8.0 HEALTH AND SAFETY

8.01 On all heavy industrial jobs, the Contractor shall supply weather appropriate coveralls that are necessary for the employee, who shall return them on completion of the job.

8.02 The following safety apparel will be made available in the manner indicated, as required by work being done on sites:

(a) Hard Hat
(b) Safety Glasses – non-prescriptive
(c) Safety Vests
(d) Goggles, face shield
(e) Safety ear protection
(f) Gloves
(g) Dust Masks

Employees will be issued this equipment. Should any of the provided safety items be made unserviceable through normal wear and tear during the employees continued employment with the Contractor, a new item will be given to the employee upon his/her presenting the unserviceable item to his/her supervisor.

Pliers	Scissors
Tinsnips	

5.02 Employees shall be furnished with tools on all foam glass jobs and cutting tools for stainless steel complete with storage box for the same before the job commences. Failure for the employee to return the said tools once the job has been completed, the cost of the same shall be deducted from the employee's paycheque. When required, the employer shall also furnish banding and sealing tools, who shall be held responsible for such tools.

6.0 APPRENTICES

6.01 At the end of an Apprentice period of 8000 working hours, the employee shall be eligible to present himself before an examination board for the purpose of obtaining his competency card as an Insulation Journeyperson.

6.02 The following Apprentice rates shall be in effect for the term of the Agreement:

1st Year Apprentice	60% of Journeyperson Mechanic Rate
2nd Year Apprentice	65% of Journeyperson Mechanic Rate
3rd Year Apprentice	75% of Journeyperson Mechanic Rate
4th Year Apprentice	85% of Journeyperson Mechanic Rate

7.0 OTHER CONDITIONS

7.01 Employees working in conditions where there is a possibility of a free fall drop shall be paid the following premiums:

40 feet and above	$1.00 per hour

7.02 The Contractor will supply gloves and disposable coveralls and will compensate for the clothing ruined on jobs on which excessive amounts of mastic and adhesives are used.

Address: Manion Wilkins & Associates Ltd.
222 Rowntree Dairy ltd., Unit 4, 3rd Floor
Woodbridge, ON L4L 9T2

Cheque payable to: The Canadian Elevator Industry Education Plan

(d) Industry Fund (RDTC)

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque payable to: Resource Development Trades Council Industry Fund

(e) Canadian Building Trades Fund

Address: Resource Development Trades Council of
Newfoundland and Labrador
78 Brookfield Road
St. John's, NL A1E 3T9

Cheque payable to: Canadian Building Trades Fund

4.0 UNION DUES

4.01 Union Dues as per Article 6 shall be forwarded to:

Address: International Union of Elevator Constructors Local 125A
Suite 102, 14 McQuade Lake Cres.
Halifax, NS
B3S 1B6

5.0 APPRENTICES

5.01 The wage rates for employees shall be in accordance with the following schedule:

Probationary Helper I	50% of the Mechanic's rate
Probationary Helper II	55% of the Mechanic's rate
Helper I	70% of the Mechanic's rate
Helper II	75% of the Mechanic's rate
Improver Helper	80% of the Mechanic's rate

5.02 It is agreed by the Union that there shall be no restrictions placed on the character of work which a Helper may perform under the direction of a Mechanic.

5.03 The total number of Helpers employed shall not exceed the number of Mechanics on any one job, except on jobs where two teams or more are working, one extra Helper may be employed for the first two teams and an extra Helper for each additional three teams.

Further, the Contractor may use as many helpers as best suits his/her convenience under the direction of a Mechanic in wrecking old plants and in handling and hoisting material; and on foundation work. When removing old and installing new cables on existing elevator installations, a Contractor may use two Helpers to one Mechanic.

6.0 Mechanic-in-Charge

6.01 When four (4) or more employees covered by this Trade Appendix, including the Mechanic-in-Charge, are employed on a new construction or modernization job, the Mechanic-in-Charge of the job shall have his/her hourly rate increased twelve and one-half percent (12 1/2%) for each hour worked.

When thirty (30) or more employees covered by this Trade Appendix are working on a job site, the Mechanic-in-Charge of the job shall have his/her hourly rate increased fifteen percent (15%) for each hour worked.

SCHEDULE “E”

EXTENDED WORK SCHEDULES

WORK SCHEDULE A: TWENTY-ONE (21) DAYS ON/SEVEN DAYS (7) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

a) The Work Schedule may commence on any day of the week.

b) The Work Schedule will consist of twenty-one (21) consecutive scheduled days of work followed by seven (7) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

c) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table E.

d) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

e) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled seven (7) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

f) Overtime meals will be as per the provisions of this Agreement.

g) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

Table E: Twenty-one and Seven Work Schedule (21 days of 10 hours worked, 7 days off)

Day	M	T	W	Th	F	S	Su	M	T	W	Th	F	S	Su	M	T	W	Th	F	S	Su	M	T	W	Th	F	S	Su

WORK SCHEDULE B: TEN (10) DAYS ON/FOUR (4) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

a) The Work Schedule may commence on any day of the week.

b) The Work Schedule will consist of ten (10) consecutive scheduled days of work followed by four (4) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

c) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table A.

d) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

e) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled four (4) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

f) Overtime meals will be as per the provisions of this Agreement.

g) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

2.0 T						10	10							

WORK SCHEDULE C: FOURTEEN (14) DAYS ON/SEVEN (7) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

a) The Work Schedule may commence on any day of the week.

b) The Work Schedule will consist of fourteen (14) consecutive scheduled days of work followed by seven (7) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

c) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table B.

d) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

e) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled seven (7) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

f) Overtime meals will be as per the provisions of this Agreement.

g) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

Table B: Fourteen and Seven Work Schedule (14 days of 10 hours worked, 7 days off)

DAY	M	T	W	Th	F	S	Su	M	T	W	Th	F	S	Su	M	T	W	Th	F	S	Su

2.0T						10	10						10	10							

WORK SCHEDULE D: FOURTEEN (14) DAYS ON/FOURTEEN DAYS (14) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

a) The Work Schedule may commence on any day of the week.

b) The Work Schedule will consist of fourteen (14) consecutive scheduled days of work followed by fourteen (14) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

c) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table C.

d) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

e) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled fourteen (14) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

f) Overtime meals will be as per the provisions of this Agreement.

g) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

WORK SCHEDULE E: TWENTY (20) DAYS ON/EIGHT DAYS (8) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

a) The Work Schedule may commence on any day of the week.

b) The Work Schedule will consist of twenty (20) consecutive scheduled days of work followed by eight (8) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

c) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table D.

d) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

e) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled eight (8) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

f) Overtime meals will be as per the provisions of this Agreement.

g) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

WORK SCHEDULE F: TWENTY (20) DAYS ON/TEN DAYS (10) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

h) The Work Schedule may commence on any day of the week.

i) The Work Schedule will consist of twenty (20) consecutive scheduled days of work followed by ten (10) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

j) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table D.

k) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

l) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled ten (10) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

m) Overtime meals will be as per the provisions of this Agreement.

n) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

WORK SCHEDULE G: TWENTY-EIGHT (28) DAYS ON/FOURTEEN DAYS (14) DAYS OFF

The following terms and conditions apply to employees, who work this schedule:

a) The Work Schedule may commence on any day of the week.

b) The Work Schedule will consist of twenty-eight (28) consecutive scheduled days of work followed by fourteen (14) scheduled days of rest. Each work day will consist of a shift of ten (10) regularly scheduled hours of work.

c) The scheduled hours to be worked and the scheduled hours to be paid (straight time and overtime) are detailed in Table F.

d) Work performed outside of the ten (10) regularly scheduled hours of work in a scheduled day of work or on a scheduled day of rest will be paid as per the provisions of this Agreement.

e) An employee, who is transferred to a different Work Schedule, must be provided with notice as per the provisions of this Agreement. If an employee requests a transfer and it is approved, then overtime rates will not apply for days worked in the scheduled fourteen (14) days of rest, unless any of the ensuing days worked in the new Work Schedule are a Friday, Saturday, Sunday or Recognized Holiday in which case the applicable over-time rate will apply. If the transfer is not as a result of an employee request, overtime provisions will apply for days worked on the scheduled days of rest that the employee would have been entitled to under his/her previous schedule.

f) Overtime meals will be as per the provisions of this Agreement.

g) The hours set forth in this Work Schedule do not constitute a guarantee of hours of work per day.

LETTER OF UNDERSTANDING

Between:

MUSKRAT FALLS EMPLOYERS' ASSOCIATION INC.

And

RESOURCE DEVELOPMENT TRADES COUNCIL OF NEWFOUNDLAND AND LABRADOR

THE PARTIES HEREBY AGREE THAT:

Article 7.08 provides the Contractor with the ability to use working forepersons in situations that would not normally be permitted under the 'usual' arrangements for forepersons in Newfoundland and Labrador. The unique nature of the work and the remote location of the Project have necessitated these arrangements.

The agreement to these arrangements is without prejudice to future assertions of the 'usual' arrangements for foreperson.

AGREED TO this 14th day of March, 2013 at the City of St. John's, in the Province of Newfoundland and Labrador

LETTER OF UNDERSTANDING

Between:

MUSKRAT FALLS EMPLOYERS' ASSOCIATION INC.

And

RESOURCE DEVELOPMENT TRADES COUNCIL OF NEWFOUNDLAND AND LABRADOR

THE PARTIES HEREBY AGREE as follows:

a) A fuel depot shall be established on Site as soon as practicable, and no later than six (6) months after the bulk excavation Contractor for the Site commences work.

b) Prior to the installation of a fuel depot on Site, transporting of fuel around the Site and the fueling of vehicles and equipment on the Site may be done by persons who are not members of the bargaining unit.

c) Vehicles picking up or delivering garbage and waste containers on Site may be operated by persons who are not members of the bargaining unit.

d) Courier packages may be delivered or dropped off on Site by persons who are not members of the bargaining unit.

RESOURCE DEVELOPMENT TRADES COUNCIL OF NEWFOUNDLAND AND LABRADOR
("RDTC")

Re: Application of Hiring Priority – Article 7

THE PARTIES AGREE workers shall be dispatched in the following order of priority:

i) Qualified Labrador Innu;
ii) Qualified residents of Labrador who are members of the RDTC;
iii) Qualified residents of Labrador;
iv) Qualified residents of the Island of Newfoundland who are resident members of the RDTC, and
v) Qualified residents of the Island of Newfoundland.

In hiring and making referrals, both the Contractor and Union members of the RDTC will comply with the Benefits Strategy and any employment equity plan that may be applicable to qualified Labrador Innu.

AGREED to this 14th day of March, 2013 in the City of St. John's, in the Province of Newfoundland and Labrador

- and -

Resource Development Trades Council
of Newfoundland and Labrador
("RDTC")

Re: Gender Equity and Diversity Implementation

The Association and Council of Unions agree as follows:

1. To support and promote initiatives and plans for employment diversity.

2. To provide full access to employment opportunities for and employment of qualified women and qualified members of underrepresented groups (aboriginals, persons with disabilities and members of visible minorities).

3. To implement proactive programs and practices that contribute to the creation of an inclusive work environment consistent with the policies established for the Project and commitments in the Gender Equity and Diversity Program.

4. To achieve diversity objectives, the Parties have agreed to the name hiring provisions set out in Article 7.07(c) & (d).

5. The Collective Agreement will not frustrate access to employment for underrepresented groups.

EXHIBIT 12
SITE CONDITIONS

1 CONTRACTOR'S WORK AREA

1.1 Worksite Location

The Worksite location is generally indicated in Part 1, Instruction to Bidders and more fully explained in Exhibit 1, Scope of Work.

1.2 Site Location

The Site location is indicated on the drawings provided in Exhibit 1, Attachment 2 and more specifically on the following drawings:

Nalcor Document No. SNC-Lavalin Document No.	Title
MFA-SN-CD-0000-CV-PL-0004-01 505573-300A-41DD-0003-	Muskrat Falls - Lower Churchill River –Plan and profile
MFA-SN-CD-3000-GT-GA-0001-01 505573-3331-41DD-0100	Muskrat Falls - Intake and Powerhouse, Spillway and Transition Dams - General Layout Plan
MFA-SN-CD-2000-CV-GA-0001-01 505573-300A-41DD-0012	Muskrat Falls - Access Roads, Accommodations and Laydown Areas

1.3 Area for Contractor Site Administration Office

The Company will provide the Contractor with an area adjacent to the Administration Complex, for the installation of the Contractor's main Site administration office. Utilities, such a potable water, sewage and electrical services will be made available for this office. It is the Contractor`s responsibility to hook up these services except for electrical power hook-up which will be performed by the Company.

1.4 Contractor Laydown Area

The Company will provide a laydown area to the Contractor in the Company Laydown Area, with an area of approximately five thousand square meters (5,000 m^2), to install its temporary facilities and storage. The Company Laydown Area is shown on the Drawings in Exhibit 1, Attachment 2. The precise locations available for the Contractor's use will be subject to the Engineer's approval.

1.5 **Work Area**

The Contractor will be permitted to install its trailers, containers and other temporary buildings for its own use in close proximity of its work areas. The precise locations will be subject to the Engineer's approval.

1.6 **Work Areas Free of Obstruction and Maintained**

1.6.1 During the execution of the Work, the Contractor shall keep the Site reasonably free from all unnecessary obstruction and shall store or dispose of any Contractor's equipment and surplus materials and clear away and remove from the Site any wreckage, rubbish or temporary works no longer required.

Unless otherwise provided elsewhere in the Agreement, the Contractor shall, throughout the construction period, maintain its work area, laydown areas and passage ways in order to permit the safe movement of pedestrians and vehicles at all times.

1.6.2 The Company will maintain all main access roads, including occasional grading of roads, snow removal and sanding of permanent access roads. The limits of the main permanent access road are provided for on the drawings. The Company accepts no responsibility with regards to the quality of the services.

1.6.3 All maintenance and snow removal within the Contractor's work area and in the immediate vicinity of its temporary facilities and storage areas in the Company's Laydown Area shall be the Contractor's responsibility. The Contractor will obtain materials for sanding from designated sand and gravel deposits located within the Site Area as directed by the Engineer.

1.7 **Signage**

The Contractor shall be responsible to install on its temporary roads all the traffic signs to inform road users, ensure their safety and facilitate traffic. The signage shall comply with the requirements of the Technical Specification, Section 01 55 00 "Roads and Contractor's Laydown Area".

Only standard safety bulletin boards and safety signs used to identify the LCP, Company, designated representatives and the Contractor, shall be allowed on the Site, with prior approval of the Engineer.

1.8 **Construction Services**

The Contractor shall operate and maintain construction services on the basis of seven (7) days a week, 24 hours a day for the duration of his contract. At the end of the Agreement, all the facilities of construction services shall be dismantled by the Contractor and remain its property, unless otherwise indicated. The Engineer has, at any time, the right to inspect the provisional facilities of the Contractor and require changes as he deems necessary, at the expense of the Contractor. The Contractor shall submit to the Engineer, for acceptance, drawings and specifications of any construction services or installations that it intends to install in its working areas twenty (20) working days before the commencement of their installation, or as agreed upon with the Engineer.

1.9 Clearance of Site on Completion

Upon Substantial Completion of the Work, the Contractor shall clear away and remove from that part all Contractor's Equipment, surplus material, rubbish and temporary Works of every kind, and leave such part of the Site and Works clean and in a workmanlike condition to the satisfaction of the Engineer.

2 SERVICES PROVIDED TO AND BY THE CONTRACTOR AND/OR ENGINEER

2.1 Electrical Power Supply

2.1.1 Services Provided by the Company

Engineer will provide electrical power to the Worksite. The Contractor will be provided free of cost with electrical power supply at the following sites for the execution of its work:

1. One in close proximity of the Company's Laydown Area (three-phase 600 V supply);
2. One at the Powerhouse area (three-phase 600 V supply);
3. One at the Spillway (three-phase 600 V supply);

The Contractor's total electrical load shall not exceed 500 kW.

The Contractor shall limit voltage dip on starting motors to 20% at the supply point based on Company supplied transformers listed above with standard impedance.

The Contractor shall provide, install, maintain and remove upon completion of the Work at Contractor's cost all necessary equipment for Contractor's temporary electrical power requirements in the Work from the three (3) power supply points indicated above.

The Contractor shall show at any time to the Engineer that it shall not exceed a power load factor of zero point nine (0.9), either by measurement or by the installation of adequate protective devices. The Contractor shall make all necessary arrangements with the Engineer for its connections to those 3 power points. The work associated with the initial connection and final disconnection will be made by the Company at the expense of the Company. The Contractor shall supply to the Engineer the following information prior to connection to the main power system:

1. Single line diagrams
2. Protection systems on equipment and lines (relays, fuses, etc. with calculations and calibrations)
3. Cabling sizes and calculations

The Company will make every effort to maintain an uninterrupted supply of electric power, but Company cannot guarantee that there will be no interruption during the duration of the Work. Company will not be responsible for any cost to Contractor for such interruptions, variations in voltage or frequency or damage arising thereof. The Contractor shall take the necessary measures to meet its needs in case of emergency.

2.1.2 **Services Provided by the Contractor**

The Contractor shall be responsible to provide its own power supply over and above the quantity supplied by the Company, as necessary to execute its work and to provide power to its facilities, such as offices, workshops, etc. and sub-contractors' (if any) needs. The Contractor shall include the costs thereof in its lump sum prices.

2.2 **Lighting**

The Contractor shall be responsible to provide all lighting required for its work areas.

When work is done at night or when the day light is down, the contractor shall provide a minimum of 300 Lux, and the Contractor shall ensure sufficient lighting for the execution of the Work in satisfactory, efficient and secure conditions or as specified from time to time in the Technical Specifications, Exhibit 1, Attachment 1. All ducts and power lines for lighting and other electrical services shall be installed and maintained in a safe manner, fixed securely and placed as far as possible from transmission cables.

2.3 **Potable Water**

Potable water will be supplied by the Company to the Contractor at a central location inside the Accommodation Complex. The Contractor shall be responsible to pick-up the water at this point and provide all necessary equipment to distribute to the different places at the Work site. The Contractor shall be responsible to meet all standards as per the Project's Health and Safety Plan.

2.4 **Industrial Water**

The Contractor shall be responsible to provide its own supply of industrial water, either by pumping from rivers or streams or by wells.

2.5 **Heating and Ventilation**

The Contractor shall be responsible for the heating and ventilation of its facilities and for any other heating required for the execution of its work. The thermal environment and ventilation of its facilities shall be in accordance with Occupation Health and Safety Regulations.

2.6 **Dewatering and Sediment Control**

The civil contractor (CH0007) maintains its own pumping and dewatering systems in its work areas. This includes the construction, operation and maintenance of sedimentation ponds.

The Contractor shall manage, in its work areas, the rain and snow melting water, and any water the Contractor might generate by its Work, but only during installation of the sill plates and modifications of the spillway rollways for the block outs. The Contractor shall pump such water out of its work areas towards wells (not to Company's civil contractor's sediment ponds) provided by Company (or Company's other contractors) located in proximity to each of Contractor's work areas. The Contractor shall not perform any sediment control. For the purpose of this section, a Contractor work area is where the

Contractor is actually performing the type of work described above. At any other time, the Contractor shall have no responsibility to manage any water. Furthermore, the Contractor shall have no responsibility to control any other source of water, including leakage of the cofferdams installed by Company (or Company's other contractors). Company or Company's other contractor shall turn over each of Contractor's work areas in a sufficiently dry condition to allow uninhibited access to Contractor for the installation of temporary facilities and execution of the Work according to Contractor's procedures.

2.7 **Sanitary Facilities**

The Company will provide wash cars in sufficient quantities. The Contractor shall locate such facility at the most convenient place(s) in Contractor's Site and relocate them from time to time as the need arises. The Company will provide all waste collection, all stipulated sanitary cleaning required and all associated consumables and water supply.

2.8 **Cleaning of Lunch Rooms and Offices**

The Contractor shall be responsible for all the cleaning of its offices, lunchrooms, workshops and all other workplaces under its responsibility on a regular basis. Lunchroom, however, shall be cleaned after each meal or break. Such services may be subcontracted by the Contractor, at his own expenses, to the on-site Company's catering contractor, subject to the Engineer's approval.

2.9 **Waste Management**

Reference is made to the Waste Management Plan Doc No: LCP-SN-CD-0000-EV-PL-0005-01 for a detailed description.

The Contractor shall investigate the availability of local solid and liquid waste collection and disposal services. The Contractor shall ensure their waste management program has integrated the availability these services.

The Company will provide domestic trash containers to be placed at the Company's Laydown Area on the Site. The Company is responsible for the supply, installation and periodic replacement as required.

The Contractor shall be responsible for collecting all recoverable waste refuse and packing material the Contractor generates, and for disposing it within the appropriate containers (clearly identified as to its restricted content) provided by the Contractor. If the Contractor fails to take the necessary measures to comply with and/or fulfill this obligation, the Company will notify the Contractor in writing to take immediate corrective action. If the Contractor does not comply after notification by the Company, the Company will have these task completed and back-charge the costs to the Contractor.

The Contractor shall be responsible for:

Disposal of materials from the Hazardous Waste Storage Area (HWSA) to approved facilities;

Diversion of Recyclable metals from landfill disposal, collection and pickup by metals recycler and;

Collection, storage, and subsequent disposal at approved facilities of Construction waste and demolition debris.

Solid and liquid waste management is an important component of the Contractors performance. Solid and liquid waste management is a challenge in Labrador as a result of the climate, and limited management and disposal options. The Contractor must plan their solid and liquid waste management programs carefully. Provided below is a partial list of potential waste management resources. It is the Contractor's responsibility to ensure its solid and liquid waste management programs are complete.

- Potential Waste Management Resources Town of Happy Valley – Goose Bay , Municipal Landfill (4 km from town on Northwest River Road : 709 896-3321
- Pardy's Waste Management - 84A Glencoe Drive, Mount Pearl NL: 709-782-2003
- Hickey's Construction – 5 Broomfield Ave. Happy Valley Goose Bay: 709-896-3250
- J.J.' s Trucking – 16 Hillcrest Road Happy Valley Goose Bay: 709-896-5552
- Roger's Group -15 Churchill Dr. Happy Valley Goose Bay: 709-896-5041
- Woodward's – 16 Loring Dr. Happy Valley Goose Bay: 709-896-2421
- Recyclex Inc. (Hazardous Waste) – Montreal QC: 514-355-4148

2.10 Operation and Maintenance of Temporary Construction Services

The Contractor shall operate and maintain temporary construction services (such as, but not limited to, dewatering, electrical power , etc.) on the basis of seven (7) days a week, 24 hours a day for the duration of his contract. At the end of the contract, all the facilities of construction services shall be dismantled by the Contractor and remain its property, unless otherwise indicated. The Engineer has, at any time, the right to inspect the provisional facilities of the Contractor and require changes, for safety or environmental reasons as he deems necessary, at the expense of the Contractor. The Contractor shall submit to the Engineer, for acceptance, drawings and specifications of any construction services or installations that it intends to install in its working areas twenty (20) working days before the commencement of their installation, or as agreed upon with the Engineer.

3 FUEL AND FUEL MANAGEMENT

3.1 Fuel Supply

A fuel station for vehicles will be located at the Company's Laydown Area. Diesel fuel and gasoline will be available. Contractor will be charged the actual market rates at the time of the purchase.

The Contractor shall on a monthly basis and at the 1st of every month, submit to the Engineer its estimated fuel needs for the next 3 months, in order to ensure adequate supply.

The Contractor shall make arrangements with the onsite fuel supplier for its terms of payment for fuel purchased at the Site.

During the execution of the Work, the Contractor shall be responsible for its own fuel needs. The Company assumes no liability and the Contractor is responsible for all cost associated with its fuel requirements.

3.2 Fuel Management

The Contractor shall submit a monthly fuel delivery report on all fuel consumed during the month. Refer to Exhibit 6, Appendix C for the report format. The report shall be submitted to the Engineer no later than 7 days following the end of the month.

4 TELECOMMUNICATIONS

Company will provide Contractor with access to telecommunication systems and services at the Muskrat Falls construction site for business requirements. Telecommunication systems and services include, but not limited to, the following:

- Land Mobile Radio System (LMRS): Company will deploy a single LMRS for use by Company, Engineer, and all Contractors and Subcontractors at the Muskrat Falls construction site. The Company will grant access to the Contractor and Subcontractors to the infrastructure of the radio communications system. It will be the responsibility of the Contractor and its Subcontractors to acquire at its own cost the mobile and portable equipment and accessories (portable radios portable mobile radios, antennas, chargers, etc). The mobile and portable radios will be available from the same Telecommunications Services Provider (TSP) appointed by the Company for the LMRS.
- Telephone Services: Company will deploy a single wire based Telephone System at the Muskrat Falls construction site. The Contractor shall advise Company of the required number of offices it will utilize at site and Company will provide one telephone for every Contractor Office. Contractor shall provide Company with a Contractor office forecast on a monthly basis for the duration of the Contractors contract.
- Cellular and Mobile Internet Services: The Company is not deploying a cellular and mobile internet solution. However, the local telecommunication company has some cellular coverage at the Muskrat Falls construction site.
- Internet Services: Company will provide Contractor with a single wired Internet connection at the Contractor's designated office area. It is the Contractors

responsibility to distribute this Internet connection to individual Contractor's offices and devices. The Contractor is also responsible for Operation, Administration, Maintenance and Provisioning of its internal Local Area Network and end user devices, such as computers and printers, in its designated office area.

Company will provide Contractor staff with Quality of Life telecommunication systems and services during non-work hours. Recreational systems and services will include, but not limited to, the following:

- Television Services: A television will be provided in each dormitory room and designated public areas of the accommodations complex.
- Telephone Services: A wired telephone will be provided in each dormitory room and designated public areas of the accommodations complex.
- Internet Services: A physical internet connection will be provided in each dormitory room, and wireless internet will be provided in the dormitory modules and designated public areas of the accommodations complex.

5 ACCOMODATION COMPLEX

5.1 Accommodations

5.1.1 General

The Company will provide an Accommodation Complex, located approximately 10 km from the Muskrat Fall Site. At the Accommodation Complex the Company will provide room and board free of charge for the mandatory use by the Contractor's staff and its Personnel, as authorized by the Engineer. The number of employees eligible for lodging services is limited to the resources indicated in the Construction Schedule submitted by the Contractor in its Proposal. The Contractor shall submit to the Engineer at least thirty (30) days in advance, all reasons for any forecasted increases in manpower. The Engineer does not undertake to accept such requests, however, the Engineer may, at its sole discretion and subject to availability, approve these forecasted increases in manpower.

The Contractor`s Personnel will be mobilized at the Muskrat Site in compliance with Company Policy.

Employees are to be provided with identification card with photograph issued by the Engineer on their first day on site. This will then permit camp registry and room assignment, free access to the camp cafeteria and main gate ingress and egress when required.

5.1.2 Rooms

The Contractor`s Personnel will be housed in dormitories with rooms for single occupancy, including toilet, washbasin and a double occupancy (shared) shower. Each dormitory is supplied with heating and indoor and outdoor lighting and is equipped with washers and dryers placed at the disposal of its occupants. The occupants may, however, not use the washer and dryers for cleaning work clothes. Contractor is responsible for providing washers and dryers for cleaning work clothes of its Personnel. The Company provides free cable services, local phone services, internet services and a television set for each room. No private satellite antenna is permitted. The costs of long distance telephone calls shall be the responsibility of each Contractor`s Personnel.

5.1.3 Board

Two (2) hot meals are served every day in the cafeteria (breakfast and supper). The cold meal for the middle of the work shift is available to the Contractor`s Personnel during the previous meal at the cafeteria.

5.2 Emergency Services

The company will provide a third party medical service provider, fully-equipped first aid room and emergency vehicles for contractors' access, free of charge.

The Company will provide an emergency vehicle on the Site. The emergency vehicle will be operated and maintained by the Company.

5.3 Security Services

The Company will maintain a security service for the protection of all facilities and property. Regular security patrols will take place within the camp boundaries to protect its facilities, equipment and residents.

The Company takes no responsibility for any loss or damage of any kind incurred by Contractor's Personnel.

5.4 Fire Protection

The Company will provide overall fire-fighting capacity for the Worksite, while Contractor shall be responsible for fire prevention and fire watch activities for the Work.

5.5 Recreation

Recreation facilities will be made available to the Contractor`s Personnel.

5.6 Banking Services

An ATM banking machine will be made available to the Contractor`s Personnel.

5.7 Convenience Store

The Contractor`s Personnel will have access to a small convenience store offering variety items deemed appropriate for construction site. The Contractor`s Personnel are responsible for the cost of all purchases.

5.8 Drugs and Alcohol

The Site shall be drug and alcohol free, in accordance with the requirements of LCP-PT-MD-0000-LR-SD-0001-01, Standard for Drug and Alcohol.

Every employee of the Contractor shall be drug and alcohol free while at work.

In addition, employees and Contractor shall not be permitted to possess or sell prohibited drugs or alcohol or, be in possession of any item or piece of equipment for the use of or administration of a prohibited drug at the Site.

The objective of the requirements contained in this Policy is to improve the safety of staff, Contractors and customers through reducing the risk created by the use of drugs and alcohol in the workplace.

6 PROHIBITION OF COMMERCIAL TRADE

Commercial activities are prohibited on the Site.

7 RESPONSIBILITY OF THE CONTRACTOR

The Contractor is responsible for any and all replacement costs of items assigned to the Contractor's Personnel during their assignment at the Site.

8 TRANSPORT

8.1 Private Vehicles

Private vehicles are not allowed on the Site or Accommodation complex.

8.2 Access to Site

The Site is accessible as follows:

8.2.1 By Road

The Site is located approximately thirty (38) km from the town of Happy Valley-Goose Bay (HV-GB). The route follows the Trans Labrador Highway for approximately ten (10) km south of HV-GB and a gravel road of approximately twenty (20) km which leads to the Company's Laydown Area.

8.2.2 Port Facilities

The Happy Valley-Goose Bay and Cartwright port facilities are accessible by road to Site. Contractor is responsible for obtaining, from the appropriate Authority, the restrictions and requirements in using those facilities and associated services.

8.2.3 Bridges

The Contractor is responsible for completing a logistics study to determine any restrictions in shipping material and equipment to and from the Site.

8.2.4 By Air

The Site is serviced by the Happy Valley - Goose Bay airport. Air transport of passengers is provided by various commercial airlines such as:

1. Air Canada
2. Air Labrador
3. INNU Mikun Airlines
4. PAL (Provincial Airlines)

The Contractor shall be responsible for all airline bookings for all travel needs of the Contractor's personnel.

The Contractor shall be responsible for all transportation cost and expenses of the Contractor's personnel to and from Goose Bay Airport and other destinations, wherever they may be located.

8.3 Transportation to the Site

The Company will provide mandatory scheduled bus service between Goose Bay, North West River and Sheshatshiu and between Goose Bay, Goose Bay Airport and the

Accommodation Complex to transport all Contractor's Personnel and their personal belongings.

Company takes no responsibility for any inconvenience that may be caused due to normal mechanical failure, adverse weather conditions or other causes out of its control.

The Contractor shall be responsible for transportation between the Goose Bay or other place and the Site for any material, equipment, tools, or other requirements associated with the Work.

8.4 **Transportation between the Accommodations Complex and Work Locations.**

The Contractor is responsible to provide the necessary transportation of the Contractor`s Personnel between the Accommodations Complex and Work locations on the Site.

EXHIBIT 13

PROVINCIAL BENEFITS

1.0 Scope

Company has agreed to a Lower Churchill Construction Project Benefits Strategy (http://www.nr.gov.nl.ca/nr/energy/lcp_benefits_strategy.pdf) with the Province of Newfoundland and Labrador. This Benefits Strategy outlines all contracts, purchasing, and employment benefits objectives for the Lower Churchill Project (LCP). As well, Company has signed the Lower Churchill Innu Impacts and Benefits Agreement (IBA) with Innu Nation. Contractors are required to adhere to applicable obligations contained in this agreement.

Also the Government of Newfoundland and Labrador has entered into a Memorandum of Understanding (MOU) with the Government of Nova Scotia regarding industrial and employment benefits respect to the Maritime Link transmission project. Details of these MOU can be found at (http://www.releases.gov.nl.ca/releases/2011/nr/1128n06.htm).

In this MOU the parties agree that the Company will meet the following commitments in regard to the construction of the Muskrat Falls Plant and the Labrador-Island Link:

1. Provide Nova Scotia contractors, service providers, consultants, and suppliers with open, timely and transparent access to procurement opportunities and activities in relation to the projects;
2. Provide reasonable advance notice to the Nova Scotia supply and service community of all procurement opportunities;
3. Conduct a supplier information workshop in Nova Scotia;
4. Communicate with unsuccessful Nova Scotia proponents, when requested, to help the proponents better prepare for future opportunities.

Successful Bidder must agree to the following:

- To support the objectives and principles as committed to by Company as per the Lower Churchill Construction Project Benefits Strategy.
- To support the relevant objectives and principles contained in the IBA.
- To support the objectives and principles as committed to by Company as per the MOU.
- To make best efforts to obtain Newfoundland and Labrador Benefits content as outlined in the submitted bid. If this content can not be met, Contractor must inform Company as early as possible and provide Company with rational and mitigation strategy.

2.0 Contractor's Obligations

Contractor Shall:

- Execute commitments to Lower Churchill Construction Project Benefits Strategy and IBA as outlined in Bidder's submission.
- Provide NL companies and suppliers with full and fair opportunity to participate on a competitive basis in the supply of goods and services as per Section 2.1 of Attachment 1 – Completed Benefits Questionnaire.
- Comply with the hiring protocol as outlined in the Benefits Strategy for work performed on

the generation and transmission sites.

- Support LCP's Gender Equity and Diversity initiatives.
- Submit data reports on a monthly basis regarding employment and expenditures. Reporting tables to be supplied by Company.
- Make best efforts to fulfill commitments regarding NL bid content as stated in Attachment 1 – Completed Benefits Questionnaire.

3.0 Company Responsibilities

Company shall:

- Provide Contractor with data collection and system requirements relating to monthly Benefits Reporting.

ATTACHMENT 1

COMPLETED PROVINCIAL BENEFITS QUESTIONNAIRE

ANDRITZ Hydro

1.0 INTRODUCTION

This questionnaire is used to assess the Provincial Benefits content contained in Bidder's Proposal for the Lower Churchill Project (LCP).

Bidder is required to respond to the questions/statements outlined in this questionnaire in the format presented in the various sections herein. Accurate information, consistent with Canadian General Standards Board, is imperative. Failure to provide the information required may result in its Proposal being rejected. Information provided is subject to audit by Company. Extracts from this submission will be included in the final agreement with the Successful Bidder. Company has agreed to a Lower Churchill Construction Project Benefits Strategy (http://www.nr.gov.nl.ca/nr/energy/lcp_benefits_strategy.pdf) with the Province of Newfoundland and Labrador. This Benefits Strategy outlines all contracting, purchasing, and employment benefits objectives for the Lower Churchill Project (LCP). This strategy also outlines Company's commitments to gender equity and diversity. Successful Bidder will be required to undertake a commitment to support gender equity and diversity in the execution of Work on the LCP. All contractors are required to adhere to applicable principles and commitments contained in this strategy.

Company has signed the Lower Churchill Innu Impacts and Benefits Agreement (IBA) with Innu Nation. Bidders are required to respond to questions relating to Innu employment and procurement content. Although not a condition precedent to award, Innu content will be a consideration in the overall evaluation of bids to the degree the opportunity for Innu content exists.

Also the Government of Newfoundland and Labrador has entered into a Memorandum of Understanding (MOU) with the Government of Nova Scotia regarding industrial and employment benefits with respect to the Maritime Link transmission project. Details of this MOU can be found at (http://www.releases.gov.nl.ca/releases/2011/nr/1128n06.htm).

In this MOU the parties agree that the Company will meet the following commitments in regard to the construction of the Muskrat Falls Plant and the Labrador-Island Link:

1. Provide Nova Scotia contractors, service providers, consultants, and suppliers with open, timely and transparent access to procurement opportunities and activities in relation to the projects;
2. Provide reasonable advance notice to the Nova Scotia supply and service community of all procurement opportunities;
3. Conduct a supplier information workshop in Nova Scotia;
4. Communicate with unsuccessful Nova Scotia proponents, when requested, to help the proponents better prepare for future opportunities.

ANDRITZ Hydro

2.0 BIDDER'S UNDERSTANDING AND COMMITMENT TO NEWFOUNDLAND AND LABRADOR BENEFITS AND IBA COMMITMENTS

2.1 Contracting and Procurement

The LCP is committed to supporting the accrual of benefits for the people of Newfoundland and Labrador, while executing the LCP on an economic basis adhering to competitive business practices. In support of this commitment, Bidder shall work to promote opportunities in Newfoundland and Labrador while maintaining the economic viability of the LCP through application of best value in the acquisition of goods and services. For purposes of this Appendix, best value is defined as a blend of total cost, quality, commitment to safety, technical suitability, credit worthiness, delivery and continuity of supply and services, where total cost is comprised of initial purchase price plus operation and maintenance costs. Within this framework, if successful, Bidder shall with respect to services and Work being performed for the LCP:

(a) provide suppliers and contractors in Newfoundland and Labrador with full and fair opportunity to participate on a competitive basis in the supply of goods and services;

(b) become familiar with Newfoundland and Labrador contractor/supplier capabilities, and size and design packages in a manner that recognizes these capabilities;

(c) make the request for proposal processes, names and locations of key procurement personnel available to potential Newfoundland and Labrador suppliers and contractors where appropriate; and

(d) require benefits information as part of the request for proposal processes in sufficient detail to assess the benefits to be derived from a proposal, including requiring bidders to complete a Provincial Benefits questionnaire as part of that process.

Bidders are asked to respond to the following:

2.1 a) Describe Bidder's experience with implementing local benefits strategies and agreements

2.1 b) Describe Bidder's procurement policies and procedures that will ensure reasonable advance notice to Newfoundland and Labrador (NL) supply community of all procurement opportunities

2.1 c) Describe Bidder's familiarity with NL contractor/supply capabilities. If Bidder is not currently familiar with these capabilities, describe proposed steps to ensure familiarity

2.2 Employment

A hiring protocol, consistent with the Canadian Charter of Human Rights and Freedoms, has been established for the LCP as outlined below.

For work at the Generation Site (Muskrat Falls hydroelectric generating facility, HVac transmission line to Churchill Falls) the protocol is as follows:

- Qualified and Experienced Members of Innu Nation
- Qualified and Experienced Residents of Labrador
- Qualified and Experienced Residents of Newfoundland
- Qualified and Experienced Canadians
- Qualified and Experienced Non-Canadians

For work on the HVdc Transmission system the protocol is as follows:

- Qualified and Experienced Residents of Newfoundland and Labrador
- Qualified and Experienced Canadians
- Qualified and Experienced Non-Canadians

Bidders are asked to respond to the following:

2.2 a) Describe Bidder's familiarity with the Newfoundland and Labrador workforce

2.2 b) Describe Bidder's human resource policies that will optimize NL employment benefits

2.3 Gender Equity and Diversity

Gender Equity and Diversity plans are being developed. These plans will address employment equity, including access to employment opportunities for qualified members of under-represented groups. For the purpose of this bid, under represented groups are defined as women, aboriginal people, persons with disabilities and visible minorities.

Bidders are asked to respond to the following:

2.3 a) Does Bidder have gender equity and diversity plans? If so, describe Bidder's policies, including harassment and discrimination policies that support gender equity and diversity.

2.3 b) Does Bidder's human resource policies enable the voluntary identification of members of under represented groups.

2.4 Benefits Reporting

Company will be required to monitor and report on certain LCP activities relating to employment and procurement. To assist in this effort, Successful Bidder will be required to submit data reports on a monthly basis regarding employment and expenditures. Company will provide a mechanism for submitting this information.

Employment data reporting is required for direct labour associated with the Work. Work is defined as the following:

1. Labour performed at the hydro-electric generating station located at Muskrat Falls plus HVac transmission.

2. Direct labour associated with the construction of a HVdc system comprised of high voltage overhead lines from central Labrador to Soldiers Pond or vicinity on the Island of Newfoundland.

It does not include labour associated with procured or manufactured items. Information collected will include the workforce to be broken out by occupation, work location, residency of worker, aboriginal affiliation and gender. Category classifications to be provided by Company. Expenditure data will also be collected. This will include total value of goods and services purchased from business within the province as well as value of goods and services purchased from Innu businesses.

Bidder is asked to respond to the following:

2.4 a) Indicate Bidder's previous experience at capturing employment and expenditure data as they relate to local benefits monitoring.

2.4 b) Identify who, within Bidders organization, will be responsible for benefits monitoring and reporting.

3.0 Impacts and Benefit Agreement with Innu Nation

Company has signed an Impact and Benefits Agreement with Innu Nation. This agreement includes obligations relating to employment, training, procurement and workplace polices. Although not a condition precedent to award, Innu content will be a consideration in the overall evaluation of bids to the degree the opportunity for Innu content exists.

It is on this basis that Bidders are to respond to the following:

3.0 a) Is the bidder registered as an Innu Company with the Innu Business Development Corporation (IBDC)?

3.0 b) List any intended subcontractors/ suppliers that are currently IBDC registered Innu companies.

3.0 c) Identify who, within Bidders organization, will be responsible for benefits monitoring and reporting and communication of procurement opportunities to the IBDC.

3.0 d) Identify the number, if any, of personnel submitted with this bid who are members of Innu Nation.

3.0 e) Provide any other relevant information relating to Innu content and this RFP, including Bidder's experience with Aboriginal IBAs.

4.0 NEWFOUNDLAND AND LABRADOR BENEFITS CONTENT – PERSON HOUR ESTIMATE

Bidder is required to provide, where applicable, an estimate of the direct labour (in person hours) used to complete the Work. Information should be categorized in terms of work location and residency of the workers, as outlined in the tables below.

Bidder is asked to complete the following:

ANDRITZ Hydro

4.0 a) Employment Estimate by Residency

Employment Category	NL (Hours)	Other Canada (Hours)	Foreign (Hours)	Total (Hours)
Management / Staff	0%	95%	5%	100%
Engineering	0%	10%	90%	100%
Procurement and Contracting	0%	55%	45%	100%
Construction and Assembly	183,710	367,420	0	551,130
Other (Fabrication shops)	0%	10%	90%	100%
Total (hours)	183,710	n/a	n/a	n/a

4.0 b) Employment Estimate by Location of Work

Employment Category	Labrador (Hours)	Island of Newfoundland (Hours)	Other Canada (Hours)	Foreign (Hours)	Total (Hours)
Management / Staff	102,375	0%	20%	5%	100%
Engineering	0%	0%	10%	90%	100%
Procurement and Contracting	9,013	0%	5%	45%	100%
Construction and Assembly	551,130	0	0	0	551,130
Other (Fabrication shops)	0%	0%	10%	90%	100%
Total (hours)	662,518	0	n/a	n/a	n/a

5.0 NEWFOUNDLAND AND LABRADOR BENEFITS CONTENT – EXPENDITURE ESTIMATE

Bidder is required to provide an estimate of the expenditure percentages associated with the Work. Information should be categorized as Newfoundland and Labrador, Other Canadian and Foreign Content using the Expenditure Table below.
Bidder is asked to complete the following:

5.0 a) Expenditure Estimate Table

	NL	Other Canadian	Foreign	Total
Materials and Equipment	1%	9%	30%	40%
Direct Labour and Staff	22%	3%	5%	30%
Services	5%	10%	2%	17%
Overhead and Profit "Included in the other numbers"	n/a	n/a	n/a	n/a
Other	1%	10%	2%	13%
Total	29%	32%	39%	100%

PERFORMANCE SECURITY

PERFORMANCE BOND

No. _____ $

KNOW ALL MEN BY THESE PRESENTS THAT

_____ as Principal, hereinafter called the Principal, and _____, a corporation created and existing under the laws of _____ , and duly authorized to transact the business of Suretyship in , as Surety, hereinafter called the Surety, are held and firmly bound unto _____ as Obligee, hereinafter called the Obligee, in the amount of _____ Dollars, ($_____) lawful money of Canada, for the payment of which sum, well and truly to be made, the Principal and the Surety bind themselves, their heirs, executors, administrators, successors and assigns, jointly and severally, firmly by these presents.

WHEREAS, the Principal has entered into a written contract with the Obligee, dated the _____ day of _____, for _____ in accordance with the contract documents submitted therefore which are by reference made part hereof and are hereinafter referred to as the Contract.

NOW, THEREFORE, THE CONDITION OF THIS OBLIGATION is such that if the Principal shall promptly and faithfully perform the Contract then this obligation shall be null and void; otherwise it shall remain in full force and effect.

Whenever the Principal shall be, and declared by the Obligee to be, in default under the Contract, the Obligee having performed the Obligee's obligations thereunder, the Surety may promptly remedy the default, or shall promptly

1. complete the Contract in accordance with its terms and conditions or
2. obtain a bid or bids for submission to the Obligee for completing the Contract in accordance with its terms and conditions, and upon determination by the Obligee and the Surety of the lowest responsible bidder arrange for a contract between such bidder and the Obligee and make available as work progresses (even though there should be a default, or a succession of defaults, under the contract or contracts of completion, arranged under this paragraph) sufficient funds to pay the cost of completion less the balance of the Contract price; but not exceeding, including other costs and damages for which the Surety may be liable hereunder, the amount set forth in the first paragraph hereof. The term "balance of the Contract price", as used in this paragraph, shall mean the total amount payable by the Obligee to the Principal under the Contract, less the amount properly paid by the Obligee to the Principal.

Any suit under this Bond must be instituted before the expiration of two (2) years from the date on which final payment under the Contract falls due.

The Surety shall not be liable for a greater sum than the specified penalty of this Bond.

The attached Rider, signed by the Principal and the Surety, is part of and incorporated into this Bond.

No right of action shall accrue on this Bond, to or for the use of, any person or corporation other than the Obligee named herein, or the heirs, executors, administrators, assigns or successors of the Obligee.

IN WITNESS WHEREOF, the Principal and the Surety have Signed and Sealed this Bond this day of _____ .

RIDER TO PERFORMANCE BOND NO.

TO BE ATTACHED TO AND FORM PART OF PERFORMANCE BOND NO._____ , dated concurrently with the execution of this Rider, issued by the _____ , as Surety, on behalf of _____ , as Principal, and in favour of _____, as Obligee.

WHEREAS, upon the request of the Principal and Obligee, and in consideration of $1.00 and other valuable consideration the receipt and sufficiency of which is acknowledged by the Surety, **IT IS UNDERSTOOD AND AGREED THAT** the above described bond is hereby amended to include the following paragraphs:

1. Surety hereby waives notice of any change to the Contract or the related subcontracts, including changes to time of performance, scope of work and price.
2. No waiver by the Obligee of any provision of the Contract shall release the Surety of its obligations given under this Bond although in no event shall the obligations of the Surety under the Bond exceed those of the Principal.
3. To the limit of the amount of this Bond, if there is a failure by the Principal to perform or otherwise to fulfil its obligations under and comply with the terms of the Contract which has neither been remedied by the Principal or expressly waived by the Obligee in writing, and if the Principal is declared in default and the Surety is called upon under this Bond, then the Surety is obligated to the Obligee for all obligations of the Principal under the Contract, including:
   (a) the responsibilities of the Principal for correction of defective design, work and materials, and for completion of the Contract;
   (b) the fulfilment by the Principal of all Performance Guarantees, as defined and specified in the Contract; and
   (c) the obligation to pay liquidated damages, as specified in the Contract.
4. For purposes of any suit under this Bond, final payment shall be deemed to fall due on the date of Final Completion as shown on the Final Completion Certificate, as defined in the Contract.
5. This Performance Bond shall expire two (2) years after the date of Final Completion as shown on the Final Completion Certificate, as defined in the Contract.

IT IS FURTHER UNDERSTOOD AND AGREED THAT nothing herein shall be held to change, alter or vary the terms of the above described Bond except as hereinbefore set forth.

IN WITNESS WHEREOF, the Principal and the Surety have Signed and Sealed this Performance Bond Rider this_____day of_____.

To: *(COMPANY'S LEGAL NAME)*
(address)

From: *(ISSUING BANK)*
(address)

Subject: Our Irrevocable Standby Letter of Credit - Performance Number *(#)*

WHEREAS *(legal name of Contractor)* having its head office at *(address of Contractor)* (hereinafter referred to as the "Applicant"), has signed a contract bearing the effective date of *(insert date)*, and reference number *(insert number)* with **Muskrat Falls Corporation** having its head office at 500 Columbus Drive, St. John's, NL A1B 0C9 (hereinafter referred to as the "Beneficiary"), for the Supply and Installation of Powerhouse Hydro/Mechanical Equipment (hereinafter referred to as the "Contract");

WHEREAS under Article 7 of the Contract, the Applicant is required to provide to the Beneficiary an Irrevocable Standby Letter of Credit - Performance in the amount of **(10)** % of the Contract Price, which amount being *(insert)* Dollars *($*****)* to secure the performance of its obligations under the Contract;

We, (*name and address of bank)* (hereinafter referred to as the "Bank"), for the account of the Applicant, hereby issue in favor of the Beneficiary our transferable Irrevocable Standby Letter of Credit – Performance in the amount of *(insert)* Dollars *($****)* (hereinafter referred to as the "Credit"). We hereby irrevocably and unconditionally undertake to pay to the Beneficiary at sight, without protest or notification, and without inquiring any further proof or conditions, and without consideration for any objections or protests which the Applicant may make, any sum or sums not exceeding the aggregate sum of *(insert)* Dollars *($****)*, free of all imposts, taxes, duties, charges, fees, withholdings and/or deductions whatsoever both present and future, of any nature whatsoever and by whomsoever imposed, and without set-off or counterclaim, upon presentation to the Bank of a demand in writing duly signed by two (2) Beneficiary's officers against this Credit, provided the demand is in the form set out in Exhibit "**A**" hereto, which forms an integral part of this Credit, and that such demand is made no later than on the *(insert)* day of *(insert month, year)* (hereinafter referred to as the "Expiry Date") or any new expiry date (as defined below). Only the Beneficiary or a transferee may make drawings under this Credit.

This Credit shall be automatically extended for one (1) year periods from the Expiry Date or from any subsequent expiry date (hereinafter referred to as "New Expiry Date") successively, unless the bank sends by express courier to the Beneficiary at the above-mentioned address, with a copy to the Applicant, a written notice at least sixty (60) days prior to the Expiry Date or a New Expiry Date, stating that the Bank elects not to extend this Credit for any such additional period. In the event the Bank elects not to extend the Expiry Date or any New Expiry Date of

this Credit, then the Bank hereby unconditionally and irrevocably undertakes to pay to the Beneficiary the total amount then outstanding under this Credit upon presentation to the Bank by the Beneficiary, prior to the Expiry Date or the New Expiry Date, of a demand for payment stating that the Bank has elected not to extend this Credit and that the Beneficiary is therefore entitled to such payment, provided the demand is in the form set out in Exhibit "**B**" attached hereto, which forms an integral part of this Credit.

Notwithstanding the foregoing, in no event will this Credit extend beyond *(insert date)* (hereinafter referred to as the "Final Expiry Date").

This Credit may be automatically reduced by a certificate issued by the Beneficiary to the Bank stating the amount of reduction applicable to this Credit and presented to the Bank by the Applicant or the Beneficiary.

The terms of this Credit set forth in full the terms of our undertaking and this undertaking is not in any way modified, amended or amplified by reference to any document, instrument referred to in this Credit, or in which this Credit is referred to, or to which this Credit is related, and any such reference does not incorporate by reference any document, instrument or agreement.

Partial drawings are authorized. All costs related to this Credit are for the account of the Applicant.

THIS CREDIT IS TRANSFERABLE IN WHOLE BUT NOT IN PART TO ONE OR MORE NOMINATED TRANSFEREE THAT IS THE SUCCESSOR IN INTEREST TO THE BENEFICIARY. EACH TRANSFER MUST BE ISSUED BY ROYAL BANK OF CANADA, GLOBAL LOANS ADMINISTRATION, 4TH FLOOR, 20 KING STREET WEST, TORONTO, ONTARIO, M5H 1C4, UPON RECEIPT OF THE ORIGINAL IRREVOCABLE STANDBY LETTER OF CREDIT - PERFORMANCE AND BENEFICIARY'S SIGNED LETTER OF TRANSFER IN THE FORM SET OUT IN EXHIBIT 'C' ATTACHED HERETO (SIGNATURE(S) VERIFIED BY A BANK) AND OUR TRANSFER CHARGES PAID BY THE BENEFICIARY. WE WILL EFFECT THE TRANSFER, PROVIDED THAT THE TRANSFER COMPLIES WITH APPLICABLE LAW AND IS NOT A TRANSFER TO AN ENTITY THAT THE BANK IS PROHIBITED TO DEAL WITH.

This Letter of Credit is subject to the Uniform Customs and Practice for Documentary Credits (2007 Revision) of the International Chamber of Commerce (ICC Publication no. 600) and for matters not covered by the Uniform Customs and Practice for Documentary Credits (2007 Revision) of the International Chamber of Commerce, (ICC Publication no. 600) it shall be governed by and interpreted in accordance with the laws of the Province of Newfoundland and Labrador and the laws of Canada, applicable therein.

WHEREAS, ANDRITZ HYDRO CANADA INC., HAVING ITS HEAD OFFICE AT 6100 AUT. TRANSCANADIENNE, POINTE-CLAIRE, QUEBEC, H9R 1B9 (HEREINAFTER REFERRED TO AS THE "APPLICANT"), HAS SIGNED A CONTRACT BEARING THE EFFECTIVE DATE OF JANUARY 2, 2013, AND REFERENCE NUMBER CH0030 WITH NALCOR ENERGY HAVING ITS HEAD OFFICE AT 500 COLOMBUS DRIVE, ST. JOHN'S, NEWFOUNDLAND AND LABRADOR, A1B 0C9 (HEREINAFTER REFERRED TO AS THE "BENEFICIARY"), FOR THE MUSKRAT FALLS CH0030 PROJECT (HEREINAFTER REFERRED TO AS THE "CONTRACT");

WHEREAS UNDER ARTICLE 7 OF THE CONTRACT, THE APPLICANT IS REQUIRED TO PROVIDE TO THE BENEFICIARY AN IRREVOCABLE STANDBY LETTER OF CREDIT - PERFORMANCE IN THE AMOUNT OF 15% OF THE CONTRACT PRICE, BEING CAD25,045,360.00 (TWENTY FIVE MILLION FORTY FIVE THOUSAND THREE HUNDRED SIXTY AND 00/100'S CANADIAN DOLLARS) TO SECURE THE PERFORMANCE OF ITS OBLIGATIONS UNDER THE CONTRACT;

WE, ROYAL BANK OF CANADA, GLOBAL LOANS ADMINISTRATION, 4TH FLOOR, 20 KING STREET WEST, TORONTO, ONTARIO, M5H 1C4 (HEREINAFTER REFERRED TO AS THE "BANK"), FOR THE ACCOUNT OF THE APPLICANT, HEREBY ISSUE IN FAVOR OF THE BENEFICIARY OUR TRANSFERABLE IRREVOCABLE STANDBY

LETTER OF CREDIT - PERFORMANCE IN THE AMOUNT OF CAD25,045,360.00 (TWENTY FIVE MILLION FORTY FIVE THOUSAND THREE HUNDRED SIXTY AND 00/100'S CANADIAN DOLLARS) (HEREINAFTER REFERRED TO AS THE "CREDIT").

WE HEREBY IRREVOCABLY AND UNCONDITIONALLY UNDERTAKE TO PAY TO THE BENEFICIARY AT SIGHT, WITHOUT PROTEST OR NOTIFICATION, AND WITHOUT INQUIRING ANY FURTHER PROOF OR CONDITIONS, AND WITHOUT CONSIDERATION FOR ANY OBJECTIONS OR PROTESTS WHICH THE APPLICANT MAY MAKE, ANY SUM OR SUMS NOT EXCEEDING THE AGGREGATE SUM OF CAD25,045,360.00 (TWENTY FIVE MILLION FORTY FIVE THOUSAND THREE HUNDRED SIXTY AND 00/100'S CANADIAN DOLLARS), FREE OF ALL IMPOSTS, TAXES, DUTIES, CHARGES, FEES, WITHHOLDINGS AND/OR DEDUCTIONS WHATSOEVER BOTH PRESENT AND FUTURE, OF ANY NATURE WHATSOEVER AND BY WHOMSOEVER IMPOSED, AND WITHOUT SET-OFF OR COUNTERCLAIM, UPON PRESENTATION TO THE BANK OF A DEMAND IN WRITING DULY SIGNED BY TWO (2) BENEFICIARY'S OFFICERS AGAINST THIS CREDIT, PROVIDED THE DEMAND IS IN THE FORM SET OUT IN EXHIBIT 'A' HERETO, WHICH FORMS AN INTEGRAL PART OF THIS CREDIT, AND THAT SUCH DEMAND IS MADE NO LATER THAN ON JANUARY 14, 2014 (HEREINAFTER REFERRED TO AS THE "EXPIRY DATE") OR ANY NEW EXPIRY DATE (AS DEFINED BELOW). ONLY THE BENEFICIARY OR A TRANSFEREE MAY MAKE DRAWINGS UNDER THIS CREDIT.

THIS CREDIT SHALL BE AUTOMATICALLY EXTENDED FOR ONE (1) YEAR PERIODS FROM THE EXPIRY DATE OR FROM ANY SUBSEQUENT EXPIRY DATE (HEREINAFTER REFERRED TO AS "NEW EXPIRY DATE") SUCCESSIVELY, UNLESS THE BANK SENDS BY EXPRESS COURIER TO THE BENEFICIARY AT THE ABOVE-MENTIONED ADDRESS ALSO COPY TO THE APPLICANT, A WRITTEN NOTICE AT LEAST SIXTY (60) DAYS PRIOR TO THE EXPIRY DATE OR A NEW EXPIRY DATE, STATING THAT THE BANK ELECTS NOT TO EXTEND THIS CREDIT FOR ANY SUCH ADDITIONAL PERIOD. IN THE EVENT THE BANK ELECTS NOT TO EXTEND THE EXPIRY DATE OR ANY NEW EXPIRY DATE OF THIS CREDIT, THEN THE BANK HEREBY UNCONDITIONALLY AND IRREVOCABLY UNDERTAKES TO PAY TO THE BENEFICIARY THE TOTAL AMOUNT THEN OUTSTANDING UNDER THIS CREDIT UPON PRESENTATION TO THE BANK BY THE BENEFICIARY, PRIOR TO THE EXPIRY DATE OR THE NEW EXPIRY DATE, OF A DEMAND FOR PAYMENT STATING THAT THE BANK HAS ELECTED NOT TO EXTEND THIS CREDIT AND THAT THE BENEFICIARY IS THEREFORE ENTITLED TO SUCH PAYMENT, PROVIDED THE DEMAND IS IN THE FORM SET OUT IN EXHIBIT 'B' ATTACHED HERETO, WHICH FORMS AN INTEGRAL PART OF THIS CREDIT. NOTWITHSTANDING THE FOREGOING, IN NO EVENT WILL THIS CREDIT EXTEND BEYOND FEBRUARY 10, 2018 (HEREINAFTER REFERRED TO AS THE "FINAL EXPIRY DATE").

THIS CREDIT MAY BE AUTOMATICALLY REDUCED BY A CERTIFICATE ISSUED BY THE BENEFICIARY TO THE BANK STATING THE AMOUNT OF REDUCTION APPLICABLE TO THIS CREDIT AND PRESENTED TO THE BANK BY THE BENEFICIARY.

THE TERMS OF THIS CREDIT SET FORTH IN FULL THE TERMS OF OUR UNDERTAKING AND THIS UNDERTAKING IS NOT IN ANY WAY MODIFIED, AMENDED OR AMPLIFIED BY REFERENCE TO ANY DOCUMENT, INSTRUMENT REFERRED TO IN THIS CREDIT, OR IN WHICH THIS CREDIT IS REFERRED TO, OR TO WHICH THIS CREDIT IS RELATED, AND ANY SUCH REFERENCE DOES NOT INCORPORATE BY REFERENCE ANY DOCUMENT, INSTRUMENT OR AGREEMENT.

PARTIAL DRAWINGS ARE AUTHORIZED. ALL COSTS RELATED TO THIS CREDIT ARE FOR THE ACCOUNT OF THE APPLICANT.

THIS CREDIT IS TRANSFERABLE IN WHOLE BUT NOT IN PART TO ONE OR MORE NOMINATED TRANSFEREE THAT IS THE SUCCESSOR IN INTEREST TO THE BENEFICIARY. EACH TRANSFER MUST BE ISSUED BY ROYAL BANK OF CANADA, GLOBAL LOANS ADMINISTRATION, 4TH FLOOR, 20 KING STREET WEST, TORONTO, ONTARIO, M5H 1C4, UPON RECEIPT OF THE ORIGINAL IRREVOCABLE STANDBY LETTER OF CREDIT - PERFORMANCE AND BENEFICIARY'S SIGNED LETTER OF TRANSFER IN THE FORM SET OUT IN EXHIBIT 'C' ATTACHED HERETO (SIGNATURE(S)VERIFIED BY A BANK) AND OUR TRANSFER CHARGES PAID BY THE
